Signing up to cut emissions means China will have to move away from coal power

The US and China - together responsible for 40% of the world's carbon emissions - have now both ratified the Paris global climate agreement.

After arriving with other leaders of G20 nations for a summit in the city of Hangzhou, Mr Obama said: "History will judge today's effort as pivotal."

CO2 emissions are the driving force behind climate change.

Last December, countries agreed to cut emissions enough to keep the global average rise in temperatures below 2C.

What is climate change?

What does the climate deal mean for me?

The Paris deal is the world's first comprehensive climate agreement. It will only come into force legally after it is ratified by at least 55 countries, which between them produce 55% of global carbon emissions.

Members of China's National People's Congress Standing Committee adopted "the proposal to review and ratify the Paris Agreement" on Saturday morning at the end of a week-long session.

Analysis: BBC environmental analyst Roger Harrabin

This is a big step towards turning the Paris climate agreement into reality.

Other nations will still tussle over their own ratification, but this will put pressure on

G20 nations over the weekend to move faster with their pledge to phase out subsidies to fossil fuels. But even if enough other players step forward to make the Paris deal law, huge challenges lie ahead.

Before China made its announcement, the 23 nations that had so far ratified the agreement accounted for just over 1% of emissions.

The UK has yet to ratify the Paris deal. A spokesman for the prime minister told BBC News that the government would ratify as soon as possible - but gave no date. The White House issued a statement on Saturday morning announcing the US ratification.

In a speech in Hangzhou, Mr Obama said the Paris deal was the "single best chance that have to deal with a problem that could end up transforming this planet". He praised US and Chinese leadership on the climate issue, saying: "We are moving the world significantly towards the goal we have set."

The Paris deal struck last December was seen as a major breakthrough

UN Secretary General Ban Ki-moon praised Mr Obama for what he called "inspiring" leadership.

Mr Ban said Mr Obama and China's President Xi Jinping had both been "far-sighted, bold and ambitious".

However, analysts warn that the target of keeping temperature rises below 2C is already in danger of being breached.

For 14 consecutive months meteorologists have recorded the hottest month on record, and the UK's **Met Office has forecast** that 2016 is likely to hit temperatures 1.1C above pre-industrial levels.

Average temperatures worldwide are likely to increase more in the coming years as the effect of previous carbon emissions makes itself felt.

The **G20 summit in Hangzhou** starts on Sunday.

This is expected to be Mr Obama's last trip to Asia as US president.

However, as he arrived there was a security dispute on the tarmac at Hangzhou airport as White House officials, including National Security Adviser Susan Rice, and reporters tried to get closer to the president. A Chinese official shooed them away shouting: "This is our country! This is our airport!"

Paris agreement: Key points

To keep global temperature increase "well below" 2C and to pursue efforts to limit it to 1.5C

To peak greenhouse gas emissions as soon as possible and achieve a balance between sources and sinks of greenhouse gases in the second half of this century

To review progress every five years

\$100bn a year in climate finance for developing countries by 2020, with a commitment to further finance in the future

Once the deal comes into force, countries that have ratified it have to wait for a minimum of three years before they exit

China ratifies Paris climate agreement

Signing up to cut emissions means China will have to move away from coal power

China's top legislature has ratified the Paris global climate agreement, state news agency Xinhua reports.

The country is the world's largest emitter of harmful CO₂ emissions, which cause climate change.

China and the US are expected to jointly announce ratification at a bilateral summit later on Saturday.

In a landmark deal struck in December, countries agreed to cut emissions enough to keep the global average rise in temperatures below 2C (36F).
