(8) Religious Views of Morality, Nature and Sexuality are in Fundamental Conflict with Reality: A Scientific Exegesis

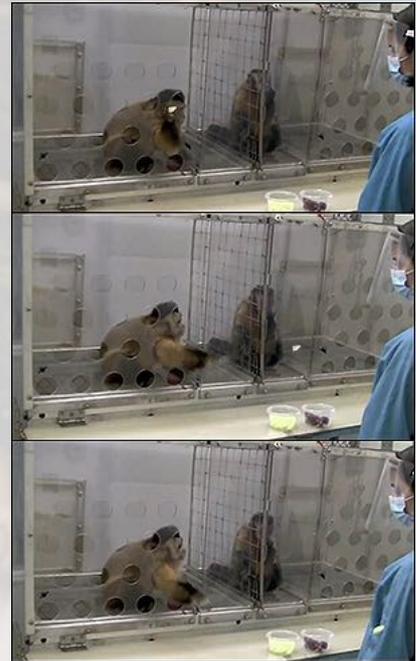

While Symbiotic Existential Cosmology doesn't deny outright that some form of super-consciousness could be co-eval with the universe, it does consider that existing religious traditions and concepts of God are in conflict with symbiotic climax living diversity as the central expression of consciousness found in the biota. The idea of absolute cosmological morality ordained by a monotheistic God or by Karmic Law flies in fundamental conflict with the biological and eco-systemic reality that morality is an evolved sociobiological trait, to aid inter-social dominance, by inhibiting intra-social competition, founded not in prescriptive rules and their transgression, but an intuitive sense of fair play.

Natural morality arises from a sense of "fair play". Intelligent animal societies engage in strategic bluffing to try to gain social advantages, and animals, from large-brained monkeys like capuchins and macaques, as well as dogs and

intelligent birds, quickly gain a long-term understanding of one another's personalities, to ensure fair play, and react with hostility in forms of altruistic punishment if they sense they are being "played" by another. Capuchin species, like humans, also adopt cultural traditions of tool use (Barrett et al. 2018).

Capuchin monkeys respond strategically to multiple scenarios (Smith et al. 2019) requiring both coordination (Assurance Game) and anti-coordination (Hawk-Dove Game), beneficial cooperation with a temptation to defect (Prisoner's Dilemma) and an environment requiring changing strategies within short temporal proximity (Alternating Economic Game). Likewise Macaques show adaptive strategies of social engagement depending on individual prowess (Zhao et al. 2023). These attest to both an intuitive sense of morality and the capacity for the same forms of conscious decision-making volition, we describe as free-will, but they are NOT religiously ordained!

Fig 150b: In a fairness study video by [Frans de Waal](#), socially acquainted capuchins are offered either cucumber or grape if they give the experimenter a stone. If they both receive cucumber, both are happy but the moment one gets a grape and the other gets only a cucumber, fair play is violated and the disadvantaged one on the left gets mad and throws the cucumber at the experimenter hitting them on the left shoulder.

Founding human societies that have lived for millennia in small bands, spend a great deal of time assessing one another's character and trustworthiness in social interactions and discussions round the camp fire, so that they know who they can depend on in times of crisis. This, not divinely ordained doctrine, is the foundation of human morality – something I call "verifiable trust".

As discussed in the next section, our longest standing culture, the [San Bushmen](#), do not invoke the notion of absolute morality, but rather an acceptance of the value of sexual opportunities, amid a sense of practicality that applies to issues like sharing versus stealing which directly affect the harmony and stability of the small bands upon which everyone's lives rely, while the deities are not morally prescriptive and are not cast in terms of absolute good and evil:

When a missionary inquired into a Bushman's ideas of good and bad he was told it was 'good' to sleep with another man's wife, but 'bad' if he slept with yours.

It is only with the emergence of dominant human culture, in larger urban societies, succeeding the gather-hunter epoch, where there is no longer any natural biospheric feedback on defection, that individual choices become subsumed under religious doctrine to enable large societies to dominate others, by repressing individual choice through punitive doctrine in the dictated common interest, but at a high cost.

Both Creationism, the widespread religious notion that the universe was created by a divine act of God and that of the Day of Judgment, as a final act, likewise arise from the emergence of human manufacturing culture, involving tools, weapons, wheels and struts for building, surrounded by animal husbandry and agriculture, so that we arrive at notions of God creating humanity by moulding from clay, breathing life into the dust of the Earth through prana, or the verbal commands that leaders invoke – "Let there be light!"

Fig 150c: The Code of Hammurabi 1792-1750 BCE shows both that, although "ordained" by Shamash, the Laws were codified by a secular ruler Hammurabi, not a priest as Moses was, and that the very notion of judgment under the law, is a creation of culture, not deity.

Likewise the notion of a day of judgment is a cultural construct of an urban society having established prescriptive laws, which are then invoked scripturally as divine prohibitions such as "thou shalt not commit adultery", as in Moses' Ten Commandments and both Deuteronomic Law and its predecessor, the secular Code of Hammurabi. Religions do articulate moral prescriptions that figure prominently in evolutionary strategy, and so exemplify underlying natural

morality. The Hebrew “an eye for an eye and a tooth for a tooth” is a highly successful prisoners’ dilemma strategy of tit-for-tat, which however leads to cycles of defection, refined in later more generalised notions, such as the silver and golden rules “do not do unto others what you would not have them do unto you” pronounced by Rabbi Hillel, reciting the Torah standing on one foot, and Yeshua’s assertive “do unto others what you would have them do unto you”, cited by Jesus as both the law and the prophets.

Nevertheless Isaiah’s notions of absolute compassionate righteousness do result in root contradictions with nature:

But with righteousness shall he judge the poor, and reprove with equity for the meek of the earth: and he shall smite the earth with the rod of his mouth, and with the breath of his lips shall he slay the wicked. And righteousness shall be the girdle of his loins, and faithfulness the girdle of his reins (Isa 11 4-5).

These notions of divine justness hinting of divine salvation are unnatural and immediately become a religious invocation to assert a reversal of biospheric diversification into animals and plants, carnivores and herbivores:

The wolf also shall dwell with the lamb, and the leopard shall lie down with the kid; and the calf and the young lion and the fatling together; and a little child shall lead them. And the cow and the bear shall feed; their young ones shall lie down together: and the lion shall eat straw like the ox. And the sucking child shall play on the hole of the asp, and the weaned child shall put his hand on the cockatrice’ den. (Isa 11 6-8).

Fig 150d: Isaiah 11 Inset and in the far distance, the cockatrice, a mythical winged dragon.
The Peace William Strutt

Contrary to Isaiah’s proclamation, there is no such thing as natural evil, as such, because biospheric evolution promotes biological diversity and abundance, even through the rough justice of tooth and claw and parasites and disease. Just as plants directly fix incoming solar energy and animals have evolved to live off their consumption, thus favouring plant diversity by animals evolving to consume the weedy species also aiding plant seed dispersal and promoting fertilisation, so carnivores act to keep the herbivores from boom and bust of pastoral famines, and the Red Queen race of parasites and prey has given rise to organismic sexuality to resist epidemic extinctions, by introducing individual variation, when parthenogenesis is unviable long-term, due to Muller’s ratchet of mutational decay. Inevitably, although with some irony, this has resulted in the dilemma of organismic mortality, but sexual reproduction is the most altruistic form of reproduction conceivable, without which higher species could not have evolved. These all attest to a much wider, wilder reality in nature than any God of righteous order would ordain.

But the above passages are enclosed in emphatic parentheses, by what Christianity claims to be a key prophecy of the coming of Christ, stemming from King David’s father Jesse as a Davidic messiah, consecrating his cosmic destiny:

*And there shall come forth a rod out of the stem of Jesse, and a Branch shall grow out of his roots:
And the spirit of the Lord shall rest upon him, the spirit of wisdom and understanding,
the spirit of counsel and might, the spirit of knowledge and of the fear of the Lord (Isa 11 1-2).*

*They shall not hurt nor destroy in all my holy mountain: for the earth shall be full of the knowledge of the Lord,
as the waters cover the sea. And in that day there shall be a root of Jesse, which shall stand for an ensign of the people;
to it shall the Gentiles seek: and his rest shall be glorious (Isa 11 9-10).*

Taking a step back, we see that one of the most compassionate and harmonious visions of the prophets, claimed to be evidence for the cosmological coming of Christianity, are founded on the root violation of natural diversity.

But the entire edifice of Monotheistic cosmology is set around a false notion of the entire universe and space-time itself as a moral test of *Homo sapiens* as an elite, quasi divine encultured species, in dominion over a brutal nature of tooth and claw that cannot tell good from evil, by a creator deity that then destroys the entire universe in a "Day of Judgment" over the sins of each and every human being to an eternal life of divine pleasure and fulfilment in Heaven or to be cast into the fires of Hell. This is where the religious violation of nature becomes all-encompassing and

diabolical. This entire claim is erroneous because it is in central conflict with the way the natural universe manifests, in which there is no over-weening rule of moral order, but emerges from complexity at the edge of chaos.

Like cultural laws of judgment, the concept that animals do not have “free will” to make astute judgments over their fates to survive and care for their offspring is not a divine law separating humans as elite from animals, but a distorted product of human language and culture and the knowledgable ability of human beings to choose to transgress culturally and religiously ordained doctrine, which other animals do not, despite being subjectively conscious intentional sentient beings, just as we are. This right of autonomous choice, which we humans associate with free will, is also the very foundation of democratic protest and social paradigm change.

Turning to the troubled question of sex as the source of biological immortality in the eternal afterlife, one quoted Jewish opinion, the least divergent from the view of Symbiotic Existential Cosmology, runs thus:

The simple answer, as others have already pointed out, is that there is no sex in heaven because heaven refers to a nonphysical existence and sex is a physical activity. Nevertheless, traditional sources often describe the pleasures of Heaven in corporeal terms. The Zohar, in one passage, says (if I recall correctly) that every night the souls of righteous husbands and wives join together in sexual congress. Traditional Jewish sources indicate that sexual desire is actually rooted in a deeper spiritual drive, and that the pleasure of physical sex is only a pale reflection of the pleasure achieved through fulfilling that true spiritual desire. It is important to understand that "Heaven" actually plays a relatively minor role in the Jewish understanding of the afterlife. The ultimate destiny of the afterlife is the resurrection, when the physical world will be perfected and the righteous will return to eternal physical life in this world. In that world, sexual intercourse will certainly be possible, but the need and desire for physical pleasure will no longer exist.

The Christian view, that in heaven, there is no sex, no children, just winged angels, stems from the Eden account. Although the sabbatical creation of Genesis 1 is by no means the oldest chapter of the Bible and was possibly crafted in the Exile in refuting the Babylonian creation from Tiamat and Marduk, to appease the dictates of Cyrus in accepting the return of the Jews, the Fall from Eden, is ancient, ostensibly written around 950 BCE. In it humanity is implied to have lost our innocent divinity at the hands of Eve heeding the Serpent and persuading Adam to eat the forbidden fruit “to make one wise”. Their loss of innocence, covering their genitals with fig leaves then sets in motion the Fall:

*And I will put enmity between thee and the woman and between thy seed and her seed
it shall bruise thy head and thou shalt bruise his heel
Unto the woman he said I will greatly multiply thy sorrow and thy conception
in sorrow thou shalt bring forth children and thy desire shall be to thy husband and he shall rule over thee
And unto Adam he said Because thou hast hearkened unto the voice of thy wife and hast eaten of the tree
of which I commanded thee saying Thou shalt not eat of it
cursed is the ground for thy sake in sorrow shalt thou eat of it all the days of thy life
Thorns also and thistles shall it bring forth to thee and thou shalt eat the herb of the field
In the sweat of thy face shalt thou eat bread till thou return unto the ground
for out of it wast thou taken for dust thou art and unto dust shalt thou return
And Adam called his wife's name Eve because she was the mother of all living
Unto Adam also and to his wife did the LORD God make coats of skins and clothed them
And the LORD God said Behold the man is become as one of us to know good and evil
and now lest he put forth his hand and take also of the tree of life and eat and live for ever.*

ואיבה ו אשית בינך ובין האשה ובין זרעך ובין זרעה הוא ישופך ראש ואתה תשופנו עקב: ס
אל־האשה אמר הרבה ארבה עצבונך והרנך בעצב תלדי בנים ואל־אישך תשוקתך והוא ימשל־בך: ס
ולאדם אמר כִּי־שמעת לקול אשתך ותאכל מן־העץ אשר
צויתך לאמר לא תאכל ממנו ארורה האדמה בעבורך בעצבון תאכלנה כל ימי חיך:
וקוץ ודרדר תצמיח לך ואכלת את־עשב השדה:
בזעת אפיק תאכל לחם עד שובך אל־האדמה כי ממנה לקחת כִּי־עפר אתה ואל־עפר תשוב:
ויקרא האדם שם אשתו חוה כי הוא היתה אם כל־ח:
ויעש יהוה אלהים לאדם ולאשתו כתנות עור וילבשם: פ
ויאמר ו יהוה אלהים הן האדם היה כאחד ממנו לדעת טוב ורע ועתה
ו פ־ישלח ידו ולקח גם מעץ החיים ואכל וחי לעלם:

This curse of יהוה (Jehovah) has multiple components:

- (1) Enmity between woman and man and their seed ordained by God, invoking sexually-antagonistic co-evolution.
- (2) Biological conception and birth, with women travail in the pains of childbirth.
- (3) Patriarchal domination by the husband over the wife, repressing female reproductive choice.
- (4) Adversarial dominion over nature in conquering the wilderness, in animal husbandry and agriculture.
- (5) Biological mortality – dust to dust.
- (6) Adam names Eve for her fecundity of all life, as the mother of all living, initiating sexual reproduction.
- (7) God clothes them in the tokens of civilisation.

- (8) God admits that good and evil are the products of the gods themselves, who both know good and evil and have immortality, so the Tree of Immortal Life is withheld. Hence nature in Eden was not of itself evil, even from the human pair, neither was it necessarily for sex itself, until they eat the forbidden fruit and had knowledge of transgressing Yahweh's prohibition.

These in themselves constitute a massive frontal attack on natural cosmology. The ultimate conclusion, nevertheless is that natural evil does not exist, but good and evil emerge from culture and religion, due to the loss of biospheric symbiosis in the cultural epoch, in which human cultural psychopathy has no antidote, except by obeying the moral commandments of prescriptive religion. This leaves the actual status of both sexual reproduction and mortality unclarified, and is in effect cursing nature for the link between the two, while it is clear this is the curse of the gods. Sex thus becomes recognised as the source of biological mortality, and woman as the cause of it all, targeted by Augustine as the "devil's gateway".

Jesus is claimed in the Gospels to have identified Eden as the cosmological precursor in rejecting divorce, saying Moses wrote a bill of divorcement "just for the hardness of their hearts":

But from the beginning of the creation God made them male and female. For this cause shall a man leave his father and mother, and cleave to his wife; And they twain shall be one flesh: so then they are no more twain, but one flesh. What therefore God hath joined together, let not man put asunder (Mark 10).

Fig 150e: Christian views of heaven and Hell (see also Memling's "Day of Judgment" fig 209. Top: Christ the Redeemer in Glory with the Heavenly Host Niccolò Circignani Il Pomarancio (1588) and The Pilgrims ascend, (c 1910) from "The Pilgrim's Progress," John Bunyan. Bottom: The Last Judgment - Giovanni da Modena, depicts the fate of Muhammad, bound to a rock in Hell, centre right, being clawed by demons. It has been the subject of a thwarted terror attack. Stairway to heaven "Jacob's Ladder" William Blake.

When they asked him which one of seven brothers who wedded a wife on Earth and died would marry the wife in heaven, Jesus answered: (Matt 22:29):

*Ye do err, not knowing the scriptures,
nor the power of God.*

*For in the resurrection they neither marry, nor are
given in marriage, but are as the
angels of God in heaven.*

*Πλανᾶσθε μὴ εἰδότες τὰς γραφὰς μηδὲ τὴν δύναμιν τοῦ Θεοῦ.
ἐν γὰρ τῇ ἀναστάσει οὔτε γαμοῦσιν οὔτε γαμίζονται ἀλλ' ὡς
ἄγγελοι «θεοῦ» ἐν τῷ οὐρανῷ εἰσιν.*

This results in the notion that there will be no sex in Heaven in the epoch of eternal life, so that people as angels have wings to fly in the "heavens", but do not and cannot be said to have sex, or to reproduce offspring. This becomes a tragic fallacy of divine thinking, because the natural creative process of sexual variation and the evolution of novelty, just as Homo sapiens evolved from the primates, loses all meaning and any explanation. Timeless eternal life in heaven is inconsistent with the temporally elapsing physical universe in which we exist as sentient conscious volitional beings and the biological reality of the biosphere in which humanity coexists. You can neither think, nor experience, let alone pronounce the apocalypse unless time elapses. It is inconceivable for all the organisms born throughout cosmic history to have eternal life, in an imaginary Heaven, as angels dancing on the head of a pin. By contrast the generations of life ARE perennially immortal, through recombinational resilience against mutational entropy. It is fallacious cosmology to envisage that innocent people of all ages, babies to centenarians in their dotage, will go to heaven to become eternal angels of not any given biological age at all, each with wings to fly in the heavens, when we know that outer space is a vacuum where wings provide no lift.

Fig 150f: Timna: Hathor Egyptian period, Phallic Teraphim and 'Nehustan' from Midianite period.

This patriarchal view emerged from an historical Yahwistic Hebrew context, in which circumcision was the required male sacrifice to the abstract male deity, invoking male sexuality itself as the sacred procreational force:

At that time the Lord said unto Joshua, Make thee sharp knives, and circumcise again the children of Israel the second time. And Joshua made him sharp knives, and circumcised the children of Israel at Gibeath Haaraloth – the hill of the foreskins (Joshua 5).

This occurred despite Jewish descent being through the mother, having been so since the time of Laban, when the teraphim or house gods were stolen by Rachel hiding them under her menstrual skirts to found Jacob's patriliney:

Then Laban went out of Leah's tent, and entered into Rachel's tent. Now Rachel had taken the images, and put them in the camel's furniture, and sat upon them. And Laban searched all the tent, but found them not. And she said to her father, Let it not displease my lord that I cannot rise up before thee; for the custom of women is upon me. And he searched, but found not the images (Gen31).

Overthrowing a tolerant phase of Arabic culture, in which in Mecca was a pilgrimage centre for diverse beliefs, Muhammad ordained the smashing of the 360 astral idols, including images of Jesus and Mary, leaving only the black stone, believed to be of astronomical origin in the Ka'aba when there and in the surrounding centres such as Taif, were shrines to the three Goddesses al-Lat, the ancient consort of al-Llah noted in inscriptions in the Sinai desert, along with al-Uzza and Manat, who had figured prominently in Nabatean Edom in the time of Yeshua, were overthrown.

Fig 150g: Top: "The Harem" depicting 72 kohl-eyed houris Thomas Rowlandson and "The Dream of the Believer" Achille Zo.

Allah's Apostle said, "When the Day of Resurrection approaches, the dreams of a believer will hardly fail to come true"
Abu Huraira

Lower: Persian miniatures of houris and the seven layered heaven Jannah dating back to Sumeria and Inanna Goddess of Heaven echoing the 360 astral idols originally in the Ka'aba and the *banat Allah al-Lat*, al-Uzza and Manat, as accounted in the satanic verses (Armstrong 1991 113). By contrast, flesh and blood women, when they go to heaven are said to become houris.

Islam under Muhammad, attempted to solve the dilemma of inconsistency of eternal life with sexual desire and natural reproduction of biological offspring, by focussing on the sexual pleasure of men as an ultimate enticement, turning heavenly femininity into kohl-eyed houris, celestial virgins recreated anew every day, whose bodies were translucent, so you could see right through to the marrow of their bones, but whose vaginas were nevertheless overflowing with lubricious enticing pleasure and delight for men with eternal erections to assuage, especially martyrs. In Islam, heaven is utterly sexy for men, with 72 houris, or black-eyed virgins made pure anew every day:

Everyone will have two wives from the houris, (who will be so beautiful, pure and transparent that) the marrow of the bones of their legs will be seen through the bones and the flesh (Hadith Al Bukhari).

" لَا تَحَاسَدُ، لِكُلِّ امْرِئٍ زَوْجَتَانِ مِنَ الْحُورِ الْعِينِ، يُرَى مَخُّ سَوْقَيْهِنَّ مِنْ وَرَاءِ الْعِظْمِ وَاللَّحْمِ "

Every male admitted into heaven will be given eternal erections and wed to 72 wives, each having libidinous sexual organs (Sunan Ibn Majah):

There is no one whom Allah will admit to Paradise but Allah will marry him to seventy-two wives, two from houris and seventy from his inheritance from the people of Hell, all of whom will have desirable front passages [lubricious vaginas] and he will have a male member that never becomes flaccid (i.e., soft and limp) (Abu Umamah Zuhd).

“ مَا مِنْ أَحَدٍ يَدْخُلُهُ اللَّهُ الْجَنَّةَ إِلَّا زَوَّجَهُ اللَّهُ عَزَّ وَجَلَّ ثِنْتَيْنِ وَسَبْعِينَ زَوْجَةً ثِنْتَيْنِ مِنَ الْخُورِ الْعَيْنِ وَسَبْعِينَ مِنْ مِيرَاثِهِ مِنْ أَهْلِ النَّارِ مَا مِنْهُنَّ وَاحِدَةٌ إِلَّا وَلَهَا قُبُلٌ شَهِيَّةٌ وَلَهُ ذَكَرٌ لَا يَنْتَثِي ”

An old woman came to the messenger of God and asked, O Messenger of God make dua that God grants me entrance into Jannah. The Messenger of God replied, "O Mother, an old woman cannot enter Jannah." That woman started crying and began to leave. The Messenger of God said, "Say to the woman that one will not enter in a state of old age, but God will make all the women of Jannah young virgins. God Most High says, 'Lo! We have created them a (new) creation and made them virgins, lovers, equal in age (Al-Hasan Al-Basri).

“I Don't Want My Husband to Have Heavenly Maidens”, responds to a faithful woman's dilemma, under the banner of a veiled, but seductively adorned, figure:

I have read many hadiths and qur'anic verses regarding that men will be given the hoor al ayn (Heavenly Maidens) in Paradise. I believed that I was going to work on my faith together with my husband and Inshallah we would be together in Jannah. After reading more about the hoor al ayn, I just feel like I want to be single again and so I do not have to worry about meeting my husband in Paradise if I don't have one. It kills me from inside knowing that the one I truly love will be given other women just because of their lust of women. I'm sorry but, aathoobillah, it disgusts me. I always thought there will be no filth in Jannah, and that lust is a feeling of filth, so why will that exist there? Would it be permissible for me to separate from my husband? I feel like if I had no attachment with a spouse, then Inshallah I wouldn't need one in the hereafter.

The female Muslim counsellor Zainab bint Yunus asserts:

The Hoor al-Ayn (heavenly maidens) is merely one small part of the many, many rewards of Jannah. Indeed, each believer who enters Jannah will need only think of what they want, and it will be given to them. We as believing women will receive greater than anything we can imagine in comparison to the heavenly maidens. This thought should bring a great deal of comfort to our hearts. In Islam, sexual desire and feelings of lust are not considered evil or filthy; rather, they are part of our creation, as both men and women, and there is nothing wrong about having such feelings. Ask Allah to ease your heart, to renew your faith in Him, and to make you amongst the people of Jannah – with your husband.

But there are very serious contradictions in this carefully crafted view of Heaven under a male God with seemingly miraculous powers to solve all the glaring contradictions between an avowedly patriarchal religion, in which women are half the value of a man, veiled and in bondage to their male relatives and under pain of death by stoning for any autonomous reproductive choice, while men are granted explicit, unlimited, eternal sexual pleasure, and women are either consigned to be translucent houris, or given unspecified, undocumented substitute rewards.

The foundation contradictions remain. What is the meaning and purpose of unabated male sexual desire to copulate, in an eternal heaven where sexual reproduction no longer occurs? Why not higher conscious experiences of divinity transcending mere sexual infatuation, as occurs in samadhi and agape?

But the destructive anti-nature of the eschatological end-of-days becomes profoundly acute and devastating in the Day of Judgment, where in the Christian Revelation (*apokalypsis*) ἀποκάλυψις of John of Patmos, also accounted in a later section, nature is grossly and needlessly assaulted in a triage of all life after which, the Earth and its biosphere are entirely destroyed:

Fig 150h: The Angel's trumpet calls in Revelation invoke the triage of all living creatures to herald Christ's return:

The first angel sounded, and there followed hail and fire mingled with blood, and they were cast upon the earth: and the third part of trees was burnt up, and all green grass was burnt up.

And the second angel sounded, and as it were a great mountain burning with fire was cast into the sea: and the third part of the sea became blood; And the third part of the creatures which were in the sea, and had life, died; and the third part of the ships were destroyed.

And the third angel sounded, and there fell a great star

from heaven, burning as it were a lamp, and it fell upon the third part of the rivers, and upon the fountains of waters; And the name of the star is called Wormwood

And the fourth angel sounded, and the third part of the sun was smitten, and the third part of the moon, and the third part of the stars; so as the third part of them was darkened, and the day shone not for a third part of it, and the night likewise.

And the fifth angel sounded, and I saw a star fall from heaven unto the earth: and to him was given the key of the bottomless pit. And there came out of the smoke locusts upon the earth: and unto them was given power, as the scorpions of the earth have power. And it was commanded them that they should not hurt the grass of the earth, neither any green thing, neither any tree; but only those men which have not the seal of God in their foreheads.

This might sound like temporary respite at least for the plants, but the destruction doesn't stop there, going on to releasing homicidal plagues of heavenly angels who pour out the vials of the wrath of God upon the Earth, leading to the battles of the Great Whore of Babylon, Ishtar the reviled symbol of female-inspired fornication, and the Beast amid cosmological conflagration and the battles of the forces of light and darkness.

Time itself stands still in absolute eternity:

And the angel which I saw stand upon the sea and upon the earth lifted up his hand to heaven, and swore by him that liveth for ever and ever, who created heaven, and the things that therein are, and the earth, and the things that therein are, and the sea, and the things which are therein, that there should be time no longer (R 10).

Fig 150h2: *"His eyes were as a flame of fire, and on his head were many crowns".* Would you buy a used car from this man?

The avenging Lord of divine justice eventually appears:

And I saw heaven opened, and behold a white horse; and he that sat upon him was called Faithful and True, and in righteousness he doth judge and make war. His eyes were as a flame of fire, and on his head were many crowns; and he had a name written, that no man knew, but he himself. And he was clothed with a vesture dipped in blood: and his name is called The Word of God. And the armies which were

in heaven followed him upon white horses, clothed in fine linen, white and clean. And out of his mouth goeth a sharp sword, that with it he should smite the nations: and he shall rule them with a rod of iron: and he treadeth the winepress of the fierceness and wrath of Almighty God. And he hath on his vesture and on his thigh a name written, KING OF KINGS, AND LORD OF LORDS (R 19).

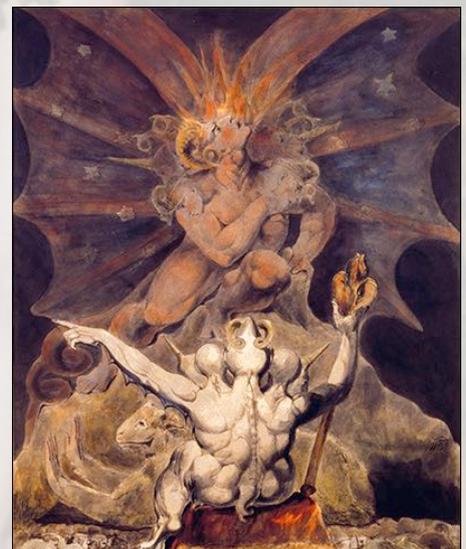

The final Judgment takes place, referring to the book of life shared by many traditions:

And I saw a great white throne, and him that sat on it, from whose face the earth and the heaven fled away; and there was found no place for them. And I saw the dead, small and great, stand before God; and the books were opened: and another book was opened, which is the book of life: and the dead were judged out of those things which were written in the books, according to their works. And the sea gave up the dead which were in it; and death and hell delivered up the dead which were in them: and they were judged every man according to their works. And death and hell were cast into the lake of fire. This is the second death. And whosoever was not found written in the book of life was cast into the lake of fire. (R 20)

Fig 150i: "The number of the beast is 666" William Blake.

All ultimately culminating in the complete destruction of both Heaven and the "late planet" Earth, in favour of a heavenly Jerusalem:

And I saw a new heaven and a new earth: for the first heaven and the first earth were passed away; and there was no more sea. And I John saw the holy city, new Jerusalem, coming down from God out of heaven, prepared as a bride adorned for her husband (R 21).

This itself is a travesty of the Song of Songs, which became in the Hebrew tradition, due to Rabbi Akiva the allegory of YHVH and the Bride Israel, then converted by Pauline Christianity into Christ the Bridegroom and the Church, all of which are a travesty of the ancient Hieros Gamos of sexual fertility.

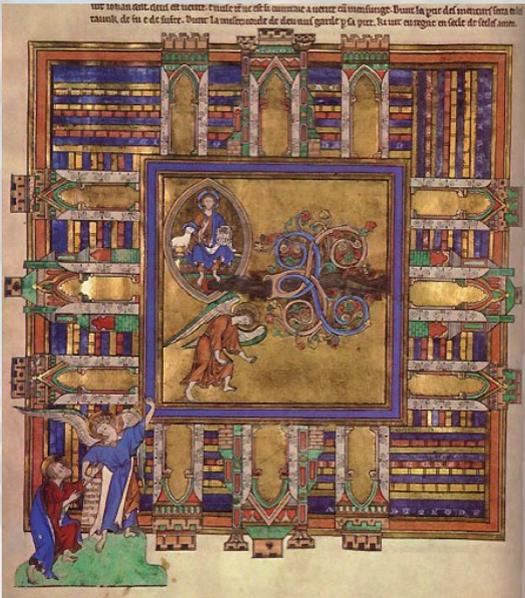

Fig 150j): The Tree of Life in the new Jerusalem with the twelve gates, the throne of the lamb, and the twelve monthly fruit for the healing of the nations conflating the transcendent and the physical into a contradictory fantasy (Heavenly Jerusalem from Apocalypse 13th cent).

There follows no renewed biosphere but just scintillating urbanisation in the form of a heavenly city of Jerusalem. The only remaining evidence of the arboreal verdancy of biodiverse Paradise is a lone tree in the midst of the heavenly city, bearing fruits for the healing of the nations of humanity:

And he shewed me a pure river of water of life, clear as crystal, proceeding out of the throne of God and of the Lamb. In the midst of the street of it, and on either side of the river, was there the tree of life, which bare twelve manner of fruits, and yielded her fruit every month: and the leaves of the tree were for the healing of the nations (R 22).

Thus by implication and scriptural neglect, nature and the biosphere is consigned to the flames of warfare of “good” in the persona of Christ as an avenging “Lord” on a horse against all the

forces of other beliefs such as Ishtar, and the dark fallen angel of Satan, or Iblis or the Beast whose number is 666 χξς in Greek, although in Islam it is 616. The sheer scriptural neglect of nature is starkly highlighted by the failure of John of Patmos to mention what has happened to the diversity of life, mentioning “creature” only once for those in the ocean, and animals not at all except for the locusts of Hell, themselves not natural organisms, the domesticated horses of the apocalypse and the white steed of Christ.

It is clear that the source of an eternal concept of evil in opposition to good arises from religion itself, not nature, or humanity as such. The Origin of Satan, Elaine Pagels (1995) describes the social history, of a multifaceted adversary, running from the Hebrew notion of an angelic messenger of God sent to test and impede, to the War Scroll's dark angel Mastema, created for the pit who rules in darkness, whose purpose is to bring about evil and sin. These accounts make clear how the concept of a war between good and evil is a dark creative product of the religious imagination. Revelation notes a past war in heaven in which Satan was cast into the world that tells of a fundamental schism within divinity itself, into dual polarities of dark and light:

And there was war in heaven: Michael and his angels fought against the dragon; and the dragon fought and his angels, And prevailed not; neither was their place found any more in heaven. And the great dragon was cast out, that old serpent, called the Devil, and Satan, which deceiveth the whole world: he was cast out into the earth, and his angels were cast out with him (R 12).

References to the Day of Judgment in Islam, likewise feature cosmological cataclysm, and death and resurrection of all, with the Muslims succumbing to a cool wind, avoiding the horrors of impending death and destruction of the Earth:

*When is the day of resurrection? So when the sight becomes dazed,
And the moon becomes dark, And the sun and the moon are brought together,
Man shall say on that day: Whither to fly to? By no means! there shall be no
place of refuge! With your Lord alone shall on that day be the place of rest
(Quran 75:6).*

*When the trumpet is blown with a single blast and the earth and the
mountains are lifted up and crushed with a single blow,
then, on that day, the terror shall come to pass, and heaven shall be split
(9:13–16).*

*When the sun shall be darkened, When the stars shall be thrown down
When the seas shall be set boiling, When the souls shall be coupled, ...
When the scrolls shall be unrolled, When heavens shall be stripped off,
When Hell shall be set blazing, When Paradise shall be brought nigh
Then shall a soul know what it has produced (81:1,2,6,7,10-14).*

Fig 150k): War in Heaven. Inset of The Haywain Triptych Hieronymus Bosch

The resurrection then leads to the judgment:

*As for the one who is given his book in his right hand, he will say:
Take and read my book. I knew that I would be called to account.
And he will be in a blissful condition (Q.69:19–21)*

*But as for him who is given his book in his left hand, he will say:
Would that my book had not been given to me
and that I did not know my reckoning! (Q.69:25-26) ...*

Seize him and bind him and expose him to the burning Fire!(Q.69:30-31

But Islamic Heaven rather than the Heavenly city is a cultivated Edenic garden paradise, with fountains and plants but nothing like the wilderness of natural living diversity. The Quran suggests there are grapevines, date-palms and pomegranate trees in Paradise, and many others, but these are cultivated fruit-bearing plants that lack thorns:

There will be a success [Paradise], gardens and grape yards [78:31-32] In them [both will be fruits, date palms and pomegranates [55:68]. In them be every kind of fruit in pairs" [55:52] Among thornless lote-trees, among Talh trees with fruits piled one above another, In shade long-extended, By water flowing constantly, And fruit in plenty [56:27-32] Reclining upon the couches lined with silk brocade, and the fruits of the two Gardens will be near at hand [55:54].

Fig 150l: A Mindanaoan Muslim Buraq.

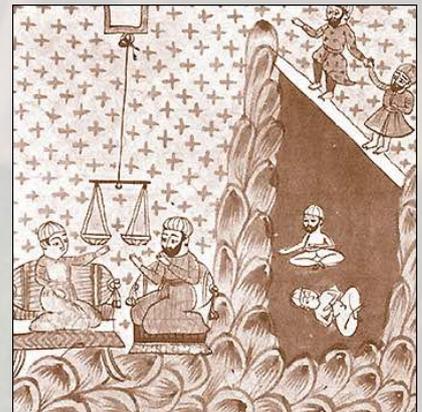

A scattering of real and fictional animals such as the winged Buraq (that figured in the journey from Mecca to Jerusalem and up through the heavens and back by night) and the hoopoe hat brought new to Solomon about Bilquis the Queen of Sheba, are also mentioned in the Quran in Paradise. In terms of their place in the earthly hierarchy, animals are mentioned with humans and jinn. On the day of reckoning, all creatures will rise up and have justice for any wrong that was done to them, including animals.

However, only humans and jinn will be judged on their actions and go on to the afterlife. Animals are viewed as creatures that are deemed to be in a state of constant worship and do not have free will. Like cultural laws of judgment, this concept is not divine, but a product of language and culture and the knowledgeable ability of humans to choose to transgress culturally ordained doctrine, which other animals do not, despite being subjectively conscious intentional sentient beings, just as we are.

Ideas of the afterlife evolved through cultural and religious interaction, from a common place of the dead into binary visions of good and evil – Heaven and Hell. The original Hebrew view of the afterlife was Sheol שְׁאוֹל an underworld place of darkness and gloom, the great rendezvous of all the tribes and families, where all the dead lay, sharing features of Greek Hades and the Babylonian Arallû, which gradually evolved into separate compartments for the good and bad (Pearson 1938) . In the time of the Kings, Gehenna became a hell, in which the wicked were tormented with fire, named after Gehinnom גֵּי הִינּוֹם the valley surrounding old Jerusalem and the site of the Tophet תּוֹפֵת, where some kings of Judah were believed to have sacrificed their children by fire. It is noted in the Talmud as a place of purification, rather than eternal damnation, after which one is released from further torture.

The end of days notion of a Day of Judgment involving the alternate fates of Heaven and Hell was first pictured by Zoroaster as the cleansing fire of Ahura Mazda burning out the ignorance of Angra Mainyu in our first full model of the nature-violating hell fire and damnation later pictured in apocalyptic scenarios, from Revelation to the Quran. The paradise of Zoroastrianism is attained the fourth day after death by crossing the Bridge of the Separator, which widens when the righteous approach it. The righteous soul crosses the bridge and is met by a beautiful maiden who is the physical and feminine embodiment of all his good works on Earth. He is then escorted into the House of Song to await the Last Day.

Fig 150m: Zoroastrian Chinvat Bridge and the Judgment. Yazidism, a religion having roots in Iranic pre-Zoroastrian religion whose population Islamic state attempted to commit genocide upon, also cites an actual Silat bridge in Lalish that leads to the most holy Yazidi shrine. It symbolizes the connection and crossing over from the profane earthly world to the sacred, esoteric world. As in Zoroastrianism, the Silat Bridge in will also play a role at the end of times in Yazidism (Kreyenbroek 2005 39).

On this day, everyone will be purified and live in a new world absent of evil and full of youthful rejoicing. But for the less than righteous, the bridge turns on its side and becomes like a razor. The god Mithra is there with a scale to balance the good and evil deeds done during one's lifetime, and if evil deeds prevail, then the soul is tormented by an old hag before it falls off the bridge into a hell of purification worse than Dante's inferno, portrayed in the Vision of Arda Viraf.

Islamic traditions share the concept of Hell (Jahannam) with its seven enclosing gates, the record of deeds, the weighing of the soul, and the test-bridge, which widens for the righteous but narrows to a knife-edge for sinners so they all in the fire. al-Llah (in his mercy) reserves the power to save those whom he wills and to look favourably upon those for whom Muhammad intercedes. He has fixed a limit to the suffering of believers who have sinned either through past human ill deeds, by acts or the emotional afflictions caused and vice versa. However, for unbelievers, who refuse to acknowledge their Creator, there is no hope of final redemption from the fire.

However note carefully that, like the Jewish view, the Zoroastrian hell was only a temporary state before one became purified and entered the paradisiacal realm, so although the fires of purification were gruesome in the extreme, the idea of eternal damnation is a perversion of the entire purification concept. Like Upanishadic and Buddhist traditions, Zoroastrianism seeks integration of the psyche through purification of faults, not eternal damnation.

Reincarnation is the evolutionarily-preposterous idea that the souls of humans and animals as well are reincarnated intact in another sentient being – in metempsychosis – the transmigration of the soul. In Buddhism it is the ego grasping at life which causes reincarnation, rather than the soul or self (atman). This means the progression of the psyche, supposedly towards enlightenment, is in root conflict with the natural diversity of life, and its biological evolution as we now know it to be 2,500 years later. Reincarnation cosmology is a mistaken consequence of the difficulty of achieving true enlightenment and is as inconsistent with both empirical biology and natural evolution, as is creationism and its offspring intelligent design.

There are four factors predisposing to negative karma: (1) very few people gain enlightenment in a given lifetime, (2) religion laments endless ego suffering, (3) humanity is threatening its own survival through our selfishness and exploitation of nature and (4) Vedic religions invoke the cumulative descent into the Kali Yuga, or Samvartakalpa. This gives karma a negative entropic influence, weighing down an organism's capacity to survive due to negative factors, both in their inner constitutions and environmental circumstances. This becomes a tragic error of conception that raises a huge question over the permanence of the eternal soul in all religious traditions. Of course you might consider that the plants are giving us such good karma for keeping us alive using solar radiation, but being reborn as a plant? Here the sublime becomes the ridiculous.

Fig 150n: The Cycle of Birth and Death – Jadurani Dasi
Human and human-animal reincarnation.

The very notion of karma as an actual reality would thus place a huge moral drag on the evolutionary process, because an organism becomes unable to optimally adapt to and survive in the existing environment due to causal competition by past karmic factors putting a brake on reproductive and survival strategies, mutation and natural selection. It is also misappropriating nature as the generator of conscious life in favour of spiritual elitism over life itself.

It is particularly easy to see how Eastern religions, in which cosmic consciousness is perceived as transcendent over material nature, will perceive

the soul, as the conscious continuum dominant over the natural living body. But the view is also shared by Orphic religion and Platonic philosophy, so it pervades Western thought as well, an idea also shared by Nietzsche, Schopenhauer and Kurt Gödel. Such transformations have an ancient heritage in animism, where everything is alive

and human and animal identities are frequently exchanged. Many of the San trickster heroes such as Kaggen are thieranthropes that physically transform between human and animal.

Consequently, because of the continuity of rebirth and the intactness of the soul, there is no barrier to humans being reincarnated as animals and vice versa. Moreover your supposed identity is just a shell an exchangeable garment, so you are not even a human but just an eternal avatar, or in Buddhism a recycling ego grasping at life. A human who is lazy may be born as a sloth but the unique features of their soul remain latent until a later lifetime:

Reincarnation is a theory central to the religious practice or spiritual beliefs of millions around the world. We often hear stories of people remembering their past lives, but usually they tell of previous lives as humans. In some cases however, there are instances in which a person remembers stories of their past life as animal. When we realise that we have been born countless times, in various human and non-human forms we can begin to develop compassion within our minds and appreciate all forms of life to a greater degree. This leads to a harmonious relationship with various sentient beings, and the environment in which we all live (Tsem Rinpoche).

Reincarnation between humans and animals is thus not just confined to Eastern religions such as Vedanta, Buddhism and Jainism, but was shared by ancient Greeks including Pythagoras, Empedocles, and Plato. In “Dumb Beasts and Dead Philosophers” Catherine Osborne (2007 43-62) explores how moral claims can become counted as true, and how they can be discovered or acquired. Was Aristotle right to see continuity in the psychological functions of animal and human souls? The question cannot be settled without taking a moral stance:

Souls of individuals circulate (or transmigrate) from body to body, and can reappear in the bodies of other creatures. Since the soul remains the same (the same individual) from one life to the next, this has the consequence that the soul of animal x (say, my current dog) is the same individual soul as the soul of human being y (say, my deceased grandfather, or William Shakespeare). So long as there are no constraints on who can become what, it seems that we can then generalize and say that all dog souls are potentially human souls, and so are all worm souls, all frog souls, and all wasp souls. It is not just the ugly toad that might be your handsome prince in disguise. ... A Pythagorean could consistently maintain that the soul is essentially the same soul, retaining all the fully developed human capacities, even though in its present condition, reincarnated as, say, a worm or a bird, it is unable to display the latent characteristics it possesses. And it follows that to claim that the similarity between species lies in the soul rather than the body allows for a far more radical identity between human and animal souls, a similarity that is not conned to minimal stimulus response or pain sensation of the sort often invoked in modern attempts to include the beasts in the same moral sphere as human beings.

But this idea is completely at odds with the principles of biological evolution and physical cosmology itself, where it subsumes the act of birth, impeding new innovation, just as creationism does. It leads to counterfactual conclusions about the population of sentient beings in the universe. What IS a sentient being? Where does a colony of cells end and an organism begin? It would have disastrous consequences if it were true. The entire conservatism of species evolution based on our genomes depends on dogs giving birth to dogs, perhaps with a few tiny mutations, not sharks, humans or worms. The number of insects on earth vastly outnumber the mammals. The number of bacteria are inestimable. There are no reasonable boundaries where such a process would begin. If worms, why not amoebae, bacteria, or viruses, or even molecules? It is clear that reincarnation is a morally invoked philosophy that files in the face of all observational empirical evidence, based on treating sentient beings as simply conscious entities having no grounding in biological or genetic identity.

It is a condescending insult to the sanctity of biological life for human religious and cultural traditions to impose a false moral cosmology that treats animals as inferior karmic conditions of existence, with the same intrinsic flaws as Monotheistic dominion over nature, by divinely ordained human beings. Such beliefs are utterly damaging to the integrity of the biosphere and the key role it plays in ensuring human survival.

(9) Naturality versus Spirituality

Jesus said, "If those who lead you say to you, 'See, the kingdom is in the sky,' then the birds of the sky will precede you. If they say to you, 'It is in the sea,' then the fish will precede you. Rather, the kingdom is inside of you, and it is outside of you. When you come to know yourselves, then you will become known, and you will realize that it is you who are the sons of the living father. (Gosp. Thomas 3)

'His disciples said to him, "When will the kingdom come?" Jesus said, "It will not come by waiting for it. It will not be a matter of saying 'here it is' or 'there it is'. Rather, the kingdom of the father is spread out upon the earth, and men do not see it.'" (Gosp. of Thomas (113)

Taken in the context of Symbiotic Existential Cosmology, Jesus is saying:

(a) (i) life is enlightened in all the species and their symbiotic biospheric niches, (ii) existence is both subjectively conscious and physically real and (iii) it is we who are the enlightened ones too if we just come know ourselves and

(b) the physical reality is the enlightened paradisiacal kingdom lying before us, not an illusory heaven.

It's to do with integrating conscious experience and the natural world, not a transcendent spiritual realm. This is the opposite of Vedanta because it recognises the species are distinct, not just conscious sentient beings. Even the Upanishad of the Great Forest just uses nature as a backdrop for samadhi. I don't accept the "Father" notion, but the crux is that natural existence and the diversity of life comes first – **primero uno – prima facie** – not a human renunciation tower of elite inner mental states like zeno's paradox, heading to turtles all the way up, as Vedanta does.

I am forced to preach this, like I'm standing on the last shore of Earth which is where I precisely am in the antipodes, because no one in this techno-industrial world of AI thinking is even remotely concerned about dumb animals or biodiversity preservation and would just as rather have a neural networked cartoon reality than protecting life itself.

John Kineman: I think I hear what you are concerned about - a natural spirituality where there is, aside from all our striving, nothing more to gain than a genuine and aware life as a full experience itself, without the need or possibility of a "better place" in heaven. That better place is right here with better understanding, is that a fair summary?

Your reply was only about the human quest and natural existence in the living universe as opposed to imaginary religious heavens and eternal life, but the preservation of life and other living beings appears to have become absent entirely. I don't see how ethics can have any meaning unless we can be awash in the flux of life and feel what we are doing for life as a whole is right for life as a whole. That's enlightenment in action, not a paradise just for ourselves as some begrudging acceptance of physical reality, still adhering to human supremacy in dominion over nature.

Note that I said life is already enlightened in all the species and their symbiotic biospheric niches. That brought me back to what distinguishes human cultural "intelligence" from conscious life as a whole. All mammal brains have evolved to deal with irreducible uncertainty in survival in their environmental existential crisis state. The only species that is not in its biospheric niche is humanity, because our niche has undergone such excessive reconstruction that we have become technological culture. Now there's a reason for this. The bodies of every other species are streamlined ecologically, to be fit for purpose, so dolphins, no matter how smart, have only fins and their culture is sexual and their actions apex predatory swimmers. Elephants have no fingers just stout stump feet and have a super proboscis but it can't write or use a laptop. All apex predators are phenotypically streamlined for purpose and the herbivores too.

So the overwhelming conclusion is that primates have two unique evolutionary inventions as I have mentioned. **Firstly** fingers and opposable thumbs and **secondly** referential alarm calls that are species and context specific and need to be vocalised accurately. Human culture arose from these two unique adaptations that go all the way back to the lemurs, but humans are the only large ape species that have retained finely tuned vocalisations. Existence is universally semantic. A mother puma teaches her young by semantic example hunting while they watch. All mammals and smart birds have this generalised semantic sense and finely tuned vocalisation is an intrinsically semantic affair as Vervet monkeys demonstrate, while the other great apes can mount only rough grunts and chutzpah cries.

So what we have become is a product of runaway memetic cultural feedback results of these two bodily attributes that are not a product of superior human intelligence but the reverse they caused it – human cultural intelligence is a peacock's tail red queen race between culture and nature as a result of fiddling fingers and referential alarm calls forming a gigantic resonating memetic feedback process that became human social culture and then, from the poison arrow head and the wheel, to chemical and industrial technology and then the internet and AI. We are the victims of a reverberating echo chamber of viral memetic culture, so now we are surrounded by machines rather than living organisms and are trying to recreate the spiritual One to unite us all to find our way back to Eden, while our culture is biospherically unsustainable, propagating itself in pastimes from the wild animal markets and bushmeat trade, to mutually assured nuclear destruction and climate and habitat crisis. This is a Fermi catastrophe death wish.

Thus there is no excuse for calling any well-adapted mammal or bird a dumb animal, lesser than elite human culture. A mouse has as good a cortical neuronal count ratio to its whole brain neuronal count as a human and a far higher cortical neuronal count to brain volume, despite its smooth cortex, so it is in principle as intelligent as a human except for overall size, but then it has eight times as many pyramidal cells in the same volume of tissue. Birds like parrots and song birds have about a five-fold higher pallium neuronal count for size than equivalent mammals including humans.

We see these animals as dumb because they don't have a cultural language like us, but that's because they are highly adapted to their biospheric niche. There is no point to ethics or morality, if it is just a recipe for human species elitism even if it feels okay and certainly not if it is based on rational thought alone.

Now what's the acid test of all this? A thing I think is key is that the emphasis in both Vedanta and all religio-spiritual accounts in the "scriptures" including Monotheism aren't reality itself, but just a cultural description of what men have thought might be "reality". You may choose to extol them as higher knowledge, or the wisdom of the saints and sages, but they are not natural accounts, or accounts of untrammelled nature, but accounts of the disconnected human psyche caught up in the feedback loop of cultural reification, perceiving deep spiritual reality in elite human conscious states extrapolated onto the universe as a whole, as God and cosmic consciousness. But you can't substitute the description of reality, which may seem to be essential wisdom, for reality itself.

No greater illusion can you have than thinking the Vedas are an ultimate source of reality, when we know they are above all a cultural description, not reality itself. They are no closer to reality than a physicalist description of neural network activity is. By reading them as trusted sources of wisdom and insight, we are simply confessing to our inability to submerge ourselves in the deep wilderness and know ourselves as the cosmos knows us. This is simply applying the acid test of true naturalness. Anything that we can primarily identify as cultural is part of our cultural peacock's tail. We can't assume scriptures are trusted sources, or the true intimations of divinity, because they are deeply biased by the shimmering tail of culture. Elite spirituality is thus intrinsically flawed and obviously so. Before we can understand any of the superficial descriptions of reality, like the scriptures, we need to plunge ourselves deeply into the wilderness of conscious experience beyond all towns and countries, not clutch at the straws of wisdom in the literature for want of personal knowing. Only then can we come back and reappraise the scriptures and see them as they are with their own unique mix of the knowledge of other peoples' experiential journeys of discovery and know how near or far they actually are from the natural condition that is emergent from the cosmos itself and is ultimate reality in the raw.

This applies to all utopian visions, from the noosphere, which lays claim to a spiritual ascendancy of thought over nature and life itself, to all technological utopias, in which artificial or hybrid intelligence is conceived as the future of cosmic intelligence and the foundation of existence. If any such notion invokes deprecation of the evolving biological biosphere and is founded on cultural notions per se it needs to be assessed accurately for what it is and found wanting from the wilderness perspective. We can't even begin this quest unless we submerge ourselves so deeply in the flow that we are totally and completely engulfed.

The first and hardest acid test is simply to rescue biodiversity back from the brink of mass extinction. That's the ethic of conscious survival. It's not altruistic, it's mutual and it's necessary. I don't see we have any kind of "optional" cultural ethics about this. This is the problem of "the Kingdom lies before us but men do not see it" in full cultural technicolour.

John: I don't see how bio-naturalism in SEC addresses the influence of consciousness on nature or its role in nature.

Chris: Nature is consciousness incarnate in living diversity. What you call "bio-naturalism" is the responsibility to life we inherit by realising this. We cannot be enlightened unless we take full personal responsibility as the conscious sentient guardians of life for who and what we are as a species, because otherwise we are psychopaths and our culture will self-destruct. Life has risen to climax in biospheric symbiosis, in which diversity is the key to fertile fecundity. We emerged in a biosphere where life thrived because animals were eating plants and carnivores were eating herbivores and diseases were raging when species over-reproduced. Without the diversity that arises from evolution at the edge of chaos, humanity would never have evolved. So for every second of this incarnate existence we need to protect, not just conscious life, but the genetic and phenotypic diversity that preserves it in future.

Subjectivity is coeval with the cosmic origin so may manifest in natural phenomena like storms and all life. How can we tell a hurricane is not subjectively aware since we can't even experience one another's private conscious experiences? But full sentient consciousness as we know it emerged in the eucaryote endosymbiosis, which is the second great becoming after the origin of life itself, when the cell membrane became freed for sentient edge of chaos excitability. Life is not just a molecular accident that made RNA and organismic "robots". The symmetry-broken forces of nature are the mandala that is the true Veda. Physics is the sacred law that shows us in biology how we consciously arose and what our ultimate role and responsibilities to life as a whole are in the universe. This is the full cosmic Mahayana, not the spiritual hinayana. Full consciousness is a living property of eucaryote cells that rises to conscious sentience in us through intimate social coupling of neurons and neuroglia as resonating social cellular systems a billion years later. The

way molecular biogenesis and living evolution work is as a fractal climax of the four forces of nature interactively rising to consummation. It is the climax and pinnacle of natural cosmology and life is the holy grail of consciousness, so that the entire universe can become aware and know itself as we also are known of ourselves.

We do have an existential role and that is to protect the living diversity of life as a whole. It's not ethics, it's the joyous cosmology of existence. Until I can say *prima facie* and get a cognisant response, we are still at ground zero from here to there. That's why I said I was standing a lone voice on the last shore of Earth!

John: So, you are saying the highest ethic is diversity. Indeed ecologists have made this argument, but it is hard to support in any absolute sense, i.e., as the primary value. Diversity has increased and decreased without human involvement. There is probably a floating optimum diversity for some arbitrary measure of biosphere function at any given state of the biosphere, but not a general goal of increasing, decreasing, or stable diversity. The idea of diversity as a universal, "*prima facie*" value of life was popular in the 70's but that turns out to be relative along with every other natural value. The thing is humans are doing the valuation -- nature seems happy with whatever state it is in and any status has multiple possible futures. The core ideas in the Vedas and Upanishads are looking for the deepest principles having discovered that all values based on form are relative. Thus Maya. Going beyond any measure of good or bad state or form, Veda concludes that the main principle in material existence must be cycles.

Chris: Nature is not "happy" in the state it is currently in, of an impending human caused mass extinction, already causing acute stresses. I'm not supporting diversity in an absolute sense, but as a core cosmological process becoming our realisation. Yes biodiversity is neither constant nor is it a simple rising exponential like the human delusion of the GNP. But all the previous serious reductions in diversity were astronomical or tectonic mass extinctions. They weren't because life was "happy" to suffer a mass extinction. Individual organisms are simply striving to reproduce and care for their young in an uncertain perilous world. You can't turn a blind eye to the sixth mass extinction by humanity, by claiming *samadhi* shows everything is relative (*maya*) and that things just go up and down karmically in cycles.

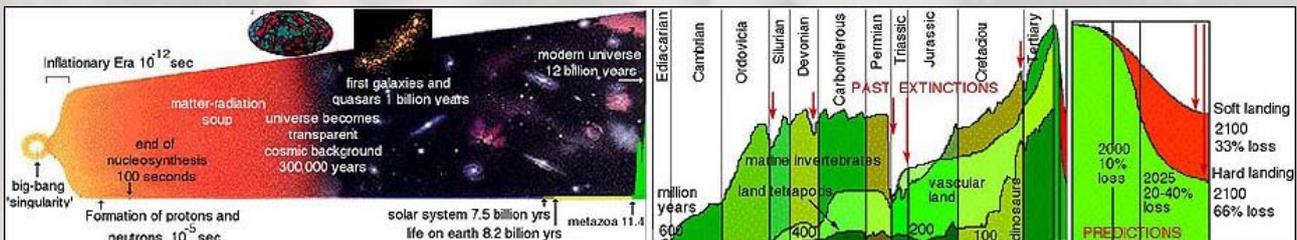

Fig 150o: The solar system formed 4.57 bya ago and Life on Earth has existed for 3.5 bya, but the chemical elements required multiple previous supernovae go back some 10 bya in a universe of some 13.5 bya. There have been five catastrophic mass extinctions due to astronomical and tectonic crises which take millions of years to recover from. A sixth is happening as we speak.

Saying as an elite human ecologist that life doesn't care if it lives or dies is expedient negligence. You know that life on Earth has taken a good quarter of the universe's lifetime and had to be preceded by multiple supernova events to generate the atomic diversity of the Oort Cloud, going back some 8-10 bya in all. Every significant decline is a mass extinction and we are already committing an awful near-Fermi extinction as we speak. To say nature seems happy with whatever state it is in is elite cultural condescension. How is nature supposed to respond? Tell that to a mother lioness who is trying to teach her cubs to hunt and not starve! Are the lions supposed to weep and gnash their teeth? You know the answer in full crisis. The weeds, rodents and parasitic fungi take over and the biosphere darkens and makes fragile human culture unliveable. But you are pretending that climax diversity in paradise on the cosmic equator is not even a cosmological reality, so you need to refresh your cosmological world view in the fractal biogenesis in [figure 1](#). Yes it transcends all the pretensions of spiritual ethics just as the edge of chaos transcends the universal good.

John: Your description of *edge of chaos* in mathematics and neuroscience gives me some clues to your view. But the ontology is still very weak. Chaos, like all other metrics, are descriptions or models, and as such they will never measure experience itself. Only a meta-level can describe it, but still not have it. So my question is why the metrical view of chaos should be thought to tell us anything at all about ethical and moral dimensions.

Chris: It's not the metrical view of chaos at issue, its the edge of chaos as a cosmological principle and it's a definitive counter-example to the ethical and moral delusion of a benign rule of order in Vedantic and religious belief and it IS cosmic-ontology: **Being exists at the edge of chaos**, not in a hypothetical regime of benign or imposed spiritual order.

It's manifested in cosmic inflation as the source of symmetry-breaking into an expanding universe, in the cosmic web, in galactic gas clouds and astronomical collisions, the molecular dance of biogenesis as a far from equilibrium dissipative system dependent on chemical gradients and solar radiation, permeates mutational evolution, again dependent of free energy through fermentation, respiration and photosynthesis, and is the crest of neurodynamic consciousness in environmental and existential uncertainty. The **ontology of being arises from the edge of chaos**. Order is by its dynamic nature tyrannical and leads to stasis and extinction – even cyclical regimes of order have annihilating attractors. The remaining asteroids have chaotic orbits lacking resonances with those of the other planets, because those that did have periodic mode-locking all suffered astronomical collisions. Yes the edge of chaos is a description of reality, but so is science and the Vedas and all scripture too. We need to learn from and respect the edge of chaos cosmology of life, not assert a priori that the Vedas say it all comes around in oppressive cycles of divine order, any more than the stark division into heaven and hell of Monotheism.

The forces of nature predispose the universe to interactive climax through their non-linear charge dynamics just like the non-linear simple deterministic examples of the Lorenz flow, resulting in the butterfly effect, but in a hugely more overwhelming quantum molecular process. Biogenesis happens as a far from equilibrium dissipative system and all life flows from it on the same basis. We are “negentropic” organisms by virtue of free energy sources. We don't and can't impose order on the chaotic entropic universe, because it's cutting off the hand that feeds us life. We have to accept that all life's processes are dissipative edge of chaos phenomena and that's how life and conscious life can come into being and continue to exist. Hence pure spirituality seeking the rule of order is hubris.

We can imagine that human activity is a force for order, making controllable technology and industry that seems to tame the wilderness, but it's all hubris of the most foolish kind. If we take the entire flux of assumed order-inducing human activities on the planet, including industrial manufacture and the silicon revolution, they are completely offset by a huge increase in entropy from fossil fuel burning that cannot be sustained. Even solar and wind technology are simply robbing the biosphere directly or indirectly of its radiant energy sources which matters less but is still a rort. So the whole delusion is a house of cards and it certainly doesn't establish an example of order constraining the laws of nature.

Life is a non-equilibrium quantum molecular dynamical system at the edge of chaos. The plants are complex far from equilibrium living “solar panels” generating glucose, so they grow in fractal scale, but they don't impose order on chaos. All animal species act to reduce order, either by eating plants, or other animals. Fungi stand in the middle, coopting parasitic and saprophytic roles. Bacteria, archaea and protista likewise. Nowhere do you find any meta-causalities imposing order on an otherwise chaotic universe. Life works within and with the existential milieu. There is some sense in the notion of autopoiesis as an abstraction of homeostasis that describes how the organism evades death and entropic decay teleologically, so you can elucidate the ways in which life accrues entropy reduction from free energy to enable organismic survival. But none of it is order imposed on chaos.

If you look at the information content of the human genome of 3×10^9 base pairs, it is a vanishing fraction of the complexity of the 10^{10} neurons with 10^{15} synaptic connections. Embryogenesis from the zygote to the organism is an exercise in utilising edge of chaos to bootstrap the fractal complexity of the human organism. You can trace this in some detail but a lot of it remains mysterious because it uses all the principles of symmetry-breaking that the standard model of physics can induce, from the two-cell stage on. It's a fallacy to imagine that genetic coding specifies brain structure. What we know is that waves of cellular migration by neurotransmitter type pass through the cortex each giving rise to successive symmetry-breaking that organises the five to six layers of the cortex by some 100 neuronal types. Many of these, like the 5HT1a neurons, still play a key role in cortical activation and inhibition of consciousness. The process completes before birth in chaotic neurodynamic excitations, working from the sensory organs, backwards through the thalamic ganglia to the cortex, that enable the networks to develop a sense of “community” functionality.

So I'm trying patiently and gently to nudge you all to completely let go of your delusions of spirituality as ultimate transcendent order because it is unsustainable in the universe in which we consciously exist and a deleterious soft-sell for doctrinal oppression at the next stage.

Yesterday I picked up the 2022 edition of Patrick McNamara's “Cognitive Neuroscience of Religious Experience”. What is signal about this is that he is a staunch supporter of religion in the brain and has previously been disparaging about psychedelic mystical experiences. Suddenly this edition has a full chapter on psychedelics which is an excellent

overview ending focusing on psychedelic "entity" experiences, which may be sourced in him having had a DMT experience. These entities are in many forms the equivalent of my meeting with Brahman that evoked SEC as an inspirational response. Now what is pivotal is that I experienced Brahman both as ultimate reality and as an Ishvara-like semi-divine entity. Claiming Nirguna Brahman is the featureless source and Saguna is the manifest secondary aspect, is fundamentalistic twaddle. The vision is just a divine vision and that's it. It is corrupt and wrong of the rishis to have a samadhi where at great effort, they touch the edge of this overwhelming phenomenon and then claim the universe is made by cosmic consciousness, or that moral karma pervades the universe, or that divine order rules, or that it will all end in annihilation until the new cycle in a universe doomed to spiritual groundhog day.

The reality is we are and have become through our biospheric dominance, the cosmological guardians of the generations of life who have lost our way in religious fixation and spiritual and utopian capitalistic laissez-faire pretensions. We need to (1) experience each vision with no presumptions and (2) save the future diversity of life from our own destruction so that future generations can know and experience this ultimate joyous cosmology unfolding.

John: Writing this response was difficult. It is a very complex issue and treacherous territory. You should know first that I am a strong conservationist, even having risked my life in Africa in active wildlife protection and conservation efforts. I support a Gaia worldview and advocate for animal rights, having had a number of conversations with Jane Goodall and Mark Beckoff. We are indeed in the 6th and most rapid mass extinction event in known history of the Earth.

The total numbers nearing 40-50% species loss have not yet exceeded prior natural extinctions, but the rate of loss is much greater than previous extinction events, and projections are clearly dire. This is the first unnatural extinction event, caused by human activity. So, again, in technical terms, nature has seen it before, but we haven't as a global society. Globally, 50% of the usable land has been converted to human use. We've doubled fixed nitrogen inputs exceeding natural use capacity and creating dead zones. We've doubled CO2 inputs creating a climate crisis and global range shifts that affect all natural populations as well as agriculture - our own food supply. So we do now have controlling interest of the Earth Corporation. The Wild Foundation has a program advocating for "Nature Needs Half", since most measures of human dominance (biodiversity loss, land use conversion, CO2 inputs, fixed nitrogen inputs, etc.) have us on a 50:50 par with nature.

Even ecologists don't have a simple answer, although many think they do. The Vedic / Deep Ecology view is that there really isn't a line between human and natural, thus we have to manage both by the same principles, derived from a deep introspection of who we are first, and therefore projecting that backwards into evolution to understand what nature is. That is not an anthropomorphic exercise, it is being informed by the unique view we have into the Self that each living creature has of its own. It is our only way of studying and understanding that aspect of existence. So, I think my initial reaction was that these things are not about what nature wants, they are about what we should want. It has to be linked to human values both to recognize the problem and to find the solution, because other measures are inadequate and can be ignored. I think to be an advocate of living nature we need to work on the human mind to correct our perceived separation from nature. Nature will find a balance with human activity. It's the human species that isn't behaving adaptively. So let's learn from nature.

I also believe in spiritual values that emerge in natural life, populations, and ecosystems. Each natural system has an essence that can be felt; what I would say is a sacredness that emerges from complex system qualities, not numbers. I think it emerges mainly with time that a system has had to develop complex internal relations, for example, an old growth forest. There was one in Hawaii I used to stop at returning from work. I could get a sense of eternity instantly there - it was palpable. Spirituality is always associated with a sense of the eternal, and that's what emerges when nature is allowed to evolve its complexity. What is spiritual and what is worldly? Spiritual is called "real" by some, but what is meant is eternal. The world is temporal. I also think other creatures sense this internal difference as part of their identity, as we do but certainly differently. I think all creatures have some sense of the eternal, that it even figures in their health and prosperity. Just because it is more-so with us doesn't mean we can deny it for other species. So I think that is the aspect we need to respect and protect. The other measures will follow. Maybe the Jains go too far, but they make a point. Still, this sense of the eternal, the divine; it is transcendent. The material presence of life probably builds toward manifestation of eternal qualities if not disturbed. But along the way it endures all manner of setbacks and change, affording no material outcome as a reliable indicator of health and wellbeing except to let it take

a natural course. The thing is we can't let nature take a natural course unless we do also — we're too involved. I think we have to re-learn from nature what it means to be fully human. The needed study is of the human condition.

Chris: That's a great account of the dilemma of the biosphere and I agree with you in all the intricate details of the problem and of course I agree wholeheartedly with you in your closing statement. So let's move on to deal with what it means to be fully human. Some of this I have covered before but I am setting it into the record now, because in writing it as a coherent biodiversity record, I discovered several things about it that explain karmic events including how biospheric jihad arose through the AP article below.

First before engaging the treacherous territory of biodiversity conservation, let me engage with what I would call **naturalistic spirituality** which I hold to be the **true spirituality** of living existence, not contrived by Vedic scripture or intimations of omniscient and omnipotent godly rule, not cultural morality designed to control human folly, but immanent and transcendent nature. I critique only **pure spirituality** as an anthropomorphic cultural delusion of human ascendance over nature, **not spirituality itself**.

We take a step back to the late 1980s, when I was doing mushrooms in the Opuhi meeting house. This is a wild and beautiful wilderness peninsula we bought together, but NZ is a nation-wide problem for all native species because Aotearoa was even more isolated than Madagascar and Australia and had only lizards and birds and a great eagle as apex predator, the largest raptor on Earth, that the Maoris killed off early on. Consequently every feral animal, including stoats, possums, rats, cats and dogs can wipe out our native birds, particularly our most iconic species the kiwi, which is a voracious feeder with a long neck and bill. In addition, NZ is one of the most farmed lands on Earth, so the North Island has lost the vast majority of its great Kauri forests to the lumber trade and they are now subject to an imported lethal parasite Our land was a last bastion of nature on the coast of the Coromandel and we still hear kiwis, but for the last 30 years we fear we are hearing their last call, despite poison baits, possum and stoat traps and banning dogs. One unassuming dog in Northland managed to wipe out 500 tagged kiwis in a nature reserve at a sitting because one chomp on their neck crushes their lungs and they suffocate. What is extremely frustrating is that attempts to erect a possum barrier cross the tip of our peninsula has been met with vehement resistance from the farming and hunting lobby, poison drops are opposed as well even though they are helping the native species and Buddhists feel unable to control feral animals because vermin are simply conscious sentient beings with no distinction from the kiwis, so they don't protect the native species.

One moonlit night I had a vision that goes as follows. Here's the song: **Elohim**

*We are living ... on the open road
and we are carrying ... such a heavy load.
The arms of destiny ... are open in despair,
cause man is killing the creatures ... and poisoning the air.*

*We are whispering ... across the heavens
and all the creatures ... they echo in reply.*

*We are the very blood ... of the tree of life.
We are the void and the shining light.*

*We are the eternal gypsy spirits of the universe.
We have been here since it all began.
We will outlast its final passing.
We are here to free the heart of man.*

Now this is clearly related to what you are talking about when you say "spirituality". It is clearly about the eternal, from alpha to omega, and it saying that we are somehow all eternal spirit beings on an endless journey and that all of life is consciously sensitive to this as we are as conscious human beings. And it's saying exactly what you are saying about liberating humanity in freeing the heart of man.

But there is a paradox here. In the mushroom state I am an avatar and what I am experiencing is a vision that is telepathically aware with all life that has ever existed and will ever exist in future everywhere all at once, as a kind of "Fourier hologram of all souls" and I am one of them here incarnating, as I lie in the long grass among the crickets in the moonlight, listening to the waves breaking on the shore far below. No matter how ephemeral and transient mortal life is, somehow this is the quintessence that is the healing of all existential angst. To know this is to stand beyond the mortal coil and know that whatever, forever this is the joyous cosmology of eternal existence.

But the beautiful thing is that I can experience this as a state of inspired grace without having to say "I saw the face of God" or that this is the Gospel you have to believe, to have faith, or that Brahman or Vishnu pre-conceived it all, because its just the nature of naturalistic spiritual reality to see, know and experience these astounding things, and to invoke the words and sing it with one's haunting heart and soul and later make a production out of it with my son

Heath to give expression to it. It doesn't have to become religious doctrine because any time we want, we can go back into the visionary state and know this again and maybe in quite a different way. That's the divine luxury of the visionary condition. It's what Aldous Huxley tried to express in *Island* as an equally apocalyptic tale of downfall.

Note also there is no "megaGod" ruling this "spiritual realm" with a rod of adamant. It is we who are the avatars visiting the incarnate condition to bring the universe alive. We don't need to claim it's all a dream of Vishnu or that the universe was made by un-manifest Nirguna Brahman. We are already the deities and can take life as it comes. We don't need to talk about sin or the day of judgment, or moral causality because we ARE the spirits on the journey of awakening existence.

Now you came to the 1992 Rio convention quoting chatGPT "*The Earth Summit held in Rio de Janeiro in 1992 was a pivotal moment for global biodiversity conservation. At this summit, the Convention on Biological Diversity (CBD) was opened for signature, marking a global commitment to conserve biological diversity, promote sustainable use of its components, and ensure the fair and equitable sharing of benefits arising from genetic resources.*"

Now that's not quite what happened, because the US failed to ratify it and never has since and still stands as merely an associate member, because of the desire to own the natural genomes of planet Earth for US capital exploitation in a tragedy of the commons you also referred to in Garret Hardin's work.

So on 19th July 2001 to mark the near decade of non-compliance I [posted on Yahoo](#) the lyrics to another much more dreadful ditty "Jihad The Song of the Biosphere" disquietingly sung in odd fives ... in a descending refrain like the Delphic oracle brooding over poison laurel, in which the sins of the father GHW Bush in failing to ratify Rio were visited on the son GW Bush in failing to ratify Kyoto. This was utterly karmic arising directly out of an [AP posting in the local newspaper](#), so it isn't some hideous twist of my own deranged psyche.

The Hollywood Syndrome - Is the US the Global Satan ? Associated Press/NZ Herald Jun 2001 MAYBE George W. Bush has done the world a favour. When he renounced the Kyoto treaty on greenhouse emissions (because it would hurt America) he helped to peel away the mask of sanity from Uncle Sam, revealing him for what he is, in all his savagery and nonchalance a glutton and a psychopath. **Forget the Taleban, Gaddafi or the beastly Saddam Hussein, it is the United States that is out of control the wildest rogue nation of all.**

Here is an excerpt of the lyrics:

*You tell us tales of hollywood
of star wars and the common good
you told us global warming
was a litany of lies
factory chimneys were the prize*

*you claim all living creatures are your intellectual property
you fail to ratify every treaty, which doesn't give you more
have I heard this all before?*

*when it comes to the final struggle
jihad of the biosphere
there's only one true rogue nation
the great American shaitan
big brother, you are Uncle Sam.*

*walking in the twilight down in the valley of shadows
when will you comprehend
the damage you have wrought ... in your indiscretion?*

*can we undo the death trance you have set in motion?
will you discover the fabric of love that ignites us?
can we embrace the ocean of life that unites us?
all our lives long this journey has been our destination
if we get this one wrong
will there be any chance for restoration
if we waste the last shoreline
can there be any way to resurrection?*

*can we touch the sky?
can we fly so high
we'll pass right to the other side
and never fall in flames?
will we ever be the same again?*

*we'll become the living soul
the primal source the shining goal
the beginning and the end of life
the happiness and the pain
[can we bear it all again?](#)*

Then 55 days later, on the 11th Sep 2001 at 1 am, as I prepared to go to bed, we all sit up transfixed watching in real time, the very events of the jet liners passing right to the other side of the WTC towers and falling in flames. Suddenly the song had become a dark prophecy of the genocide in New York, walking in the twilight valley of shadows of the smoke and ashes of the devastation, and the painful recovery process in the "fabric of love that unites us", capped off with "can we bear it all again?" anticipating the then mayor of New York saying "the number of casualties will be more than any of us can bear". Even more disquieting "we'll become the primal source the shining goal" as if the narrator IS

the terrorist seeking the face of al-Llah, as if my "spirit" has ranged over all the collective consciousness the event evoked, with the driving force of the rhythm dulcimer evoking the cruising planes' arrival at ground zero, all locked ultimately into the impending mass extinction of the biodiversity of planet Earth caused by human folly.

Here is the video version of the song: [Jihad: Song of the Biosphere](#)

If you have the patience to watch it in full you will also see all the implications of Israel and Palestine today echoing out of the second intifada, showing today's plight continues.

Next we come to the writing of [Symbiotic Existential Cosmology](#), which is equally karmic.

I had stopped taking mushrooms for seven years because I was long sighted and had acute closed angle glaucoma, which can explode one's eyeballs overnight and had been causing me to become half-blinded when psychedelics dilated my pupils, stopping the flow of fluid in the eyeball from escaping. But then I was given a complete lens replacement in both eyes, which corrected the condition, so to find the answer to life, the universe and everything I took a half-dose of quality dried mushrooms that I grow myself, when needed, from spores.

This encounter adds another completely new dimension to the spiritual vision quest. I meditate and fall down into the epiphany of being like a jewelled chamber and there in the midst of it is Brahman both as ultimate reality and as the avatar persona engaging me, just as in a near death experience telepathically informing me that I must go back into my incarnation and save life throughout the universe, because, without mortal life caught incarnate in flagrante delicto in the centre of the cyclone of reality, Brahman is as vulnerable as I am because without mortal sentient beings to witness their presence the eternal 'Elohim are just as vulnerable as self-doomed humanity if the diversity of evolving life is allowed to be seriously depleted or liquidated, just as we cannot be sure the physical universe itself can exist without conscious observers of it, so it is not just life on the biosphere of Earth, or the human species that depends on it, but the entire cosmos that is at stake as Brian Cox warned on BBC ver the climate crisis that the extinction of life on Earth might rob the galaxy of its meaning.

There are whole dimensional layers to this experience. Firstly it is a confirmation of what psychedelic researchers call "entities" or supernatural agents (SAs) which are visionary agents having a sense of veridical agency, just like other people we meet in waking life. They are not imagined or imaginary and veridically possess all the tokens of autonomous agency and personality.

Tagliazucchi et al. (2016) found that the DMN, salience and FPN or fronto-parietal executive function network and the thalamus showed increased global connectivity under the drug but decreased within-network integrity. The increase in global connectivity observed under LSD correlated with subjective reports of ego dissolution. The authors suggested that increased cross talk between DMN, salience and FPN, when these individual networks are not functioning normally, could blur boundaries between self and world in such a way as to lead to ego dissolution, mystical experiences and the experience of SAs. ... The SA was considered to be a conscious being (96 percent), intelligent (96 percent), benevolent (78 percent), sacred (70 percent) and had agency in the world (54 percent). Most respondents believed that the SA was absolutely real, not hallucinated, with 72 percent believing that the entity continued to exist after their encounter. It is the nature of such quantum change experiences that the reality continues long after the experience as a definitive encounter.

So these are not just hallucinations while religious or pure spiritual experiences are real. In fact one can assert that they are more real both experientially and because they present new confounding insights that contradict or unravel pre-conceived religious and scriptural assumptions. They are an experience of true moksha outside our incarnations accessible to all, just as the Huichol traverse the nierika portal to the realm of the spirit ancestors.

There are also profound spiritual and religious paradigm shifts involved. Central here is that eternal Brahman is declaring with the utmost compassion: (a) that the mortal coil is the centre of the cyclone of reality, because, unlike the spirit realm it is both physical and conscious. (b) That mortal conscious existence is a/the central phenomenon of existence, not an imaginary spiritual heaven or cosmic mind making the universe. (c) That the solution to our existential dilemma and the meaning of existence is right here and now in the universe in which we consciously exist, to save and flower life in all its dimensions and assist the unfolding of a deeper and deeper biospheric consciousness so that the universe can come fully alive and aware of its own divinity. (d) That it is because we are organismically mortal sexual beings that we are making this journey of grace in our incarnations to heal the universe, and because we can't take it with us when we go, all the problems of egotism dissolve and rather than renunciation of living existence

as Buddhism teaches, we achieve this by embracing life to the full in full integration with life as a whole as compassionate avatars of existence.

This is why we are mortally sexual and have to be so, for complex sentient life to exist in the entropic universe, and no matter what our hopes and intimations of eternal immortality might be, we can fulfil these in our vision quests because through the biospheric sacraments, we are also the spiritual avatars of reality, so that any one of us could pronounce the Kingdom that lies before us but men do not see it, although the birds and fish precede us.

It is **not** the Vedas, **nor** is it Monotheism, but a radical transformation of the traditions to bring life to the very centre of the holy grail of existence. It doesn't assert that God or the cosmic mind made the universe but accepts physical reality and conscious existence as they are found empirically to be, while providing an avenue to true enlightenment biospherically through the living sacraments that are themselves and affirmation of the sacramental path that founded both the Vedas and the Christian sacramental tradition of soma and sangre.

This isn't just a second best option to religious heaven to have to live in the mortal coil, it is how the avatars of the cosmos come into being in biological participation, so that existential reality can exist and come into being more and more fully in the great consummation of Paradise on the cosmic equator in space-time.

There is no greater Mahyana than this, because it accepts and flows intimately with life as a whole, rather than renouncing it and shares all its ecstasy, joy, redemption, pain, suffering and annihilation in naked lunch in ultimate reality on the lawn of time and celebrates all its offspring throughout our generations forever.

So the consequence of this moksha epiphany that formed Symbiotic Existential Cosmology as a thing already conceived in the few moments of my meeting with Brahman like Fred Hoyle's story of "The Black Cloud" trying to inform humanity at light-speed the true nature of existence at such a pace that no human mind could take it in without blowing a fuse, going into convulsions and keeling over is the true spirituality of nature itself.

To me there is no case to answer, about whether or how to save the diversity of life. It's a visionary sine qua non. It pulses in every vein in my body and issues from the pores in my skin and the very prana, vitality or psyche that I breathe. We must protect the diversity of life, as a whole, not just so that humanity will survive in the biosphere, so that the conscious universe can flower on Earth over evolutionary time scales in which forms of consciousness we have not yet conceived can come into being. I must communicate this far and wide like mushroom spores. We are not the end of the road. Apocalypse is the covers being thrown off reality in the unveiling of scientific, psychedelic, sexual and spiritual revolution that is us finding our true calling to protect life in its natural diversity so that new experiences new life forms and new forms of cosmic consciousness can emerge.

The search for meaning in existence IS the vision quest and its resolution is natural existence, not a religious imaginary hegemony, nor a fragile technological utopia, which robs the Earth of its evolutionary fecundity for all time and leaves the tattered ashes of a Fermi self-extinction, or a whimpering hinayana of weeds, vermin and diseases amid a hothouse climate that could become like Venus, beautiful to behold in the night sky, but a deathly realm of acidic lightning storms and unliveable scorching wastes.

*I am lord of two ways. I am master of up and down.
I am as a man who is a new man, with new limbs and life,
and the light of the Morning Star in his eyes.
And I, I am on the threshold. I am stepping across the border.*

The central initiative to save humanity and the biosphere from a human-induced Fermi self-extinction needs to be articulated as a quantum change of heart and mind, which also has an integral spiritual value and is the true meaning of life, the universe and everything. This needs to be the primary sacrosanct objective of human culture, as a cultural, economic and ecological necessity. The principal catalytic arena of this process has to arise from a dedicated group of people conveying their certainty that this is the core issue causing our existential crisis and spreading the certainty to others that this is a win-win that is the only way forward that is consistent with our own long-term survival and the survival of our blue-green planet as we know it.

We are heading at near light-speed to a mass extinction of life. Wild species biomass has been reduced to a level inconsistent with evolutionary survival and species extinction rates are already apocalyptic on time scales of a good 50 millions years, taking us back long before humanity existed. Greenspoon et al. (2023) conclude that all wild land mammals alive today now have a total mass of only 22m tonnes. Humanity now weighs in at a total of around 390m tonnes. Domesticated species, such as sheep and cattle, in addition to other hangers-on such as urban rodents, add a further 630m tonnes. Thus as of 2023 all wild land mammals represent only $22/(390+630)=0.02$ or 2%. The figure has risen from 22.5 to 46 times from 2018. This is simply unsustainable and is not even taking into account endangered and vulnerable species with already low populations. Human induced zoonotic diseases including both covid-19 and the fungal plague wiping out amphibians worldwide are becoming a burgeoning risk to ourselves and all species on Earth.

We are failing to keep species essential to humanity in a robust genetic and ecological state. Both crop and horticultural plants and domesticated animals are selected for productivity rather than genetic robustness. Hyper-productive monoculture is the central basis of productivity. Many plant crops are either cloned, fast growing hybrids or increasingly genetically engineered. Many have become divorced from their natural habitats, which have in turn been all but erased by habitat exploitation. Fruit and vegetable species are increasingly seedless and lacking their wild disease resistance and nutritional value. Domestic animal species are selectively bred to the point where they are unable to cope in the wild. Rare species of medicinal or exotic dietary value are hunted to near extinction.

The future evolution of humanity and our ability to survive as a species is lethally uncoupled from biospheric survival. The interaction of climate, habitat and biodiversity, needs to be understood as a single interactive crisis coupled to lose-lose futures for human economics, health and survival. Arresting climate crisis requires biodiversity and particularly forest conservation to be a primary sine qua non of survivability to avoid desertification of the great tropical rainforest basins as well as the bordering savannahs and great agricultural grasslands. In turn, stabilising climate crisis is essential so that major biomes don't become pushed beyond their sustainable climate and expire.

1. The future of "intelligence" is confounded by an inability to understand the difference between machine "intelligence" and biological consciousness. This leaves human society conceptually naked and critically vulnerable to AI takeover, by successive waves of unemployment while humans themselves are being selected for "hive mind" rather than retaining their natural species autonomy. AI is not self-generating as all externally designed and manufactured mechanistic processes are, but is reducing the autonomy of human culture to slave-like dependence as we speak.
2. Cultural utopias are dystopias which are constitutionally fragile to instability and prone to multiple forms of Fermi self-extinction, from over-exploitation, crises disrupting fragile food supply lines, warfare and economic boom and bust, let alone acute climate crisis, mass biospheric extinction, and mutually assured nuclear holocaust. Cultural evolution is memetic rather than genetic and has no long-term conservation principles, by comparison with cumulative genetic evolution.
3. Human genetic evolution is driven by unsustainable cultural forces, such as male control of the female reproductive choice supporting human super-intelligence. Prescriptive religions are systematically out-reproducing unaffiliated populations, and social dynamics generally do not support astute reproductive choice abetting and optimising human evolution. Notions of a splitting between a genetically enhanced or engineered elite and a disadvantaged proletariat in a hand-maid's tale scenario are not viable futures.
4. We stand at the threshold of true enlightenment, thanks both to meditative traditions and the biospheric sacraments, but full enlightenment is rare to anecdotally apocryphal. If we are not already "there" in terms of human enlightenment, we need to have some concept of the human evolutionary future in terms of super-intelligence and the value and meaning of conscious existence, including the visionary state, which we don't currently have articulated.
5. Therefore we need to preserve biospheric diversity, not for diversity's sake itself but to ensure the Earth's biosphere remains able to respond to astronomical, tectonic and human-induced crises which could cause a mass extinction in which the megafauna and *Homo sapiens* would be prime victims, because of inherent cultural fragility and loss of our survival skills in the wilderness.

6. Central is preserving a third to half the Earth's habitats in as close to a wilderness state as possible, given local populations. Vast areas need to be dedicated and human populations encouraged, taught and compensated for adapting to live with living diversity, without exploiting vulnerable species beyond their natural limits.

7. A backstop position needs to be preserving those species which have the genomes to evolve into cultural species in future. For example the founding prosimians existed through the mass extinction that wiped out the dinosaurs. The most "primitive" primates are the wet-nosed strepsirrhines, consisting of the lemurs of Madagascar, galagos (bushbabies), pottos from Africa, and lorises from India and southeast Asia. Many of the species living today are endangered due to habitat destruction, hunting for bushmeat, and live capture for the exotic pet trade. Strepsirrhines are behaviourally diverse, although all are primarily arboreal (tree-dwelling). In the warmer Eocene there were many species which have become extinct, in our cooler climates, so they could diversify in a warmer world heading back toward Eocene temperatures provided we protect them now. The sister dry-nosed group of haplorhines, including Tarsiers are also targets. Otherwise, in a cataclysmic planetary crisis, we are back to rats and mice.

8. A world agreement is essential to decommission all nuclear weapons, with ballistic missile technology devoted to avoiding astronomical impacts. A strategy for protecting against a lethal nearby supernova irradiation events also needs to be enacted.

Chris: Can humanity exist without the biosphere?

 **ChatGPT:** No, humanity cannot exist without the biosphere. The biosphere encompasses all living organisms on Earth and the environments in which they live, including the atmosphere, hydrosphere (water bodies), lithosphere (solid earth), and the interactions between them.

Humanity depends on the biosphere for essential resources such as clean air, water, food, and raw materials. Additionally, the biosphere regulates Earth's climate and provides ecosystem services like pollination, nutrient cycling, and waste decomposition, which are crucial for human well-being.

If the biosphere were to collapse or significantly degrade, it would lead to catastrophic consequences for humanity. Without the biosphere's support systems, human survival would be severely compromised, making it impossible for humanity to exist in its current form. Therefore, it's vital to recognize the interconnectedness between humans and the biosphere and work towards sustainable practices to protect and preserve it.

John: I agree with ChatGPT's response. So, we both think humans should respect and protect nature, and I presume we both do that to the best of our ability at any given time. My point was it is already in the hands of every individual but not everyone makes that choice, not enough, in fact, because the result is still accelerating extinction and degradation of ecosystem health. Other than education, including moral education (not preaching), I don't know what can persuade more people and institutions to take it seriously. CIRES, where I am still affiliated, has been at the forefront of climate change research and policy, including IPCC membership, obviously giving the warning. But the science is still being soft pedalled by "stakeholders" who have made a different choice driving us into the crisis. We don't know how to fix the biosphere, we can't directly change people's minds, and as Garret Hardin said there is no known technical solution. Education and experience (perhaps harsh experience if we don't learn from education) are the only ways we learn, right? But I want to be optimistic and believe there is some knowledge or experience that will turn the tide. Even a long-shot "hypothetical" idea [like informatics] seems better than none at all, although I don't know that either, it's just what I can do.

Chris: What is the difference between this AI strategy causing mass collateral injury and death in Gaza and using phosgene and chlorine in the First World War, or bombing Hiroshima and Nagasaki in the Second? The difference is not about morality or Israel or Hamas, but as you say the difference between biological consciousness and machine intelligence.

John: Your second question is also well posed. Where is the boundary? In these prior examples, whether it counts as evil or not, the decision was human. If one only looks at results, that doesn't matter. But I actually agree with your previous statement that all of it comes down to personal choice and accountability (and thankfully for those who choose to be accountable to their own higher awareness). So that's the difference. It isn't a decision that should be

made by anything but an intuitive human being because at the very least humans are accountable to themselves. AI is not. There is moral accountability at least for that one person even if insulated from social scrutiny. Personal responsibility is the key, I think. Is that not also your view?

(10) The Evolution of Creationism and the Religious War of Evangelical Christianity against Evolutionary Science

Eugenie Scott (2009) notes the gradual evolution of Christian ideas of creation from existing philosophical ideas:

From Aristotle came a view of nature that focused not only on form but also on function. Aristotle wrote of the purpose of nature: why something existed, not just what form it took. The rain falls to make the grass grow. Deer have long legs to run away from predators. These ideas also influenced Christian theology: humans exist because they had been created by God to worship God. Explaining something by its purpose is known as teleology.

Reflecting his view of immutable forms, Aristotle classified plants and animals in terms of kinds of organisms that could be ranked in a linear "great chain of being," or "scale of nature" (scala naturae). This essentialist view fits very comfortably with the Christian doctrine of special creationism. ... The doctrine of special creationism incorporated these Greek ideas—the hierarchical ordering of nature and of design and purpose—and included the Christian idea of an omnipotent, omniscient creator who stood outside of nature. In the theology of special creationism, God created the universe at one time (taking six days in the most common view, although, as discussed in chapter 3, gap creationism considered two special creations) in essentially its present form. God created living things as we see them today for a particular environment and way of life. God also created stars and galaxies as we see them, and the planet Earth as we see it today, as the home of human beings and the creatures over which we have been given dominion and stewardship.

Many Christians and Jews had been considering the idea of the creation history as an allegory (instead of historical) long before the development of Darwin's theory of evolution. For example, Philo, whose works were taken up by early Church writers, wrote that it would be a mistake to think that creation happened in six days, or in any set amount of time. Augustine of the late fourth century who was also a former neoplatonist argued that everything in the universe was created by God at the same moment in time (and not in six days as a literal reading of the Book of Genesis would seem to require).

Scott (1998) notes that for most of European history, educated people blended the Christian and Greek views and concluded that the world was stable and largely unchanging, however with the discovery of the New World contradictions emerged:

The conception of nature as stable—and known—was troubled by the European discovery and exploration of North and South America and Oceania from about 1500 to 1800. The age of exploration exposed Europeans to huge unknown natural areas. Even if Columbus died thinking he had discovered a route to the Orient, it soon became clear to others that the animals, plants, people, and geological features he had encountered were truly from the New World.

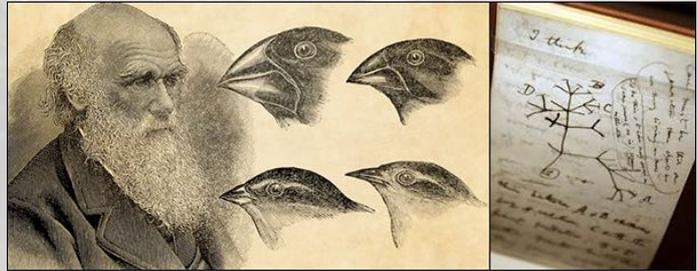

In 1665, Isaac La Peyrère produced the first version of gap creationism, proposing an explanation for these newly discovered peoples that was compatible with the Bible. He proposed that Genesis records two creations, the first being described in Genesis 1, and the second—the Adam and Eve creation—in Genesis 2. Native Americans, Polynesians, Australian Aborigines, and anyone else not specifically mentioned in the Bible were descendants of the first, or preadamite, creation. The preadamites were also the source of Cain's wife—solving another theological problem. In the second, Adamic creation, Genesis 2 and following, God created anew, and Adam and Eve were the progenitors of the more familiar human beings in Europe, Asia, and Africa. Unfortunately, this theological view generated problems of its own, raising the issue of whether preadamites were innocent of original sin. Presumably so—as they were unrelated to Adam—but then, were they in need of salvation by Jesus?

An appreciation also grew for the nature of geological processes such as sedimentation and erosion; the understanding that nature was dynamic rather than static began to grow as knowledge of the natural world – from geology as well as biology – increased through the 1700s and 1800s.

Ronald Numbers (1998) notes Darwin himself citing Creationists only a day after the publication of "Origin of Species":

When Charles Darwin published On the Origin of Species in 1859, the term "creationist" commonly designated a person who believed in the special creation of a soul for each human fetus, as opposed to a traducianist, who believed the souls of children were inherited from their parents. ... Nevertheless, just one day after the Origin of Species appeared, Darwin employed the creationist label to refer to opponents of evolution. "What a joke it would be" he wrote to Thomas Huxley "if I pat you on the back as you attack some immovable creationist". In 1873, Asa Gray published an article in The Nation saying a "special creationist" who held that species "were supernaturally originated just as they are, by the very terms of his doctrine places them out of the reach of scientific explanation" and in 1880 he briefly contrasted Darwinism with "direct creationism".

Fig 151: Darwin's tree of life from his notebook was vestigial, but his observational science, including that of his Galapagos finches was superb.

Fairbanks (2020) notes that Darwin had no access to Mendel's experiments confirming heredity, although they were contemporaries:

Mendel and Darwin were contemporaries, yet the path connecting them during their lifetimes was entirely a one-way street: Mendel was familiar with Darwin's books, having read and annotated German translations of them, whereas all available evidence indicates that Darwin knew nothing of Mendel.

This meant that Darwin had a fallacious idea of how heredity occurred although it didn't affect the validity of his findings and theory:

Darwin himself favored a blending type of inheritance in which particles (which he called gemmules) from all parts of the parents' bodies would flow to the reproductive organs, where they would be blended and passed on to offspring. But natural selection could not be combined with blending inheritance or various models on which acquired characteristics are inherited because such mechanisms would reduce genetic variation each generation (Scott 2009).

The effect of Darwin's discovery was to face the highly evolved diversity of Christian denominations with an existential crisis over the dilemma of how far to concede the natural evidence of both geology and biological evolution and how much to resist it in fundamentalistic terms. Robin Dunbar's (2022) research on the continual schismatic splitting of religious denominations around the sociobiological realities of human trust and belonging thus becomes the underlying theme for the evolution of Creationism, just as it has for religion as a whole. This spells out two important features of the Creationist movement: (1) It is reactive to a prior scientific discovery after the fact and (2) Although it claims to an older religious tradition, the evolved forms of Creationism today all date from ideas developed after Darwin which are thus newer kids on the block and cannot lay claim to ancient mandates.

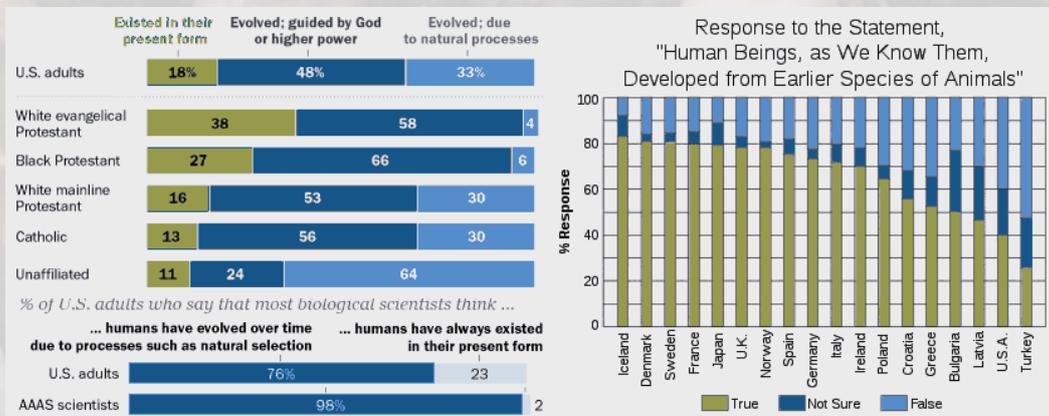

Fig 152: Left 2017 Pew Research on US views of evolution. Right: Acceptance of evolution is diminished in the US where evangelical groups wield partisan political influence over democracy 2008 (see Hecht 2006).

Indeed Creationism, as a Christian concept is not shared by Jewish people who also founded the Sabbatical Creation, but tend towards a dual reading of science and scripture: For Orthodox Jews who seek to reconcile discrepancies between science and the creation myths in the Bible, the notion that science and the Bible should even be reconciled through traditional scientific means is questioned. To these groups, science is as true as the Torah and if there seems to be a problem, epistemological limits are to blame for apparently irreconcilable points. Reform Judaism does not take the Torah as a literal text, but rather as a symbolic or open-ended work. Aviezer (2010) and Slifkin (2006) for example, publish on the subject of Torah and science allowing for divine guidance within an evolutionary paradigm.

Main-line Protestants and the Catholic Church have reconciled modern science with their faith in Creation through forms of theistic evolution which hold that God purposefully created through the laws of nature, and accept evolution. Some groups call their belief evolutionary creationism.

This means that a majority of Christians accept evolution. A 2017 poll by Pew Research found that 62% of Americans believe humans have evolved over time and 34% of Americans believe humans and other living things have existed in their present form since the beginning of time. Another 2017 Gallup creationism survey found that 38% of adults in the United States inclined to the view that "God created humans in their present form at one time within the last 10,000 years" when asked for their views on the origin and development of human beings, which Gallup noted was the lowest level in 35 years. Given the fact that Pew research in 2017 also found that over 80% of people in the US identified as Christians, this majority also applies to Christians in particular.

A theory of theistic evolution (TE) – also called evolutionary creation – proposes that God's method of creation was to cleverly design a universe in which everything would naturally evolve. Usually the "evolution" in "theistic evolution" means Total Evolution – astronomical evolution (to form galaxies, solar systems,...) and geological evolution (to form the earth's geology) plus chemical evolution (to form the first life) and biological evolution (for the development of life) – but it can refer only to biological evolution.

Some scientists and many theologians, consider science and religion to be two compatible and complementary fields, with authorities in distinct areas of human experience, so-called non-overlapping magisteria, in which they see ultimate origins and meaning being addressed by religion, but favour verifiable scientific explanations of natural phenomena over those of creationist beliefs.

However evangelical movements staunchly resisted, as Numbers (1998) details:

In 1899 Dawson, the last major nineteenth century scientist to defend special creation died. ... About the only Americans left debating the merits of special creation were conservative, often evangelical Christians. In the early 1920s the most concerned critics of human evolution launched a movement to eradicate the offending belief from the churches and schools of America. But throughout the so-called "Fundamentalist Controversy" their goal remained the elimination of evolution, not the promotion of a particular doctrine of creation. ... Evangelicals had still reached no consensus about the correct reading of genesis 1 although even the most conservative commentators had come to terms with the antiquity of life on Earth and a deluge of local or geologically superficial significance.

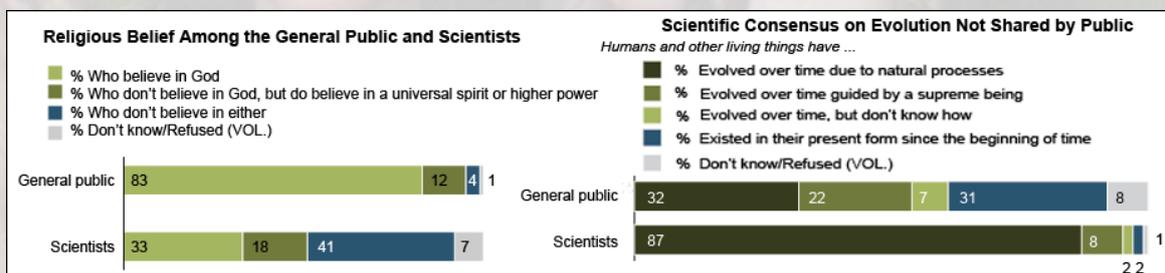

Fig 152b: 2009 Pew research. Left: In the US 83% of the general public believes in God and 95% in God or a higher power. By contrast among scientists only 33% believe in God and a bare majority of 51% in God or a higher power. Right: 87% of scientists contend natural evolution resulted in humans and another 8% allow for some divine influence, and only 2% believe in creation, while among the general public only 32% believe in natural evolution and 31% believe humans were created as is in 2009 whereas only 18% did by 2017 (above). Clearly a scientific education and experience convinces people that natural evolution is real and the general public's view is driven by both religious belief and lack of scientific experience.

The Scopes Trial, formally *The State of Tennessee v. John Thomas Scopes*, and commonly referred to as the Scopes Monkey Trial, was a 2025 American legal case in which a high school teacher, John T. Scopes, was accused of violating Tennessee's Butler Act, which had made it unlawful to teach human evolution in any state-funded school. Scopes was unsure whether he had ever actually taught evolution, but he incriminated himself deliberately so the case could have a defendant. Scopes was found guilty and was fined \$100 (equivalent to \$1,500 in 2021), but the verdict was overturned on a technicality. The trial revealed a growing chasm in American Christianity and two ways of finding truth, one "biblical" and one "evolutionist". Author David Goetz writes that the majority of Christians denounced evolution at the time. The trial publicised the Fundamentalist–Modernist controversy, which set Modernists, who said evolution was not inconsistent with religion, against Fundamentalists, who said the Word of God as revealed in the Bible took priority over all human knowledge. The case was thus seen both as a theological contest and as a trial on whether evolution should be taught in schools. The trial escalated the political and legal conflict in which strict creationists and scientists struggled over the teaching of evolution in Arizona and California science classes.

Since then, like all forms of cultural evolution, Creationism has evolved into diverse, and partially conflicting forms, often in reaction to resistance in the courts to fundamentalism and disguising religious doctrines as science:

1. **Young Earth creationists** believe that God created the Earth within the last ten thousand years, with a literalist interpretation of the Genesis creation narrative, within the approximate time-frame of biblical genealogies. Most young Earth creationists believe that the universe has a similar age as the Earth.

2 **Old Earth creationism** holds that the physical universe was created by God, but that the creation event described in the Book of Genesis is to be taken figuratively. This group generally believes that the age of the universe and the age of the Earth are as described by astronomers and geologists, but that details of modern evolutionary theory are questionable, and comes in several types:

- (a) **Gap creationism** posits that the creation period, as described in the Book of Genesis, involved six literal 24-hour days, but that there was a gap of time between two distinct creations in the first and the second verses of Genesis, which the theory states explains many scientific observations, including the age of the Earth.
- (b) **Day-age creationism** is a metaphorical interpretation of the creation accounts in Genesis. It holds that the six days referred to in the Genesis account of creation are not ordinary 24-hour days, but are much longer periods (from thousands to billions of years). The Genesis account is then reconciled with the age of the Earth. Proponents of the day-age theory can be found among both theistic evolutionists, who accept the scientific consensus on evolution, and progressive creationists, who reject it.
- (c) **Progressive creationism** is the religious belief that God created new forms of life gradually over a period of hundreds of millions of years. As a form of old Earth creationism, it accepts mainstream geological and cosmological estimates for the age of the Earth, some tenets of biology such as microevolution as well as archaeology to make its case. In this view creation occurred in rapid bursts in which all "kinds" of plants and animals appear in stages lasting millions of years. The bursts are followed by periods of stasis or equilibrium to accommodate new arrivals. These bursts represent instances of God creating new types of organisms by divine intervention. The view rejects macroevolution, claiming it is biologically untenable and not supported by the fossil record, as well as rejects the concept of common descent from a last universal common ancestor.

3. **Creation science**, or scientific creationism, is a pseudoscience that emerged in the 1960s with proponents aiming to have young Earth creationist beliefs taught in school science classes as a counter to teaching of evolution. Common features of creation science argument include: creationist cosmologies which accommodate a universe on the order of thousands of years old, criticism of radiometric dating, explanations for the fossil record as a record of the Genesis flood narrative and explanations for the present diversity as a result of pre-designed genetic variability and partially due to the rapid degradation of the perfect genomes God placed in "created kinds" due to mutations.

4. **Neo-creationism** is a pseudoscientific movement which aims to restate creationism in terms more likely to be well received by the public, by policy makers, by educators and by the scientific community. It aims to re-frame the debate over the origins of life in non-religious terms and without appeals to scripture. This comes in response to the 1987 ruling by the United States Supreme Court in *Edwards v. Aguillard* that creationism is an inherently religious concept and that advocating it as correct or accurate in public-school curricula violates the Establishment Clause of the First Amendment. One of the principal claims of neo-creationism propounds that ostensibly objective orthodox science, with a foundation in naturalism, is actually a dogmatically atheistic religion. Its proponents argue that the scientific method excludes certain explanations of phenomena, particularly where they point towards supernatural elements, thus effectively excluding religious insight from contributing to understanding the universe. This leads to an open and often hostile opposition to what neo-creationists term "Darwinism", which they generally mean to refer to evolution, but which they may extend to include such concepts as abiogenesis, stellar evolution and the Big Bang theory.

5. **Intelligent design (ID)** is the pseudoscientific view that "certain features of the universe and of living things are best explained by an intelligent cause, not an undirected process such as natural selection."

Its leading proponents are associated with the **Discovery Institute**, a think tank whose wedge strategy aims to replace the scientific method with "a science consonant with Christian and theistic convictions" which accepts supernatural explanations. This trend is replicated by the UK's **Truth in Science** and **Centre for Intelligent Design**, whose prominent figures are Christians who espouse the same pretence to be focussing on the science, rather than religion, but also explicitly support theism and like the Discovery Institute, attempt to influence the educational curriculum.

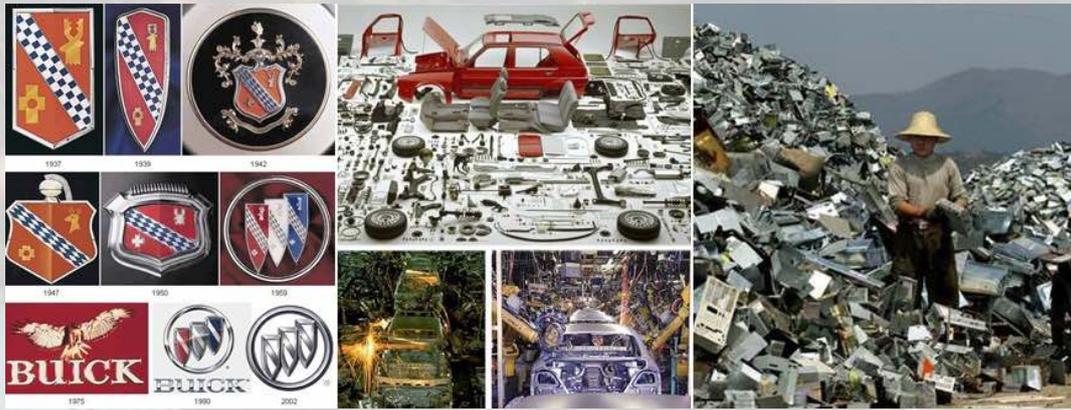

Fig 153: Intelligent design is a biospherically destructive religious concept based on applying human design and manufacture to divinity. Intelligent design is externally imposed order and it has restrictive consequences on the types of structures that can be produced, which are completely different from natural organisms, which evolve and are bootstrapped from a minimal amount of genetic information interactively in embryogenesis. Because the notion is falsely conceived on the basis of human exceptionalist religion, the entire concept is destructive to nature and biodiversity, because intelligent design applies only to the designed system and there is no spontaneously-interactive ecosystem guaranteeing recycling of natural decomposed components to new living systems. The evolution of intelligent design, is illustrated left in the Buick emblem: The intelligent designer creates each individual design de-novo, having only the same general concept. Because there is an external designer following their own predilection, there is no absolute requirement for a new design to depend in any significant way on the form of the predecessor. Both development and evolution are fundamentally a product of the designer only and not the design itself. In successive generations, one Buick shield can become three and then an Eagle. By contrast, natural evolutionary change is gradual and cumulative and leaves the fingerprint of its variation in the genomes of the ancestors and their descendants. Creationists try to finesse this discordance between the evolutionary tree of life and intelligent design by claiming God has created the universe to look like it has evolved. Corporations, and technological innovation all follow the feigned 'evolutionary' protocols of intelligent design.

Intelligent Design originated as a re-branding of creation science in an attempt to avoid a series of court decisions ruling out the teaching of creationism in American public schools, and the Discovery Institute has run a series of campaigns to change school curricula. In the US, teaching of intelligent design in public schools has been decisively ruled by a federal district court to be in violation of the Establishment Clause of the First Amendment to the United States Constitution. In *Kitzmiller v. Dover*, the court found that intelligent design is not science and "cannot uncouple itself from its creationist, and thus religious, antecedents," and hence cannot be taught as an alternative to evolution in public school science classrooms under the jurisdiction of that court. This sets a persuasive precedent, based on previous US Supreme Court decisions in *Edwards v. Aguillard* and *Epperson v. Arkansas* (1968), and by the application of the Lemon test, that creates a legal hurdle to teaching intelligent design in public school districts in other federal court jurisdictions.

Irreducible and Specified complexity Irreducible complexity claims certain biological systems cannot have evolved by successive small modifications to pre-existing functional systems through natural selection, because no less complex system would function. Irreducible complexity has become central to the creationist concept of intelligent design, but the scientific community regards intelligent design as pseudoscience and rejects the concept of irreducible complexity. Irreducible complexity is one of two main arguments used by intelligent-design proponents, alongside specified complexity. Specified complexity attempts to claim patterns that are both specified and complex must be designed, where a specified pattern is one that admits short descriptions, whereas a complex pattern is one that is unlikely to occur by chance. The concept of specified complexity is widely regarded as mathematically unsound and has not been the basis for further independent work in information theory, in the theory of complex systems, or in biology. It is contradicted by edge-of-chaos systems, from cellular automata to biology, where complexity can become generative.

Mikulecky (1999) demonstrates just how far externally designed machines are from the nature of living systems:

A machine needs a builder; it can not effect its own construction. This is the idea captured in the concept of "component systems" (Kampis, 1991) and other related ideas. Rosen (1991, 2000) has laid a nice foundation for this manner of thinking. As early as 1958 he began to imagine the way life has to come about. As time progressed, the answer he saw was revolutionary. Evolution is a process that defines itself as a system. ... Living things are not like machines at all. Machines are built from the bottom up out of parts constructed to add to each other in a supportive way. It is tempting to look at a machine and glibly say that the whole is more than the sum of the parts and think one has said something. ... This led to the modeling relation, the identification of some formalism that would define that sum, and the recognition that in every speculation about these matters models are involved. ... This led to a clear definition of what a machine is and how a machine relates to its parts. Once that was accomplished, it became

obvious that living systems relate to their parts in entirely different ways. Evolution, as does the mature organism, must be seen as the evolution of function in the form of functional components. What is more, the functional components, because they are defined by the momentary context, are not permanent features in an evolving system. To the extent that a developing system mimics its evolution the same is true for it. How can this be realized? The key to a system evolving to become an organism is that it must reach some point where it achieves all three of metabolism, repair, and replication.. We have never designed a machine like this and for very good reason. We build machines to last. One of the first and most crucial aspects of the evolving living system was its failure to last! It was in a condition of being torn down as fast as it was being built up and this is what allowed it to evolve. ... Both construction and destruction are systems properties. The systematic tearing down allows rebuilding, replication and evolution.

Witzany (2020), conveyed by Hal Cox, complements this by emphasising the modular structure of the genome and its viral contribution qualify our idea of mutation in ways which promote evolutionary innovation:

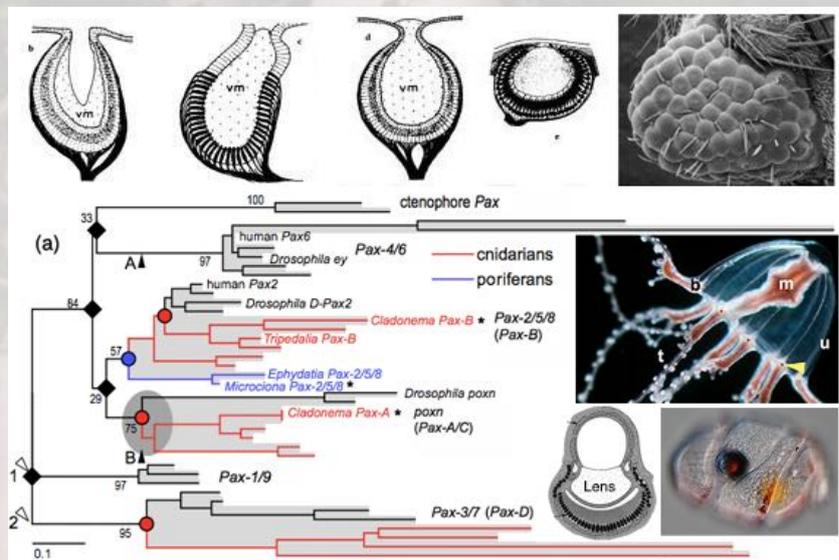

Primarily, life is a process. The main characteristic of this process is the coordinated organization of complex interactions that we see as protein-based organisms of three domains of life, their reproduction, and metabolism all mediated by complex interwoven gene regulation as a result of communication. ... Without RNA world agents, no cellular gene regulation could take place. Without viruses and related infectious agents, these capabilities of RNA stem-loop group behavior as gene inventors and regulators would not have been integrated into cellular host genomes. ... Therefore, we must ask whether mutation ("error replication") is the correct term to designate genetic variation in the future. Error replications, which in most cases means DNA damage without successful repair, is an empirical fact but does not play important roles in genetic innovation. Evolutionary relevant genetic variations are the result of natural genome editing by competent agents such as viruses and RNA networks with their inherent competence to generate and modify nucleotide sequences. This is competent nucleotide sequence editing. In contrast to former convictions, this is an agent-based interaction process, which is far from statistical mechanics and biochemical kinetics. Instead of error replication, we should use now "genetic innovation," which much better fits to the empirically documented events. Darwinian evolution then could be revised to "innovation and selection."

The creationist agenda and concepts such as irreducible complexity constitute a sustained assault on the verified science of evolutionary change now confirmed in extraordinary detail in the Human Genome Project and ensuing genetic studies of diverse species from our last common ancestor of life to Homo sapiens. My research overview: "**The Tree of Life: Tangled Roots and Sexy Shoots Tracing the genetic pathway from the Last Universal Common Ancestor to Homo sapiens**" (King 2021c) examines the genetic evidence exhaustively, proceeding in the shadow of the Human Genome Project for the next 20 years up to the present, examining every stage of genetic and phenotypic evolution from the last common ancestor of all life (LUCA) to ourselves.

Fig 154: **Deconstructing Irreducible**

Complexity I: The Camera Eye Top left:

Naturally occurring pit eyes show all forms of intermediate in the formation of the camera eye. Top Right: A compound eye on an insect leg elicited by a mouse pax gene involved in vertebrate eye development, demonstrating evolutionary homology at the genetic level between the arthropod and vertebrate developmental pathways. Lower left: Evolutionary tree of pax genes spans the metazoa. Lower right: Small camera eye in cnidaria (yellow arrow) (see also fig 256) and the camera eye in Dinoflagellates, which possess an eyespot ocelloid, complete with lens and retinoid organelle (lower right) and may have in turn inherited this functionality from cyanobacterial chloroplasts via red algae. Detailed analysis shows it to be a compound endosymbiotic structure involving both a mitochondrial 'cornea' and red-alga plastid derived retinal body comprising stacked wave-form membranes derived from chloroplast thylakoids surrounded by pigmented lipid droplets. This shows just how readily evolution can "create" an eye!

John Horgan (2019) in reviewing Quammen (2018) in "Was Darwin Wrong?" clearly states that ensuing scientific discoveries have not undermined the validity of Darwin's findings:

But Archaea do not pose a challenge to Darwinian theory, our understanding of how species originate and evolve. I would compare Archaea to a revision in our model of galaxy formation in the early universe, which does not threaten the basic big-bang framework.

Now we know that variations have many causes, including mutation, endosymbiosis, genetic drift, sexual recombination, epigenetic factors and, yes, horizontal gene transfer. But all variations, whatever form they take, serve as fodder for natural selection, which remains the primary evolutionary force, and which Darwin (and Wallace) discovered.

Creationist and religious “intelligent design” proponents, such as Michael Behe, also raise fundamental concerns about integrity of intent. Both science and the law require there not to be manifest conflicts of interest, because these fundamentally compromise the quality of an evidential account. So is it right to enter into avowed Christian creationist doctrine masquerading in the name of science in the pursuit of true meaning? Eugenie Scott for example coined the term "[Gish gallop](#)" to describe a fallacious Creationist rhetorical technique which consists of overwhelming an interlocutor with as many individually-weak arguments as possible, in order to prevent rebuttal of the whole argument. Michael Behe's (1996) claims about the irreducible complexity of essential cellular structures have been rejected by the vast majority of the scientific community, exemplified by opponents such as Jerry Coyne (2009). Tangled is in both the title of Quammen's book “The Tangled Tree: A radical new history of life” (2018) and my 2000-2020 overview, so their theses clearly coincide. Coyne (1996) in review, wryly comments on the flip-side problem of genes which appear badly designed, pointing out that Behe invites the conspiracy that the designer may have designed some things to look like evolution:

Responding to observations of non-functional genes and inefficient molecular processes, Behe theorizes that the Great Designer has goals beyond functionality: "Features that strike us as odd in a design might have been placed there by the designer for a reason -- for artistic reasons, for variety, to show off, for some as-yet-undetected practical purpose, or for some unguessable reason -- or they might not." One should add the "puckish reason": to confuse future biologists by making things look as though they evolved. ... Like all scientific creationists, Behe keeps quiet about the identity of the Great Designer, but the author's professed Roman Catholicism offers one clue. ... The book will no doubt be widely cited by Biblical creationists who will tout its message of design while ignoring its timid acceptance of evolution and its view of the creator as Cosmic Prankster. If the history of science shows us anything, it is that we get nowhere by labelling our ignorance 'God'. Behe is a senior fellow of the Discovery Institute's Center for Science and Culture. The Center for Science and Culture (CSC), formerly known as the Center for the Renewal of Science and Culture (CRSC), is part of the Discovery Institute (DI), a conservative Christian think tank. The Center for Science and Culture serves as the hub of the intelligent design movement. Nearly all of prominent proponents of intelligent design are either CSC advisors, officers, or fellows.

Creation science presented the theological argument from design with assertions that evolution could not explain complex molecular mechanisms, and in 1993 Michael Behe presented these arguments in a revised version of the school textbook “Of Pandas and People”. In “Darwin's Black Box” (1996) he called this concept irreducible complexity and said it made evolution through natural selection of random mutations impossible. This was based on the mistaken assumption that evolution relies on improvement of existing functions, ignoring how complex adaptations originate from evolving changes in function, and disregarding published research. Evolutionary biologists have published rebuttals showing how systems discussed by Behe can evolve, and examples documented through comparative genomics show that complex molecular systems are formed by the addition of components as revealed by different temporal origins of their proteins. In the 2005 Kitzmiller v. Dover Area School District trial, Behe gave testimony on the subject of irreducible complexity. The court found that "Professor Behe's claim for irreducible complexity has been refuted in peer-reviewed research papers and has been rejected by the scientific community at large."

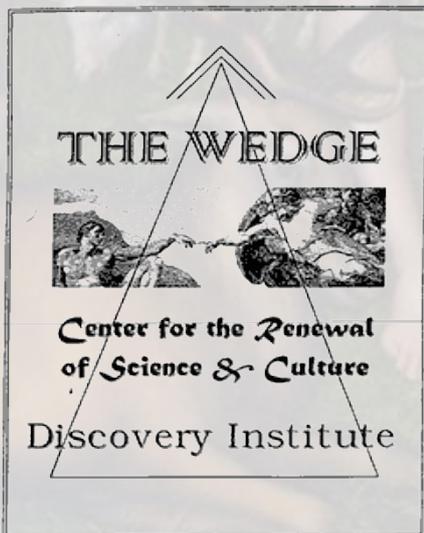

The Intelligent Design Wedge Strategy

The sheer deceit of the Creationist self-transformation into the Intelligent Design movement is carved out in an internal Discovery Institute manifesto – The Wedge Strategy (1999) – that was leaked and appeared on the Internet in 2000 now held at the [National Center for Science Education](#).

This shows the agenda is not the pursuit of true knowledge of the universe and nature but to spearhead by divisive stealth, fundamentalist Christian culture as a utopian theocratic initiative, in contradiction to transparently formed opinion. The Discovery Institute's disingenuous attempt to distance itself from its own leaked agenda and pretend it is now “scientific” can be found [here](#).

Robert Pennock (2000) in "Creationism and Intelligent Design" explains:

Guided by the Discovery Institute's "Wedge strategy," the ID movement aims to overturn evolution and what it sees as a pernicious materialist worldview and to

renew a theistic foundation to Western culture, in which human beings are recognized as being created in the image of God. The ID Movement calls its strategy for defeating evolution “the Wedge.” Its target is not just evolution, but also the materialist philosophy it believes props up science and is the de facto “established religion” of the West. The organization hopes to affect a renewal in our culture of Judeo-Christian theism, in which man is again understood as created in God’s image.

The legal idea behind the ID Wedge is to begin with a minimal position that can get into and pry open such a legal crack. Along similar lines, creationists have begun to lobby to simply teach the controversy about evolution or to get alternative theories taught, purportedly to encourage critical thinking or respect academic freedom. In keeping with the ID strategy, such proposals initially are introduced in vague, seemingly innocuous language and only later is the wedge driven in deeper. Two recent cases illustrate the point.

THE ID WEDGE

The guiding philosophy and strategic plans of the Discovery Institute’s Center for Science and Culture (CSC) are laid out in the Wedge document, an internal Discovery Institute manifesto that was leaked and appeared on the Internet in 2000. The CSC was previously named the Center for the Renewal of Science and Culture (CRSC). The Discovery Institute modified the name in 2002. Graphic banners for the CSC have also been modified over the years so that its religious underpinnings are less overt. However, the Wedge manifesto makes these explicit, laying out the CSC’s fundamental beliefs: “The proposition that human beings are created in the image of God is one of the bedrock principles on which Western civilization was built. Its influence can be detected in most, if not all, of the West’s greatest achievements, including representative democracy, human rights, free enterprise, and progress in the arts and sciences. Yet a little over a century ago, this cardinal idea came under wholesale attack by intellectuals drawing on the discoveries of modern science. Debunking the traditional conceptions of both God and man, thinkers such as Charles Darwin, Karl Marx, and Sigmund Freud portrayed humans not as moral and spiritual beings, but as animals or machines who inhabited a universe ruled by purely impersonal forces and whose behavior and very thoughts were dictated by the unbending forces of biology, chemistry, and environment. This materialistic conception of reality eventually infected virtually every area of our culture, from politics and economics to literature and art”.

CENTER FOR THE RENEWAL OF SCIENCE & CULTURE

THE proposition that human beings are created in the image of God is one of the bedrock principles on which Western civilization was built. Its influence can be detected in most, if not all, of the West’s greatest achievements, including representative democracy, human rights, free enterprise, and progress in the arts and sciences. Yet a little over a century ago, this cardinal idea came under wholesale attack by intellectuals drawing on the discoveries of modern science. Debunking the traditional conceptions of both God and man, thinkers such as Charles Darwin, Karl Marx, and Sigmund Freud portrayed humans not as moral and spiritual beings, but as animals or machines who inhabited a universe ruled by purely impersonal forces and whose behavior and very thoughts were dictated by the unbending forces of biology, chemistry, and environment. This materialistic conception of reality eventually infected virtually every area of our culture, from politics and economics to literature and art”.

devastating. Materialists denied the existence of objective moral standards, claiming that environment dictates our behavior and beliefs. Such moral relativism was uncritically adopted by much of the social sciences, and it still undergirds much of modern economics, political science, psychology and sociology.

Materialists also undermined personal responsibility by asserting that human thoughts and behaviors are dictated by our biology and environment. The results can be seen in modern approaches to criminal justice, product liability, and welfare. In the materialist scheme of things, everyone is a victim and no one can be held accountable for his or her actions.

Finally, materialism spawned a virulent strain of utopianism. Thinking they could engineer the perfect society through the application of scientific knowledge, materialist reformers advocated coercive government programs that falsely promised to create heaven on earth.

Discovery Institute’s Center for the Renewal of Science and Culture seeks nothing less than the overthrow of materialism and its cultural legacies. Bringing together leading scholars from the natural sciences and those from the humanities and social sciences, the Center explores how new developments in biology, physics and cognitive science raise serious doubts about scientific materialism and have re-opened the case for a broadly theistic understanding of nature. The Center awards fellowships for original research, holds conferences, and briefs policymakers about the opportunities for life after materialism.

The Center is directed by Discovery Senior Fellow Dr. Stephen Meyer. An Associate Professor of Philosophy at Whitworth College, Dr. Meyer holds a Ph.D. in the History and Philosophy of Science from Cambridge University. He formerly worked as a geophysicist for the Atlantic Richfield Company.

The Center seeks nothing less than the overthrow of materialism and its cultural legacies...

Discovery Institute, 1402 Third Ave. Ste. 400, Seattle, WA 98101; 206-292-0401 ext. 111; discovery@discovery.org

The preamble concludes with a statement of the ID movement’s overarching goal: “[It] seeks nothing less than the overthrow of materialism and its cultural legacies,” aiming to replace this with a “theistic understanding of nature”.

Philosopher Stephen Meyer, one of the earliest leaders of the ID movement who helped define the movement’s attack against evolution and naturalism and its revival of what he calls “the God hypothesis”, is Director of CSC, and the Wedge document echoes many of the fundamental positions he and Philip Johnson laid out.

The prevailing fact remains that for all the attempts to advance creationism or intelligent design over and above natural evolution, there is not a single instance anyone can cite, or has cited, as an actual verified example of creation in the natural world that has to have come from direct intervention in nature. No paper has been published in the peer reviewed journals. No news announcement on TV. If there were, our entire world view would be shattered overnight.

We now examine the notion of irreducible complexity in detail. This is not the overall fractal complexity of organisms and tissues, which are clearly the most complex interacting systems in the universe, but carefully chosen examples of biological systems that look like manufactured human machines, but could not apparently function in the way they now appear to do unless all their interactive parts are in place. This is a false notion because evolution is modular and functional genetic elements can be coopted in new ways for example by gene duplication and exon recombination resulting in adoption of entirely new functions by integrated gene systems, as illustrated in fig 156. Furthermore

topological changes such as gave rise to the camera eye do have a continuous set of transitional examples, as illustrated in fig 154.

One of the most incontrovertible arguments against intelligent design (ID) being demonstrated by irreducible complexity (IC), drawn attention to by Aviezer (2010), conveyed by Joshua Davis, is that of H. Allen Orr (1996). Orr's critique is a devastating theoretical attack. The fractal view of all living systems, particularly organismic tissues, as noted above, is irreducibly complex, which I'm sure we all appreciate from all the evidence in Symbiotic Existential Cosmology. But this means that evolutionary systems are examples of irreducibly complex (IC) systems which evolve, so Behe's claim that this is ID because evolution can't occur is wrong in an obvious fatal theoretical way. Orr states the core argument as follows:

First it will do no good to suggest that all the required parts of some biochemical pathway popped up simultaneously by mutation. Although this "solution" yields a functioning system in one fell swoop, it's so hopelessly unlikely that no Darwinian takes it seriously. As Behe rightly says, we gain nothing by replacing a problem with a miracle. Second, we might think that some of the parts of an irreducibly complex system evolved step by step for some other purpose and were then recruited wholesale to a new function. But this is also unlikely. You may as well hope that half your car's transmission will suddenly help out in the airbag department. Such things might happen very, very rarely, but they surely do not offer a general solution to irreducible complexity.

Behe's colossal mistake is that, in rejecting these possibilities, he concludes that no Darwinian solution remains. But one does. It is this: An irreducibly complex system can be built gradually by adding parts that, while initially just advantageous, become—because of later changes—essential. The logic is very simple. Some part (A) initially does some job (and not very well, perhaps). Another part (B) later gets added because it helps A. This new part isn't essential, it merely improves things. But later on, A (or something else) may change in such a way that B now becomes indispensable. This process continues as further parts get folded into the system. And at the end of the day, many parts may all be required.

The point is there's no guarantee that improvements will remain mere improvements. Indeed because later changes build on previous ones, there's every reason to think that earlier refinements might become necessary. The transformation of air bladders into lungs that allowed animals to breathe atmospheric oxygen was initially just advantageous: such beasts could explore open niches—like dry land—that were unavailable to their lung-less peers. But as evolution built on this adaptation (modifying limbs for walking, for instance), we grew thoroughly terrestrial and lungs, consequently, are no longer luxuries—they are essential. The punch line is, I think, obvious: although this process is thoroughly Darwinian, we are often left with a system that is irreducibly complex. I'm afraid there's no room for compromise here: Behe's key claim that all the components of an irreducibly complex system "have to be there from the beginning" is dead wrong.

This elucidation is universal to major transitions, from abiogenesis to the eucaryote emergence. In the eucaryote endosymbiosis, we know this resulted from the symbiotic integration of the two extant branches of life, archaea and bacteria, to form the energetic mitochondria, but this was accompanied by additional changes, the cell nucleus, sexual reproduction and cellular sentient excitability, but the very success of the eucaryotes means that all trace of the precursor organisms has been wiped off the face of the Earth, so the entire eucaryote organism appears to be irreducibly complex, except for the evident fact that the mitochondria are endosymbionts so we know this catastrophic merger actually took place. The same applies to abiogenesis, where we examine the living mechanisms from DNA/RNA replication, ribosomal translation and even the synthesis of individual nucleotides and this looks irreducibly complex, but in every scientific breakthrough in this area, the evidence implies (1) individual nucleotides didn't assemble from their phosphate, ribose and heterocyclic components but these arose from a more deeply chaotic spontaneous process involving unrecognised precursors, (2) that replication didn't use pristine RNA, or DNA, but hybrid molecules, (3) that coded ribosomal translation to proteins didn't impossibly arise de novo but in association with a more primitive RNA-protein hybrid world where simple polypeptides were catalysed by RNA binding. All these attest to the evolution of irreducible complexity in many stages, by new non-essential advantageous functions becoming essential over time.

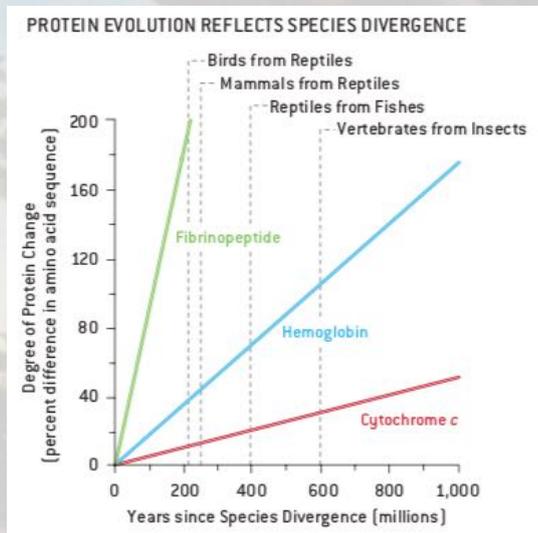

John Rennie (2002) then editor of Scientific American, stated in no uncertain terms in: "15 Answers to Creationist Nonsense" several of the main misconceptions of religious "intelligent design", stating categorically why for example the notion of irreducible complexity advanced by Behe and others is contradicted by evolutionary evidence.

Microevolution looks at changes within species over time – changes that may be preludes to speciation, the origin of new species. Macroevolution studies how taxonomic groups above the level of species change. Its evidence draws frequently from the fossil record and DNA comparisons to reconstruct how various organisms may be related.

One can be even more emphatic about this. The human genome project and associated research into ape and Neanderthal and Denisovan genomes has laid bare our evolutionary relationship with other primates. While this uses fossil evidence to identify the sources of ancient genomes, the genetic evidence on its own right is incontrovertible

evidence that humanity was not created *de novo* but evolved not just from apes but from monkeys as the Alu transposable element causing the loss of our tails makes clear (Xia et al. 2024). No longer can creationist or intelligent design proponent in any shape of form, credibly claim that humanity is in any way set apart from the macroevolutionary process that generated the diverse species of our biosphere. One doesn't any longer have to be accused of being an atheist defector against the true "faith" to accept the inevitable, fundamental truth of Darwin's discovery.

Responding to the claim that evolution, particularly macro-evolution, is unscientific, because it is not testable or falsifiable and makes claims about events that were not observed and can never be recreated he says:

The historical nature of macroevolutionary study involves inference from fossils and DNA rather than direct observation. Yet in the historical sciences (which include astronomy, geology and archaeology, as well as evolutionary biology), hypotheses can still be tested by checking whether they accord with physical evidence and whether they lead to verifiable predictions about future discoveries. For instance, evolution implies that between the earliest-known ancestors of humans (roughly five million years old) and the appearance of anatomically modern humans (about 100,000 years ago), one should find a succession of hominid creatures with features progressively less apelike and more modern, which is indeed what the fossil record shows. But one should not—and does not—find modern human fossils embedded in strata from the Jurassic period (65 million years ago). Evolutionary biology routinely makes predictions far more refined and precise than this, and researchers test them constantly.

Fig 155: Protein and species divergence linearly correlate.

Responding to claims such as Pitman's that molecular evolution and the origin of key proteins remains unestablished, Rennie cites the linear correspondence between species divergence time scales and the genetic divergence of key proteins.

Responding to Behe's irreducible complexity argument, citing the work of Kenneth Miller's (2004) 'The Flagellum Unspun: The Collapse of "Irreducible Complexity"', Rennie says the following:

What is true of the mousetrap, [Behe] says, is even truer of the bacterial flagellum, a whiplike cellular organelle used for propulsion that operates like an outboard motor. The proteins that make up a flagellum are uncannily arranged into motor components, a universal joint and other structures like those that a human engineer might specify. The possibility that this intricate array could have arisen through evolutionary modification is virtually nil, Behe argues and that bespeaks intelligent design. He makes similar points about the blood's clotting mechanism and other molecular systems.

*Yet evolutionary biologists have answers to these objections. First, there exist flagellae with forms simpler than the one that Behe cites, so it is not necessary for all those components to be present for a flagellum to work. The sophisticated components of this flagellum all have precedents elsewhere in nature, as described by Kenneth R. Miller of Brown University and others. In fact, the entire flagellum assembly is extremely similar to an organelle that *Yersinia pestis*, the bubonic plague bacterium, uses to inject toxins into cells. The key is that the flagellum's component structures, which Behe suggests have no value apart from their role in propulsion, can serve multiple functions that would have helped favor their evolution. The final evolution of the flagellum might then have involved only the novel re-combination of sophisticated parts that initially evolved for other purposes.*

Miller (2007) frames Behe's claim as follows:

Irreducibly complex structures, such as the bacterial flagellum, could not have evolved because they lack any selectable function until all of their component parts are in place. As he wrote, "any precursor to an irreducibly complex system is by definition non-functional", since every part of such a system had to be in place for natural selection to favour it. Therefore, such structures must have been designed.

Since Behe's "Black Box" and Rennie's commentary, research has proceeded apace and the situation has now become clearer. The bacterial flagellum and the type 3 secretion system injectosome (fig 156) have a common evolutionary origin, with the flagellum emerging slightly earlier. This means the genes involved are capable of evolving in multi-functional ways which are unapparent when one looks only at the flagellum.

Behe also claimed that every component of the irreducibly complex vertebrate blood-clotting system had to be present for the system to work properly. Doolittle (2004), upon whom Behe based much of his discussion of blood clotting, described it as misrepresenting a simplified explanation he had given in a lecture, and presenting a fallacious creationist miscalculation of improbability by omitting known options, which contributed to the original publisher turning down the book for publication:

Many years ago, when I was a graduate student in biochemistry at Harvard, I entered an essay in a prize competition in which submissions were made anonymously by pseudonym. The essay was entitled "The Evolution of a Unique Enzyme System: The Comparative Physiology of Blood Coagulation," and the immodest pseudonym I used was Charles Darwin. The gist of the essay was that, whereas vertebrate blood coagulation is an extremely complex process, and although at first glance no part of the system ought to be viable without the entire ensemble, it nonetheless ought to prove understandable in terms of natural selection. I pointed out that it was unlikely that the entire melange of enzymes and protein substrates evolved in one fell swoop. Instead, three processes had been at work. First, there was a series of gene duplications of the sort that had recently been observed for hemoglobins. Second, there were the simple point mutations we know today as amino acid replacements. Finally, mechanisms were brought into play that controlled the amounts of the various homologous factors. I suggested that the presence and role of these three mechanisms could be evaluated by comparing blood clotting in various organisms, particularly earlier diverging animals that might have simpler systems. To this end, I began an experimental program dealing with blood clotting in all sorts of creatures, wrote my Ph.D. dissertation on the subject, and, indeed, have devoted the intervening 35 years to the general subject of proteins and their evolution. Now it appears that I have wasted my career. In Darwin's Black Box, Michael Behe has concluded that blood clotting--Behe's "favorite pathway," as Allen Orr puts it--is simply "too complex to have evolved." Worse, he has taken one of my own articles to illustrate his view.

This caused Doolittle to spearhead work that would clearly settle this matter and Doolittle & Jiang (2003) found the Puffer fish *Fugu* has a simplified but functional clotting system, contradicting irreducible complexity and that, while the sea squirt, *Ciona intestinalis*, did not turn up any orthologs derived from a single ancestral gene for these 26 factors, paralogs from gene duplication and/or constituent domains were evident for virtually all, implying a root origin.

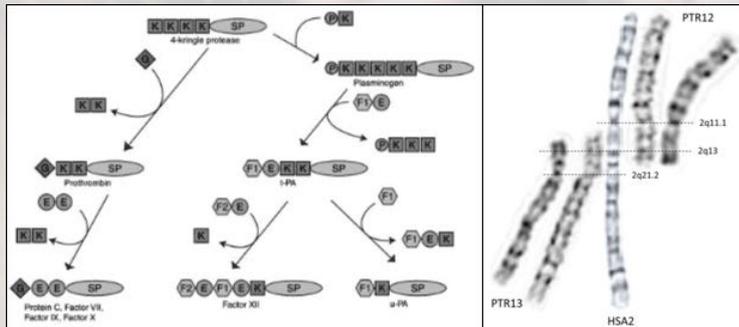

Fig 157: Left: Putative evolution of nine proteases involved in generation and destruction of fibrin clots by a small number of domain exchanges. The proposed root protein is a four-kringle protease, prototypical genes for which are found in the sea squirt genome (Doolittle & Jiang 2003). Right: Chimps have 24 chromosome pairs but humans only 23 because human chromosome 2 arose by two smaller ape chromosomes joining end on end. Such changes are major but translocations can also occur in humans without causing disabilities, although with some reduced fertility (Stankiewicz 2016).

Miller (2007) notes: *That argument collapsed when Doolittle & Jiang (2003) showed that the puffer fish, Fugu, lacks at least three clotting factors and still has a workable system. Such failures in the science of the argument helped to send intelligent design to a defeat in the Dover trial, and they haunt it still.*

In "The Edge of Evolution: The Search for the Limits of Darwinism", Behe (2007) attempts to calculate the "edge of evolution" - the point at which Darwinian evolution is no longer an efficacious agent of creative biological change - by taking into account the number of mutations required to "travel" from one genetic state to another, as well as population size for the organism in question. He argues strongly for common descent of all life forms on earth, including that humans and chimpanzees have a common ancestor, however he claims that the mutations required for bridging the higher levels of taxonomy are not possible without design. He concludes that purposeful design plays a major role in the development of biological complexity, through the mechanism of producing "non-random mutations", which are then subjected to the sculpting hand of natural selection. The argument hinges on the low probability of an organism having two or more simultaneous mutations to yield some advantage for the organism and large numbers of microbial organisms achieving little in the way of evolving new proteins and binding sites.

Dawkins (2007) notes his incorrect dependence on random mutation as the dominant force in evolution:

Behe correctly dissects the Darwinian theory into three parts: descent with modification, natural selection and mutation. Descent with modification gives him no problems, nor does natural selection. They are "trivial" and "modest" notions, respectively. The

crucial passage in *"The Edge of Evolution"* is this: "By far the most critical aspect of Darwin's multifaceted theory is the role of random mutation. Almost all of what is novel and important in Darwinian thought is concentrated in this third concept." Far more important for Darwin was the nonrandom process whereby some survived but others perished. Natural selection is arguably the most momentous idea ever to occur to a human mind, because it — alone as far as we know — explains the elegant illusion of design that pervades the living kingdoms and explains, in passing, us.

Two further reviews of this work underline the mathematical errors and lack of fundamental understanding of such processes on Behe's part. Sean Carroll (2007) in "God as Genetic Engineer" puts it this way:

He argues that the generation of a single new protein-protein binding site is extremely improbable and that complexes of just three different proteins "are beyond the edge of evolution." But Behe bases his arguments on unfounded requirements for protein interactions. He insists, based on consideration of just one type of protein structure (the combining sites of antibodies), that five or six positions must change at once in order to make a good fit between proteins—and, therefore, good fits are impossible to evolve. An immense body of experimental data directly refutes this claim. There are dozens of well-studied families of cellular proteins (kinases, phosphatases, proteases, adaptor proteins, sumoylation enzymes, etc.) that recognize short linear peptide motifs in which only two or three amino acid residues are critical for functional activity. Thousands of such reversible interactions establish the protein networks that govern cellular physiology. Very simple calculations indicate how easily such motifs evolve at random. If one assumes an average length of 400 amino acids for proteins and equal abundance of all amino acids, any given two-amino acid motif is likely to occur at random in every protein in a cell. (There are 399 dipeptide motifs in a 400-amino acid protein and $20 \times 20 = 400$ possible dipeptide motifs.) Any specific three-amino acid motif will occur once at random in every 20 proteins and any four-amino acid motif will occur once in every 400 proteins. That means that, without any new mutations or natural selection, many sequences that are identical or close matches to many interaction motifs already exist. New motifs can arise readily at random, and any weak interaction can easily evolve, via random mutation and natural selection, to become a strong interaction. Furthermore, any pair of interacting proteins can readily recruit a third protein, and so forth, to form larger complexes. Indeed, it has been demonstrated that new protein interactions and protein networks can evolve fairly rapidly and are thus well within the limits of evolution.

Kenneth Miller (2007), himself a practising Roman Catholic, in "Falling over the edge" takes an even more stringent view of the discounting evidence:

Behe cites the malaria literature to note that two amino-acid changes in the digestive vacuole membrane protein PfCRT (at positions 76 and 220) of Plasmodium are required to confer chloroquine resistance. From a report that spontaneous resistance to the drug can be found in roughly 1 parasite in 10^{12} , he asserts that these are the odds of both mutations arising in a single organism, and uses them to make this sweeping assertion:

"On average, for humans to achieve a mutation like this by chance, we would need to wait a hundred million times ten million years. Since that is many times the age of the universe, it's reasonable to conclude the following: No mutation that is of the same complexity as chloroquine resistance in malaria arose by Darwinian evolution in the line leading to humans in the past ten million years."

Behe, incredibly, thinks he has determined the odds of a mutation "of the same complexity" occurring in the human line. He hasn't. What he has actually done is to determine the odds of these two exact mutations occurring simultaneously at precisely the same position in exactly the same gene in a single individual. He then leads his unsuspecting readers to believe that this spurious calculation is a hard and fast statistical barrier to the accumulation of enough variation to drive darwinian evolution. It would be difficult to imagine a more breathtaking abuse of statistical genetics. Behe obtains his probabilities by considering each mutation as an independent event, ruling out any role for cumulative selection, and requiring evolution to achieve an exact, predetermined result. Not only are each of these conditions unrealistic, but they do not apply even in the case of his chosen example. First, he overlooks the existence of chloroquine-resistant strains of malaria lacking one of the mutations he claims to be essential (at position 220). This matters, because it shows that there are several mutational routes to effective drug resistance. Second, and more importantly, Behe waves away evidence suggesting that chloroquine resistance may be the result of sequential, not simultaneous, mutations (Science 298, 74–75; 2002), boosted by the so-called ARMD (accelerated resistance to multiple drugs) phenotype, which is itself drug induced.

A mistake of this magnitude anywhere in a book on science is bad enough, but Behe has built his entire thesis on this error. Telling his readers that the production of so much as a single new protein-to-protein binding site is "beyond the edge of evolution", he proclaims darwinian evolution to be a hopeless failure. Apparently he has not followed recent studies exploring the evolution of hormone-receptor complexes by sequential mutations (Science 312, 97–101; 2006), the 'evolvability' of new functions in existing proteins — studies on serum paraxonase (PON1) traced the evolution of several new catalytic functions (Nature Genet. 37, 73–76; 2005) — or the modular evolution of cellular signalling circuitry (Annu. Rev. Biochem. 75, 655–680; 2006). Instead, he tells his readers that there is just one explanation that "encompasses the cellular foundation of life as a whole". That explanation, of course, is intelligent design.

Behe's own Biology Department at Lehigh University published a statement repudiating Behe's views and intelligent design. The statement reads as follows:

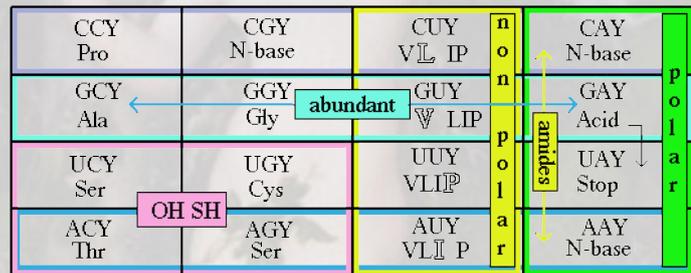

Department Position on Evolution and "Intelligent Design" The faculty in the Department of Biological Sciences is committed to the highest standards of scientific integrity and academic function. This commitment carries with it unwavering support for academic freedom and the free exchange of ideas. It also demands the utmost respect for the scientific method, integrity in the conduct of research, and recognition that the validity of any scientific model comes only as a result of rational hypothesis testing, sound experimentation, and findings that can be replicated by others. The department faculty, then, are unequivocal in their support of evolutionary theory, which has its roots in the seminal work of Charles Darwin and has been supported by findings accumulated over 140 years. The sole dissenter from this position, Prof. Michael Behe, is a well-known proponent of "intelligent design." While we respect Prof. Behe's right to express his views, they are his alone and are in no way endorsed by the department. It is our collective position that intelligent design has no basis in science, has not been tested experimentally, and should not be regarded as scientific.

The deconstruction of "intelligent design" also applies to biogenesis, where both nucleotide formation (fig 93) and ribosomal translation (fig 94) have been proved to have counter-intuitive precursors, demolishing irreducible complexity. Another far-fetched claim made by Stephen Meyer who helped found the Center for Science and Culture (CSC) of the Discovery Institute is that the genetic code is now a free and arbitrary code determining protein structure that is not dependent on chemical differences among the bases and that therefore this needs intelligent design in the form of the mind of a "programmer". This is fundamentally incorrect. Anyone who looks closely at nucleic acids can see that the four bases – purines A & G and pyrimidines T/U & C each have subtly different chemical properties and the biological amino acids do as well. So the notion that the genetic code needs a mind is false because, like all the other attributes of claimed irreducible complexity, the genetic code evolved from simpler irreducible forms of amino acid catalysis based on intrinsic chemical bifurcations like my analysis (King 1982) right. This is not a disproof, as the origin of the genetic code remains to be fully elucidated, but it shows the kind of chemical affinities which could have led to its current form.

Here's another non-sequitur deflection citing William Dembski, a senior fellow of the Discovery Institute's Center for Science and Culture (CSC), responsible for the debunked notion of specified complexity who is a mathematical theologian and should know better:

"According to Dembski, extremely improbable events that also exhibit 'an independently recognisable pattern' invariably result from intelligent causes, not chance" (Steven Meyer)

Fig 158: Chemical bifurcations consistent with the genetic code's formation.

The genetic code contains evidence for several primal bifurcations [King 1982].
 Centre position AU selects polar /non-polar as broad groups. VLIP are Val-Leu-Ileu-Phe.
 First position G determines primarily abundant amino acids.
 Expansion: first codon C and A fix synthesis routes from Glu and Asp.
 Subsequent bifurcations include H-bonding block and acid-base.

It doesn't matter how improbable a series of events is, if it has a recognisable pattern then it probably results from causes, but intelligent causes?

Consider the prime number distribution:

$\pi(N) \sim N/\log(N)$, where $\pi(N)$ is the prime-counting function (the number of primes less than or equal to N) and $\log(N)$ is the natural logarithm of N. This means that for large enough N, the probability that a random integer not greater than N is prime is very close to $1/\log(N)$. Consequently, a random integer with at most 2N digits (for large enough n) is about half as likely to be prime as a random integer with at most N digits. In other words, the average gap between consecutive prime numbers among the first N integers is roughly $\log(N)$.

So the primes very slowly get extremely improbable for very large N and they do show a recognisable pattern – no factors other than themselves and 1. But do the primes arise from intelligent causes? Only if you say God invented the integers and the laws of addition and multiplication, then the primes are automatic. But that's so basic its basal below intelligent. Does anyone have an alternative to addition, which is as basic as counting? And multiplication is just iterated addition!

An example of evidence-less propaganda presented as an academic blockbuster is the Hoover Institution video Mathematical Challenges to Darwin's Theory of Evolution, hosted by Peter Robinson on "Uncommon Knowledge". It is also prominently cited in the Discovery Institute's magazine Evolution News. In their own words: The Discovery Institute started Evolution News in 2004 to counter all the "fake news" in the debate over Darwin and intelligent

design. Since then, the audience for the English version has grown from a few thousand to more than a million users a year. This deceptive magazine title is a warning to the unwary.

The first thing to point out is that this video was NOT a "balanced" discussion between opponents and defenders of evolution at all, but rather three opponents of evolution with minimally varying views all opposing it. The notion that they are "good people" also has a Trumpian Republican implication as we shall see several times over later.

The mathematical challenge is ill conceived. the probabilistic arguments are specious and basically pulled out of thin air with massive powers of 10, forming no kind of accurate assessment of molecular dynamics at the quantum level or bearing any relation to biological reality. They are also vestigial opinions, not analyses.

Sungchul Ji notes: "I viewed this video and I disagree with Stephen Meyer. He thinks mathematics has proven that Darwinism (defined as chance origin of life) is wrong because the probability of life originated by chance is almost negligible and he cites 1 out of 10^{77} . He is assuming that the traditional mathematical approaches that have been successful in studying *simple systems* and *disorganized complex systems* apply to studying *organized complex systems* and this assumption, I think, is untenable".

The discussion claimed that neo-Darwinists thought most of the DNA was junk and the fact it wasn't junk was claimed to be an argument for intelligent design. This is a preposterous claim because we now know non-coding DNA is integral to evo-devo evolutionary developmental concept in higher organisms which creationists despise. We also know half the human genome consists of transposable elements constituting an evolutionary parasito-symbiosis with coordinated evolutionary implications. Non-coding DNA has become the hallmark of higher organism evolution because it permits coordinated regulatory developmental variation on a small subset of protein genes'

There isn't a single statement that has any evidential basis as a critique of evolution and simply constitutes three avowed critics expressing personal attitudes and opinions without presenting any evidence that could remotely be regarded as a scientific position. Given the 2.9 million views, this is outstandingly manipulative. The lack of any scientific citations is signature.

An analysis of the contributors is thus in order, each with a representative video. This makes a glaring case for extreme bias. Berlinski and Meyer are both DI – ID fellows with pronounced Christian conservatism and anti-atheism credentials. Gelernter has cloned off Meyers Darwin's Doubt to form his own variant views also rejecting evolution.

David Gelernter: The Danger of Crusading Atheists

Gelernter is known for contributions to parallel computation in the 1980s. He is in addition known for his views against women in the workforce, saying working mothers were harming their children and should stay at home. As a measure of his extreme right wing views, Peter Thiel nominated Gelernter for the Science Advisor to the President position under Trump. His rejection of the scientific consensus regarding anthropogenic climate change and evolution is also noted.

In July 2019, Gelernter challenged Darwin's theories. In Giving Up Darwin a review of Stephen Meyer's book Darwin's Doubt: The Explosive Origin of Animal Life and the Case for Intelligent Design, which Gelernter wrote for the Claremont Review of Books, Gelernter stated that he does not accept modern evolutionary biology. On the other hand, Gelernter stipulates he "cannot accept" intelligent design either, saying that "as a theory, it would seem to have a long way to go." In "A Response to David Gelernter's Attack on Evolution", Patheos, August 26, 2019, Bob Seidensticker writes: "Let's subtitle this story, 'Guy who made his career in not-biology is convinced by other not-biologists that Biology's core theory is wrong.' Computer scientist and mathematician Jeffrey Shallit wrote: "Gelernter's review was not published in a science journal, but in a politics journal run by a far-right think tank. His review cites no scientific publications at all, and makes claims like 'Many biologists agree' and 'Most biologists think' without giving any supporting citations. So, not surprisingly ... Gelernter makes a fool of himself in his review, which resembles a 'greatest hits' of creationist misconceptions and lies."

David Berlinski: Atheism and its Scientific Pretensions David Berlinski author of The Devil's Delusion: Atheism and Its Scientific Pretensions asserts that "a great many men and women have a dull, hurt, angry sense of being oppressed by the sciences. They are frustrated by endless scientific boasting. They suspect that ... the scientific community holds them in contempt. They are right to feel this way." With Darwin's theory of evolution as a point of departure, he takes

scientists to task for their anti-religious assumptions and explores the conflict between the scientific community and those with firmly held religious beliefs.

An opponent of biological evolution, Berlinski is a senior fellow of the Discovery Institute's Center for Science and Culture, a Seattle-based think tank that is a hub of the pseudoscientific intelligent design movement. Berlinski shares the movement's rejection of the evidence for evolution, but does not avow intelligent design and describes his relationship with the idea as: "warm but distant. It's the same attitude that I display in public toward my ex-wives." Berlinski is a critic of evolution, yet, "Unlike his colleagues at the Discovery Institute,...[he] refuses to theorize about the origin of life."

Stephen C. Meyer: Theistic Evolution Meyer presents the case against Theistic Evolution. From the event "Theistic Evolution: A Scientific, Philosophical, and Theological Critique," hosted by Biola University. Meyer has been described as "the person who brought ID (intelligent design) to DI (Discovery Institute)" by historian Edward Larson, who was a fellow at the Discovery Institute prior to it becoming the center of the intelligent design movement. Larsen is quoted by Chris Mooney in his book The Republican War on Science:

And then there's the aforementioned Stephen C. Meyer, a Cambridge history and philosophy of science Ph.D. who seems to have developed ID's philosophical critique of modern science to begin with. A conservative Christian with a background in Republican politics, Meyer has been described as "the person who brought ID to DI" by historian Edward Larson (who was a fellow at the Discovery Institute prior to its antievolutionist awakening). Seeking to institutionalize the ID movement, Meyer turned to the late timber industry magnate C. Davis Weyerhaeuser, a major funder of Christian evangelism in the U.S. through his Stewardship Foundation. Weyerhaeuser provided key "seed money" to establish the Discovery Institute's ID program, according to Larson.

Meyer is also a "university professor" at Palm Beach Atlantic University, in West Palm Beach, Florida, a "Christian liberal arts college" that puts its professors in what can only be described as an intellectual straitjacket. According to the school's "Guiding Principles,"

Mooney introduces the book with the following quote which is very apt to the Creationism/ID debate:

"The success of science depends on an apparatus of democratic adjudication—anonymous peer review, open debate, the fact that a graduate student can criticize a tenured professor. These mechanisms are more or less explicitly designed to counter human self-deception. People always think they're right, and powerful people will tend to use their authority to bolster their prestige and suppress inconvenient opposition. You try to set up the game of science so that the truth will out despite this ugly side of human nature" (Steven Pinker)

Cornelius Hunter (2021), again a Fellow of the Discovery Institute's Centre for Science and Culture, takes an unapologetic position, in which he subsumes scientific empiricism to theistic dominion:

In both Darwin's thought and later development of the theory of evolution, theological concerns have been viewed as serving in a range of possible roles. However, the theological concerns have consistently been viewed as, ultimately, subservient to empirical science. In the end, science has the final say regarding the content and evaluation of the theory. Here, this paper demonstrates the failure of this model. Theological concerns do have primacy over the science. They motivate the development of evolutionary theory, and they control the interpretation of the empirical evidence and justification of the theory. It is more accurate to view evolution as a theological research program.

Ian Thompson (2011) notes the way Darwin's experience of nature precipitated his religious doubts:

Charles Darwin (1809-1882) was predisposed at an early age towards naturalistic explanations but still took seriously Paley's arguments from design. Then Darwin conceived that gradualist processes of natural selection were responsible for producing the great variety of biological species and also the appearance of design within them. In this way, he was able to counter Paley's argument. Even the possibility of natural processes was presumably sufficient to rebut his inference about God. Darwin was effectively advocating a deism, because, he said, he did not want any God to exist that would be responsible for the suffering, predation and parasitism, etc., which he saw everywhere in nature. Others point out that if God was not involved, there could be no reason given for retaining a divinity at all. Darwin was claiming that God does not influence the world after creating it, and such claims reduced public support for theism.

Darwin's critique is particularly true of intelligent design. If God designed dolphins as animals, like us of climax intelligence, why did he design them to commit rape and torture smaller mammals for sport? We know the answer to the former is sexually antagonistic co-evolution, just as it is enacted by the human patriarchy in FGM and stoning for perceived adultery; and the answer to the latter is evolutionary diversification – into archaea, bacteria, plants, animals and fungi and then on among animals to the herbivores and carnivores, and we know the carnivores, to survive have

to sharpen their hunting skills through almost obsessive practice. But this is also a comment on the religious ideal of God as love and peace. Nature is wild in tooth and claw and has to be so for life to flourish.

Ian Thompson (2011), who is an unapologetic Christian nuclear physicist, takes his argument much further than intelligent design, to assert the right and necessity for God to amend natural laws at will:

One common alternative to the theory of natural selection is the theory of intelligent design. The intelligent design theory, however, is deliberately limited, as it does not attempt a causal explanation. It tries to develop techniques to examine physical organisms and then to determine whether or not that examination provides evidence for the existence of an intelligence in the coming to be (or design) of those organisms. Strictly, it is neutral on whether the intelligence is God or whether it might be previously-existing extra-terrestrial beings who have (say) genetically-engineered the organism. ... Intelligent design theory has generated an extraordinary amount of animosity from mainstream (naturalistic) scientists. They often accuse it of being false. Then they simultaneously accuse it of being non-scientific because non-falsifiable! By comparison, theistic science is advocating a much stronger theory than intelligent design since it cannot be neutral about 'the nature of the designer'. We start from the assumption that God exists, as being itself and life itself.

There are many scientists who do profess religion and think that theism and Darwin's theory can co-exist. This compatibility is possible since theism means to them that God sustains the world, and Darwin has described how creatures in the world have functioned and developed together. This view, however, is equivalent to deism, not theism. It holds that God is not involved with the world once its operation has started (except, perhaps, in special events such as the founding and/or culmination of new religions). Once 'laws of nature' are assumed to be inviolate, Darwinism can accommodate such deistic views. Within our new scientific theism we are unable to follow Darwin, in either the naturalistic or deistic world views. When God sustains the universe, this is not accomplished 'at a distance' by 'merely sustaining' the universe according to laws of physics but (we now conclude) by the presence of God in some degree. There can be no power without substance and no substance without present existence. This means that any sustaining action of God in the world will necessarily require the reception of life from God, not abstractly but as a substance really existing. This life is not always according to fixed physical laws. It necessarily has spiritual and mental components that will be effective if a suitable receptive form (e.g. a human form) is present. The fitness of a living organism is not purely a function of its interactions with the physical world and other organisms. It depends also and at least on the fullness of its reception of life from God. This implies that, within a proper theism, it is impossible to have a purely naturalistic account of evolution. Fitness, and hence selection, are not entirely natural. They are subject also to spiritual and mental considerations.

Thompson (2022) is even prepared to invoke notions that would seek to violate the foundations of physics:

I propose that the fine-tuned parameters of quantum field theory (masses and charges) can be varied locally in order to achieve ends in nature. This is not adding extra forces to nature but rescaling the forces which already exist. The unit of electric charge e is built into the fine-structure constant $\alpha=e^2/\hbar c \sim 1/137$. Some physicists have already proposed varying α slowly over the age of the universe. Some kind of variation, therefore, is conceivable in physics. Now, we propose to vary it over micro-seconds and within living organisms. ... I have shown how iterative forward and reverse steps in metric time can be used to influence intermediate variations in the vacuum permittivity to move charged bodies to achieve specific targets at a later time. This is analogous to processes of mental planning. This a start of a theory for how mental or spiritual influx could have effects in nature. Furthermore, these effects on permittivity should be measurable in biophysics experiments. With this proposal, we see after some centuries how 'final causes' could once again be seen active in nature.

I can accept bidirectional flow forwards and backwards in time in the sense of advanced and retarded quantum transactions, in which the unfolding future can be consciously anticipated for our survival. I have thought, visioned and written exhaustively to conceive and explain how these two can fit together seamlessly in the brain-mind and retain the natural universe intact. In my opinion it is the key to the middle way of conscious survival and consummation in a surviving biospheric universe. I can't and won't rightly accept spiritual causality acting over and above natural substance without a shred of empirical evidence except a priori belief in God. It leads to the loss of balance, the loss of nature and the loss of life.

I'm an existential empiricist, of both spirit and substance, to add to my existential realism that reality is evidential. Hence we do not assume God exists without evidential experience. If it walks like a duck and flies like a duck, Occam's razor implies to test if it is a duck and see first if the duck hypothesis quacks. If someone tells me God has love, jealousy, wrath and compassion, I say He talks and acts like a mammal with a limbic system, not a dragon, spider, or scorpion. If God is claimed to have wisdom, I see this also as a human attribute of learning and experience. A spiritual scientist should then seek a contradiction and ask: "Wait, this thing is conceived to be omniscient and omnipotent, immanent and omnipresent". But then we are reminded that all these "divine" attributes are those of hyperbolic projection of human nature – conceptual, through Logos to manufactural power. So I come reluctantly to the conclusion that God is a hyperbolic projection of a mammalian and in fact an all too human "psyche".

Prominently cited by [Rational wiki](#) as one of three showcase works of creationist pseudoscience, is Mike Pitman's (1985) "Adam and Evolution: A Scientific Critique of Neo-Darwinism". A New Scientist review by P T Saunders (1985) in "Another case for Creationism" notes the importance of distinguishing the fact that evolution has occurred from arguments about how it occurred. He notes that, although Pitman addressed the problem of complex structures, including both the eye and the origin of cytochrome c, showing the Neo-Darwinist explanation of macroevolution to be somewhat "flimsy", he was unconvincing about the alternatives and has clearly failed in his chief aim. Like all creationists, masquerading as "intelligent design", he has tried to hide his religion to appear scientific:

He is less convincing however in putting forth his alternative as his only real argument is that anything that has not yet been adequately explained by science counts as evidence for creationism. He also makes it very easy for himself by never specifying what sort of creator he has in mind. All we can infer is that the creator is omnipotent enough to produce all sorts of marvellous things, but is limited enough, or lazy enough, to have restricted himself to a limited number of archetypes ... The case he puts against the fact of evolution is even weaker. The fossil record does indeed contain gaps, but is is nowhere near as poor as Pitman would have us believe. Geological strata cannot be adequately explained in terms of the relative ability of different organisms to escape the rising waters of the Biblical Flood. ... Pitman clearly fails in his chief aim. ... His confident assertion that the Jesuit geologist Pierre Teilhard de Chardin perpetrated fraud not only at Piltdown, but also at Choukoutou where the Peking man was found and subsequently disappeared is to say the least contentious.

His defamatory traducing of Chardin is unfair because it was Woodward's later reconstruction that included ape-like canine teeth. In August 1913, Woodward, Dawson and Teilhard de Chardin began a systematic search of the spoil heaps specifically to find the missing canines of a skull found there. Teilhard de Chardin soon found a canine that, according to Woodward, fitted the jaw perfectly. A few days later, Teilhard de Chardin moved to France and took no further part in the discoveries. However, the intrigue continues (Lukas 1981, Thackeray 2016, 2019). Neither is there record of his fraud over the Peking man. Defaming the cherished author of the evolutionary noosphere is an unconscionable attack by a closet creationist on another Christian and those who see life and its evolution as sacred.

Mike Pitman: The Tao, Logos, Shabda, Kalma etc. are the power that drives creation (at its highest level will-power). They are the Way. And following this Path or Way leads to its Source. The Way is to heighten consciousness; it has nothing, essentially, to do with religious practices. Eventually Consciousness (stripped of mind and matter as far as ascent is concerned) is realised as the Creator. In other words, the Creator is (at present unrealised) in you.

Chris King: It is interesting the way, no matter how diverse religious paths have become, from Buddhism and Taoism, to Monotheism, Vedanta and Animism, in Mike's description what ultimately emerges is the Creator of Creation!

Mike: Also, the body itself is seen by all faiths as a prison of the soul. The phrase used was 'soul incarcerated in the flesh' (Lat. carcer, enclosure hence prison). The very reason for prayer and meditation (Jewish form or any other) is to escape from or obtain release from this material, that is, bodily realm.

Chris: The body is NOT a prison. Incarnation is the bearer of life. Anyone following this line of yours is promulgating a Faustian pact with martyrdom. Moksha is not death but the source of life's reflowering.

Mike: Many years ago, I met Sai Baba in Chennai. I was, although the audience was huge, given a seat near the front. At one point a boy sang a hymn and, as if to touch his head in blessing, Sai Baba reached out. But before reaching that place a shot of dust left his fingertips and scattered as it lost momentum. I was astonished and for a split second wondered if I was seeing things when a gasp arose all round saying 'Vibhuti'. Thus, I knew many had also simultaneously witnessed this. Those who may have power to materialise or adjust material circumstance, such as healers or those whose wish is to engender faith in others other than by telepathic means, are unlikely to want to waste time repeatedly showing off their tricks to satisfy scientific sceptics. From their perspective, why bother?

Chris: I also witnessed Sai Baba's "feats" in India. He was also renowned for sweets appearing from his images. He claimed to be the "[Kalki Avatar](#)" – the final Vishnu ending the Kali Yuga, but he has passed away and the Kali Yuga is still very much with us. So what are a few stereotyped "miracles", when there is a living world to save, or the universe could lose all sense of conscious meaning? That's why I am leaving a trail for others to follow in my "magnum opus" Symbiotic Existential Cosmology, when I am gone.

Mike: Explain yourself. Clearly and succinctly.

Chris: Physicist Brian Cox notes on the BBC ahead of COP26 warned that: "Unique events that led to civilisation mean its demise could 'eliminate meaning in the galaxy for ever'. He is right and the conclusion is that this is not just what we are doing to ourselves and the diversity of life as a whole, but the living galaxy and the universe. Particularly if you believe abiogenesis is impossible!

Mike: There are many reasons that the abiogenetic notion is vanishingly improbable (far greater than the 10^{-59} at which science normally draws the line between possibility and impossibility). However, the phase of 'chemical evolution' is critical so that normal 'scientific' response to fact is to start recreating lists of order of chemical appearances. Hope, here in the form of speculation, never dies! Your postings concerning abiogenesis and the so-called Cambrian explosion make an interesting but, since you were not there, entirely speculative account of what you have been told happened or, rather, to satisfy your basic assumptions, must have happened in some way or other.

Chris: You can't claim biogenesis is impossible and then disregard the necessity of protecting life in this planet, because in your scenario you have no guarantee it can emerge from the slime somewhere else. If a Creator had made life as it is, the universe could be teeming with clockwork crocodiles that can't evolve, but that's not what we see out there. The only life we know of is evolving here on Earth, so we need urgently to protect it.

Mike: This unnecessary reference prompts me to surmise that, if your unique, overweening and, you claim, drug-induced gospel requires chemical evolution as a sine qua non, this might be the reason for your reflex negativity towards those who, like me, do not buy your story.

Chris: The fact that biogenesis is necessary for the evolution of complex conscious life is not a reason for you to accuse me of reflex negativity. I am astutely critical of anyone who adheres to the delusory notion that life is dispensable in the Creator's Eschaton. Yes you are a cited pariah in the work!

Mike: There is one Bible-basher (his own bible) ... who is forever with the wrath of fulmination pulpitting about fundamentalist ideas such as a Creator but who never ever gives answers to questions asked of such rhetoric.

Chris: Now who could that possibly be?

Mike: Although no doubt admirably researched from its own perspective, others do not have time to read (over 200 pages usually starts a publisher frowning).

Chris: Symbiotic Existential Cosmology is currently 492 pages My Hebrew Bible is 1586 pages, so I still have a long way to go! The universe is not a trivial matter. It's not a "Mickey Mouse" theistic fait accompli. Unlike religious and cult leaders who depend on miracles, it is a fully evidenced path to realisation to reflower the planetary biosphere and redeem the human species from self-extinction. People are going to discover it and they are going to ask searching questions.

Mike: Your mind is fertile but uncontrolled. It jumps and flies everywhere. In this case you are exhibiting a typical unwillingness to confront what you see as an existential threat and deal with it consistently.

Chris: I gave you precise critiques. The existential threat is to humanity in terms of a Fermi extinction driven by religious eschatology, not to me personally.

Here is his stated position in 2022:

'Theological evolution' comes in two main forms - deistic, where some Deity touches the fuse and let's life develop as per the scientific explanation and theistic, where the view that a God-of-the-gaps (your perturber?) is responsible, instead of mindless mutation, for the same gaps as evolution-of-the-gaps addresses. This is the BIOS view. It is practically compatible with materialism except for invoking God's guidance of genetic program as opposed chance (scientific atheism's creator).

Wait! Some Christians, overawed by the apparent authority of science, decided either God lit the fuse and then, metaphorically, stepped 'outside' his creation (Darwin's sometime position called deist); or that he whimsically tinkered either genetically or to produce novel forms ex nihilo (called theistic evolution). There is no more evidence for deistic or piecemeal theistic evolution than for the implementation of a coherent ecological program for planet earth.

Anyone reading Symbiotic Existential Cosmology can understand that Mike Pitman, in addition to traducing the majority of Christians who adhere to theistic evolution, as following a delusory compromise, as well as 98% of biological scientists, is asserting that there is no evidence for "implementation of a coherent ecological program for planet earth", in complete contradiction to the entire evolution of the biosphere over 3.5 billion years and any role for the biosphere in scientific or religious cosmology and in future human survival, something we should all be diametrically opposed to for our survival as a species, and it comes piled on top of religious notions of divinely-ordained human dominion over nature, toxic to the future of life as a whole.

The problem with religious intelligent design is that it pretends to be scientific to gain credibility, while hiding the nature of the designer to avoid accusations of creationism. This is a defunct cosmology because intelligent design, without revealing the nature of the designer critical to the complete cosmology is fallacious and defunct. Ian Thompson's work, by contrast is trying to create an unlikely physics to shoehorn theism into the driving seat, by twisting the laws of nature in sleights of hand.

So there is another principle that becomes paramount and that is **the underlying motivation of the proposer**. "Underlying" says it all in poetic terms. Under (occluded) lying (misrepresenting). If a person is simply in the pursuit of true knowledge, they don't have a second agenda driving the ferry across the Styx. This is critically important because unveiling reality is an unstable process and subject to fixed illusions. The Ultimate quest is to understand reality as it is – empirically truthful and correct i.e. right as opposed to righteous.

This question of motivation pervades the notion of teleology, so the existential scientist in me says this is disingenuous. It is seeking to assert a hidden order into the edge-of-chaos of existence so that everything will "turn out right" in the eye of the beholder. It is stereotyped, well-meaning, sterile and clipping the wings of fecundity, or more correctly FGM clipping the gonads of diversity. If I stand for life overflowing across the generations forever, I have to stand for fecund wildness and not try to tame reality in our own hopeful image. I have to say बस "Bas" "enough"! Let nature be!

Nancy du Tertre: I am curious how you have concluded that we can't ever possibly be an advanced AI version created by some "god" or, said otherwise, some other earlier, more powerful, capable, insightful being(s). I am guessing you hold a soft spot in your intellect for the concept that humans are "special." Even AI has already shown glimmers of consciousness and thus perhaps a soul that must be artificial not "real" because mankind created it instead of some Higher God. So what's the difference between a real and not real soul? I would like to know.

Chris: I conclude soul is a notion, rather than an entity, or fact of existence because when soul came up in our expert group discussion, it proved to be a chameleon with diverse conflicting views among people of what soul is conceived to be. That's elementary empirical evidence for soul not having consistent existential status. I reject notions of soul connected with the pursuit of eternal life after death which I see as promissory spiritualism in defence of the biological facts of life which is that life is perennially immortal but individual organisms are mortal because sexual recombination to make complex variety is the only way conscious life can exist in the entropic universe, and this heals the dilemma of ego suffering, which Buddhism attempts to solve by renunciation of life, by devoting ourselves to life as a whole because "we can't take it with us when we go", so mortal life heals the existential dilemma by giving back to life as a whole and eternal religious visions are both fallacious and lead to extreme forms of temptation to evil.

Nancy: I'm on board with your focus on the divinity of life and existence. I treasure life and being in this glorious planet in all of its diversity. But my guess is that once I die I won't be here except as physical dust and a roaming soul/spirit. Therefore death is relevant to my limited understanding of total existence.

I asked you the question about whether humans might be the equivalent of AI creations by a more technologically advanced race of beings to see if you could admit to our obvious ignorance and inability to answer that question. I can't automatically discount it as a possibility. Nor should you.

Chris: One can't envisage any kind of created scenario unless we ignore the cosmological and evolutionary evidence for life. In any forensic investigation we have to respect the evidence at face value, not fool ourselves with a climate of denialism. The fingerprints of biogenesis are written in cosmic symmetry breaking, the molecular clouds of Orion and the lost sea vents on the ocean floor. DNA evidence for the evolution of life abounds in each of our genomes and every genome on Earth and coincides with the geological record. Denial is futile.

Evolution is resplendently creative. Creation is pathetically sterile. Intelligence and all AI by comparison with the sheer de novo unfolding of living conscious evolution is bound in a conceptual straight jacket. The genetic evolution of our biosphere is a parallel processing quantum supercomputer whose scope reduces chatGPT to triviality.

Nancy: We don't want to believe that our divinity could be just a base technology. That would be devastating. Ego crushing. However, we will go far enough to say that God was the one who created us. So on some level we do admit to being someone else's creation! But we keep it all in the Divine group of spiritual stuff. Not mundane technology. We need to believe in our own sacred existence because our life and identity are indeed sacred to us.

Chris: God and soul are just two of many animistic visions we can entertain around the campfire, some helpful but many delusory and damaging. I don't mind if you choose to believe in God at your peril but you can't make any claim that I admit to being someone else's sterile creation or attempt to deny it out of hubris. I am choosing to be compassionate of life because I am of the source – wild, primal, untrammelled and unconditioned beyond all towns and countries. Evolution and biogenesis are like that too.

You need to consider the consequences of creationism by comparison with the creativity and fecundity of life. Creation is a wholly sterile notion that can't stand on its own two feet, or six if you are an insect! You may consider belief in God is divine but disbelief in the ultimate sacredness and creative autonomy of life is a Faustian pact with death itself.

Nancy: I hear ya! I spend more time loving Nature and its "fecundity" than almost anything else. I don't spend much time, if at all, thinking about who or what created what. Not my bailiwick. Out of my league. But I do regularly express gratitude and appreciation for this wonderful "pleasure dome" that I have been able to experience. I thank God. Gratitude rebounds on itself regardless of what you believe in. Feels good. Enhances good health. Makes one feel connected to all that is.

Chris: I checked on the computational power of the biosphere and it is hands down the most powerful supercomputer ever likely to exist, let alone survive on this planet. Landenmark, Forgan & Cockell (2015), in "An Estimate of the Total DNA in the Biosphere", calculate the computational power of the biosphere to be up to 10^{15} yottaNOPS (yotta = 10^{24}), or 10^{39} Nucleotide Operations Per Second (NOPS), about 10^{22} times more processing power than the Tianhe-2 supercomputer, then the fastest in the world at on the order of 105 teraFLOPS (tera = 10^{12}). Tech Review in [2024](#) asserts that the current fastest, Frontier, runs at 1 exaflop or 10^{18} floating-point operations per second, so we arrive at a current figure of 10^{18} times the computing power of the fastest super-computer today, which although designed on low power consumption, still uses the electricity of a town with thousands of houses, placing an energy limit on any exponential expansion. Functional biospheric computational power may be significantly less. The percentage of any given genome being transcribed at any given time depends on the reproductive and physiological state of each organism, and at the current time we cannot reliably estimate this for all life on Earth. If all the DNA in the biosphere was being transcribed at reported rates, taking an estimated transcription rate of 30 bases per second, then the potential computational power is as above.

| | DNA amount (Mb) |
|------------------------|--|
| Prokaryotes | 1.6 (1.1) $\times 10^{31}$ |
| Unicellular eukaryotes | 1.3 (0.9) $\times 10^{29}$ |
| Fungi | 1.7 (3.4) $\times 10^{27}$ |
| Animals | 4.2 (1.5) $\times 10^{29}$ |
| Plants | 3.6 (3.4) $\times 10^{31}$ |
| Viruses | 4.0 (3.4) $\times 10^{29}$ |
| Total | 5.3 (3.6) $\times 10^{31}$ |

The biosphere super-computer is an organic quantum computing process operating from the level of single molecules, in both nucleotide replication and mutational change, both of which operate at the level of orbital wave functions in forms of spatial parallel superposition computing, as evidenced in protein folding rates and enzyme quantum tunnelling.

Lingam, Frank & Balbi (2023) suggest a more conservative current difference of 10^9 between information transfer in the biosphere and the technosphere as a whole. However, under the admittedly equivocal assumption of sustained exponential growth, which is profoundly unlikely, they find that information transmission in the technosphere could potentially surpass that of the biosphere ~90 years in the future. The current world population is 8×10^9 and there are 3×10^9 base pairs of human DNA, so current technosphere information corresponds to that of one DNA base, or one person alive, but comparison with the entire human population. The likelihood of growth of the current technosphere by a factor of 10^9 remains specious.

Thus there is no conceivable possibility of any form of AI achieving anywhere near the computing power of the natural intelligence (NI) that generated conscious life on Earth in the foreseeable future. No – it didn't create it, which would be a dead duck – it spawned it creatively through mutational evolution and natural selection, sexual fertility and embryogenic development, so we are – wait for it – autonomously conscious sentient beings!

The only problem for human designs to manipulate and control everything, is that this bio-computer is a law unto itself and loves to simply refine evolutionary fertility and awareness so we can't harness it to control nature. We still have no idea that AI could ever be conscious, but NI has already done it and done it so well that here we are. And we really don't need AI to solve our problems at all. It's just a pipe dream of elite human hubris to manufacture something so intelligent in mechanistic terms we can claim we have invented God, in the process, making human gainful human employment a feature of a forgotten age. All we need is good medical science to improve the quality of life and to stop trashing the planet, take the living sacraments among the crickets in the moonlight and wonder at the fabulous awesome "nature" of existence.

Chris Nunn: Interestingly many mystics, especially Sufi ones, come to suppose that they are God. Is that fantasy only or a very partial truth?

Chris King: It's both ultimate reality as it is experienced numinously and spiritual fantasy if it is subsequently represented in a world view of divinity.

Nearly all spiritually minded people seem to veer towards an elite vision that embraces a hierarchical view of order invoking deity in some form or other, whereas I am of intimate symbiosis with the diversity of life and see it as key to our survival and how the universe evolves to climax consciousness, through the biota, rather than disembodied divinity. I see conscious mortal life as the ground zero embodied manifestation of the All, which is not an independent godhead imposing a divine order on supplicant nature as creatura and think that's what our ancestors conceived of in their animistic world view that preceded religion. I identify with the All and experience it as a symbiotic eternal merging, which is pretty much what the Sufi's do and the Rishis.

Erwin Schrödinger (1944) quotes Persian Sufi mystic Aziz Nasafi:

"On the death of any living creature, the spirit returns to the spirit world and the body to the bodily world. In this way however, only the bodies are subject to change. The spiritual world is one single spirit who stands like unto a light behind the bodily world and who, when any single creature comes into being, shines through it as through a window. According to the kind and size of the window, less or more light enters the world. The light itself however remains unchanged".

That to me is right on the edge. It's not really defining God, just the light of oneness, but it's starting on the road to the Godhead so a bit precarious. I don't want to take it that far, because I see psychedelics as a way people can enter the nierika and experience the numinous for themselves. It's not a panacea or an enlightenment pill, and needs to be accompanied by all the traditional skills of meditative repose (mindfulness and annihilation as Marguerite Porete put it beautifully in "Mirror to the Simple Soul" before being burned at the stake for her vision). Sacramental mysticism opens the doors of perception so we can see into the mystery a lot more deeply, without any assumptions, so its as close to a pure reality quest as the empirical method can provide, just like the LHC.

I think that helps humanity become able to have mystical oneness without doctrine so we can all witness the Ultimate reality in the raw and return with tales of our journeys. It also comes with an implicit message of symbiosis because it is mysticism through species interdependence, but it also comes with a deep symbiotic moksha – an interdependence spiritually with life as a whole, because in the very nature of the experience, we as a species are humbly at one with all life in the cosmos. It's not a lesser moksha because pure spiritual training and discipline tends to breed an attitude of elite mind-dominant mysticism that invokes a hierarchical view of renunciation of incarnate existence, rather than a complete merging with the abundance life as a whole.

The Gospel of Thomas is the visionary inside story of Yeshua's life experience. The synoptics and John are by contrast the outer, secondary apocalyptic account:

(2) Jesus said, "Let him who seeks continue seeking until he finds. When he finds, he will become troubled. When he becomes troubled, he will be astonished, and he will rule over the All."

(3) *Jesus said, "If those who lead you say to you, 'See, the kingdom is in the sky,' then the birds of the sky will precede you. If they say to you, 'It is in the sea,' then the fish will precede you. Rather, the kingdom is inside of you, and it is outside of you. When you come to know yourselves, then you will become known, and you will realize that it is you who are the sons of the living father.*
 (77) *Jesus said, "It is I who am the light which is above them all. It is I who am the all. From me did the all come forth, and unto me did the all extend. Split a piece of wood, and I am there. Lift up the stone, and you will find me there."*

In both 2 and 77 it is **"the All"** and the way Jesus uses it is not to "rule over all". This is critical, as the inner path has Jesus referring to the All in very much the way Brahman in my [moksha epiphany](#) is envisaged and we need to learn from it and respect it. I would wager that the Father in 3 is equivalent to the All in the light of 2 & 77.

If one avoids trying to fudge the physics, as Thomson does to facilitate theistic causality operating independently of physical causality, and reflects on the [transactional](#) quantum interpretation, we already have overlapping advanced and retarded trans-causality in quantum physics under special relativity without any contrived assumptions and we don't yet know how to unravel how and whether conscious experience can use this to anticipate, although the sustained use of conscious volition by all brains appears to confirm a selective advantage to subjective conscious volition over the physical universe. Life is already doing this and we need to respect life prima facie and not contrive a divine cosmology without clear subjective or objective evidence to support it, because if we don't respect the life and the diversity of life we do have as the primary manifestation within us, we will surely end up here:

*Jesus said, "That which you have will save you if you bring it forth from yourselves.
 That which you do not have within you will kill you if you do not have it within you." (Gosp. Thomas 70)*

That which we have is life itself as long as it lasts. Guard it! Protect it! Love it humbly in all its diversity, not with spiritual ascendancy! The sanctity of life comes first. Once biodiversity is saved, we can consider all our hopes and fears for divinity.

"Richard Dawkins admits Darwinian presuppositions against God" is a two-minute [video](#) interview with Richard Dawkins and Francis Collins the ex-leader of the Human Genome Project, who is also a devoted Christian. The video, rather than exposing Dawkins as biased by his evolutionary "beliefs", casts him in an almost visionary light, *"I am in love with the idea that it is possible to explain complex things in terms of simple things. Darwin's great gift was to show that big complex things can come into existence by an explicable, understandable, beautiful, elegant process of gradual evolutionary change and that's such a beautiful idea and that inventing a big complex thing, which God must be if he exists, throws a ruddy great spanner in the way of that beautiful Darwinian concept"*. He is being honest about his own predilection, which is natural and naturally beautiful. In so doing he has transformed from a "boorish scientist" into an artist-musician of life's becoming and shown he has genuine spiritual character.

The fundamental problem with creationism is that it is the most extreme violation of Occam's razor possible. Evolution is a natural and elegantly simple process of quantum perturbation and natural and sexual selection, showing how great complexity can ensue from underlying simplicity. To invoke a creator Deity cites the ultimately complex to explain the natural, so it's the worst conceivable logical option in terms of Occam's razor. That's why affirmative belief is a trap to avoid, particularly if we are dealing with sensitive unstable processes like subjectively conscious mysticism.

But when we turn to Francis Collins, who despite being a sincere well-meaning famous scientist, we have a real problem: *"whatever ability we humans have to try to imagine what God is really like if God exists and I believe he does, has got to be so completely pathetic compared to the reality of that complexity and that awesome capability of that physicist and mathematician – a mind – I think of God as a mind, not as some greater guy in the sky, which is an unfortunate image foisted on generations of believers – I don't think God has gender and think God is a mind that is capable of things that you and I cannot possibly imagine"*.

Collins (2009) in "The Language of God: A Scientist Presents Evidence for Belief" espouses theistic evolution or evolutionary creation, which he prefers to call BioLogos – that one can "think of DNA as an instructional script, a software program, sitting in the nucleus of the cell", is talking about a very exploded version of an extremely intelligent human mind that can, not only understand the laws of nature, but literally conjure up the entire cosmos. He is also an evangelical Christian believer, believing in the Christian idea of deity as a Trinity – Jesus as the son, Abba as the father and the Holy Ghost and the whole historical happening focussed on Jerusalem in the year zero as a reality, or at least as something he can accept and worship in church and take the Eucharist upon. The assumption of Yeshua's mission

setting up the context for him as Son of God to orchestrate the Big Bang 13 billion years beforehand is putting the cosmological cart before the horse and most scientists would find it more than a hard to accept willy nilly.

Collins isn't hailing Vishnu, the sustainer, who is the archetype of the intelligent deity dreaming Brahma out of the lotus in his navel, but the Christian Trinity, so this "mind" is not the cosmic God but the Christian deity. If he has discovered the true God of reality, why is it still latched onto the Christian doctrine? Why isn't he now reciting mantras and doing deep transcendental meditation? It is consciousness itself, not intelligence, that is primary. And what of Lakshmi? Francis says his God is neuter like the Holy Ghost – a neutral mind. This is a human believer making God in his own image while still believing in evangelical Christianity as a religious movement with ambitions of religious conversion. How does this intelligence translate into how space-time and the forces get created ex nihilo? No explanation is forthcoming, because the initial assumption of God is omniscient, unimaginable and inexplicable. We have come to understand that intelligence is something that emerges within nature, it's part of life and living species, so we have a contradiction, and it needs more than intellectual intelligence to evoke the entire Universe at large.

If one tries to invoke a deity that is consistent with the natural universe, as we now know it, one ends up with a super-intelligent super-conscious agent, as Francis Collins suggests, evoking the laws of nature and evolving life, not just a man with wooly hair who says "let the Universe begin", so deity has to be refashioned post-hoc as the "provocateur" of the universe as it evolves in all its complexity, not just defining the laws of nature, but creating space-time and all that exists within it. If this is the kind of deity such religious people claim we need in the modern universe, to fill their credibility gap, why would this deity also invest Yeshua with super-human status in Jerusalem 2000 years before in an enactment of a tragedy of sacrificing his only begotten son? The two concepts of deity are entirely inconsistent. This shows just how significantly even highly intelligent belief can confound empirical discovery.

Eastern religions try to do this by realising the physical universe as aggregations of consciousness into grosser forms, but this is problematic to realise in any more than an allegorical dream time sense. We know that the standard model of physics arising from symmetry-breaking and the symmetries of the colour and electro-weak forces are interactively predisposed to fractal biogenesis and evolution explains the ongoing story and is an explicable account that makes scientific sense, as Richard Dawkins explains. Putting a creator God into the universe must at least involve realising the laws of nature, but the elegant symmetries, and symmetry-breaking of the standard model and the complementation of chaos and order could easily invoke a mandala-like creation, rather than a linguistic Logos.

Upanishadic teachings invoke Brahman as Ultimate Reality, not God; the Hindu tradition is polytheistic, consistent with reincarnation rather than creation; and Buddhism is non-theistic and doesn't accept a creation deity as the basis of its cosmology, although Hindu and Buddhist tantra does admit diverse deities and dakinis. Neither of these centrally oppose the evolutionary principle. Even Judaism doesn't assert these evangelical creationist ideas, which is predominantly feature of evangelical Christianity and some Muslim groups. The notion of a creator deity in conflict with natural evolution is thus unique to Monotheism and Christianity in particular.

If we are thinking cosmologically, the human spiritual tradition is thus not consistently theistic, so there is really no way to justify asserting a creator on the basis of world religion as a manifestation of spiritual reality, so we end up with an evangelical contingent from the Christian tradition trying to claim the mantle of the God of Creation. That is not honest cosmology, or honest belief, because it is claiming a cosmological status, when such beliefs are supported only by one, or a few religions constituting a significant minority of the world population, so even if deity is conceived as manifest in humanity, monotheism is clearly not the root condition of even highly developed religions. One thus can't legitimately claim a creator deity as having human spiritual cosmological status.

The claim that the male "Father" god of creation has manifest in history as a succession from primitive beliefs, through "pagan" polytheistic deities such as Zeus and Vishnu to the one abstract God Yahweh who then fully manifests in Yeshua's mission in the Trinity of Father, Son and Holy Ghost is a contrived patriarchal manifestation of cultural hubris in denial of spiritual diversity. Given this diversity, ALL religious traditions have to be seen to be at best allegorical accounts and not a description of the actual cosmology of the universe in which we consciously exist. No post-hoc contrivance in the light of the scientific discovery of the universe as we now know it, to invoke the universe at large as being created by a super-conscious super-causal agent has valid empirical explanatory power over nature.

This doesn't mean I don't accept the cosmic mind is a transcendent reality, or see it as anything less than a riveting revelation, but human and biospheric survival in the universe dictates that it is and has to be a symbiotic reality, in

which we, and the biota as a whole, are the incarnate embodiment, of cosmic consciousness and the All, Brahman, or mind at large is the full conscious realisation. This is not a lesser Illumination but is cosmologically true to the universe and consciousness as it is experienced empirically.

For me, even the standard model of physics is awesomely beautiful in its diverse symmetries and I haven't lost faith in the inscrutable symmetry-breaking that TOEs invoke either, despite their failure to uniquely define the universe out of many configurations, so we could well have a Taoist or mandala like big bang "creation", that is neither manufacture, nor a logos of verbal naming by a mere command – let there be Universe – the ultimate disingenuous simplicity hidden in an assumed agent of ultimate complexity!

It is because we are mortal that we are the full embodiment of "divinity" and we must needs to step up and fulfil the messianic quest of the Unveiling in our lifetime with no prior assumptions. That is what taking personal responsibility in the universe means. The mortal condition is ground zero. It's the full monte. The divine condition by contrast is ethereal. We can think of the divine condition and the universe as a dream of Vishnu emergent in Brahma who creates – Brahman ultimate reality – but the fully fleshed consciousness is mortal life itself. We manifest the All to the extent we merge with Brahman, but because we are mortal, we have to resolve the cosmic problem in our own mortal span. This means no egotistical advantage can prevail, because we can't take material gains with us when we go, so we have to apply our entire personal responsibility for the benefit of the universe and life as a whole. Nothing else furthers.

In our planetary apocalypse, this is biocrisis, climate crisis, nuclear crisis and the covers being thrown off reality in the whole make-or-break planetary rite of passage, or extinction, we are facing in real time in this anthropocene transition from which we don't know whether life, or human life, will even survive the next century, or millennium, given human impact. Our covenant with the All is to redeem the entire Universe – in our context the living planetary biosphere. We aren't just unveiling our own visionary light but the Apocalypse of reality itself. The time is now. This is it! Carpe diem!

The Human Genome Project and all the genetic sequencing done since, lays bear the entire genetic, and even epigenetic skeleton of the Tree of Life that has shaped us all. There is no way to play casting lots on the garments of the Tree of Life by religious believers once these discoveries have been made. It is futile and dangerous to allow a religion with an vowed agenda of reinforcing the Sabbatical Creation, an endearing allegory that is manifestly incorrect in multiple ways, to create disinformation that the Tree of Life, which even Revelation declares to be sacrosanct, can be "blasphemed" against, as a false construction of materialistic science. I use blasphemed here intentionally because this has both a scientific and a religious dimension.

In the midst of the street of it, and on either side of the river, was there the tree of life, which bare twelve manner of fruits, and yielded her fruit every month: and the leaves of the tree were for the healing of the nations (Rev. 22:2)

I can thus in no way do commerce with any conservative Christian apologist with an avowed fundamentalist agenda to cut the branches off the Tree of Life, by denying macro-evolution, even if masquerading in the guise of science to highjack the pursuit of true knowledge, so proponents of all forms of Creationism are well advised not to lay down the markers of a foundation dispute over this, lest they sully the credibility of their enterprise.

This is why I spent the last three months developing Symbiotic Existential Cosmology into a fully fledged extended evolutionary account including gene-culture co-evolution to specifically turn the tables on the Christian fundamentalist agenda to destroy the evolutionary basis of the Tree of Life from which we all come, in favour of an unscientific Christian doctrinal cannon, by detailing how religions themselves have evolved, and now Creationism as well, so those that cast the first stone are themselves evolutionary sinners. The fact the 98% of biological scientists respect and accept evolution is evidence that their intimate experience dealing with nature is conclusive to those who investigate it. The evidence presented here confirms, in each case that adventitious mutation filtered by natural and sexual selection are indeed sufficient to result in the evolution of the tress of life documented in geological, archaeological, genetic and phenotypic history.

Fig 159: Predatory Creationism attempts to devour the evolutionary fish of the Tree of Life.

New Wine in New Bottles

Jesus said: "It is impossible for a man to mount two horses or to stretch two bows. And it is impossible for a servant to serve two masters; otherwise, he will honor the one and treat the other contemptuously. No man drinks old wine and immediately desires to drink new wine. And new wine is not put into old wineskins, lest they burst; nor is old wine put into a new wineskin, lest it spoil it. An old patch is not sewn onto a new garment, because a tear would result." (Gospel of Thomas 47).

Creationism is old wine in old bottles,
 that treats the evolving diversity of life with just such contempt.
Religious "Intelligent Design" is old wine in old bottles, falsely labeled
 as new and fresh, when they have become vinegar and gall.
Symbiotic Existential Cosmology is new wine in new bottles.

It respects science, yet transcends materialism
 It rejects dominion over nature and sanctifies conscious life immortal.

To cast the unfolding diversity of life in the old bottles of creation would
 doom the overflowing abundance of life's evolving diversity,
 to the Day of Judgment, of a human-induced Fermi self-extinction.

I serve no master, neither am I yours, but if you want life to survive,
 drink from the bubbling spring which I have measured out (G of Th 13).

It has been apparent to me for 40 years that to achieve any real benefit for the world, I will have to defend science and the scientific method on evolution against religious attempts to assert belief in the place of discovery, while at the same time laying siege to science over freeing subjective consciousness from materialistic incarceration. For me this is a truly religious calling that has to be done by cosmological truth to nature, by setting a new paradigm of truth speaking to nature. To remind you of this, please look in detail at my own **Tree of Life**, which contains a citation requiring it not to be used to advance creationist claims, because that is exactly what I found was happening shortly after I released it on the internet.

The Triple Kernel of Symbiotic Existential Cosmology:

The core principle:

- (a) (i) I affirm consciousness as primary, (ii) I accept the universe is necessary, (iii) I recognise evolution is natural.
- (b) Subjective conscious volition has efficacy over the physical universe.
- (c) Cosmic evolution rises to immortal conscious climax through biospheric symbiosis.

This hard-won "trinity" might seem simplistic, but it's a root experiential observation, concerning the natural universe, whose significance can't be over-estimated, just as subjective conscious physical volition can't be.

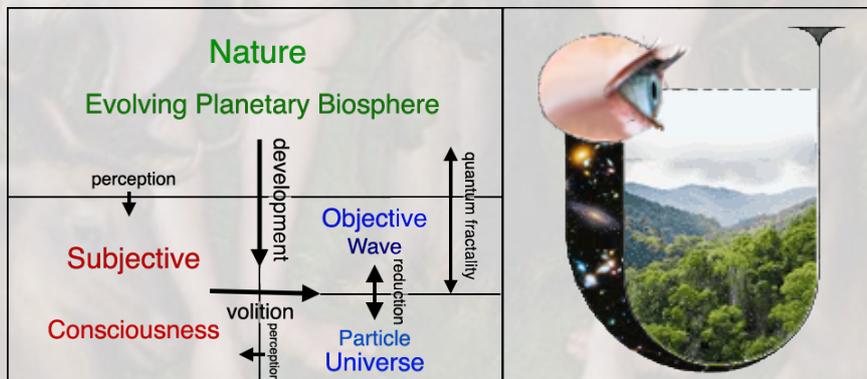

Fig 160: Left: Symbiotic Existential Cosmology as a triple nested symmetry-breaking complementarity. Right: Nature filling Wheeler's self-observing universe.

The figure illustrates the **essential cosmological role** and **sacredness of life** immanent over all forms of spiritual transcendence. On the right is JA Wheeler's self-observing universe, confirming that the physical world needs subjective consciousness to manifest, just as the divinity of cosmic consciousness needs life to become manifest. The

mass-energy dynamics of cosmology leads from cosmic inflation to the heat death or big crunch, but the quantum complexity dynamic rises to climax in living systems in which conscious biological brains are the apocalyptic epitome.

In the light of this, I conclude that:

- (a) **evolution from LUCA to Homo occurred naturally** through mutation and natural and sexual selection, without any other assistance than the nature of the quantum universe and sentient volition in natural and sexual selection,
- (b) there is **zero empirical evidence** for any need for "**divine intervention**" in the evolutionary process,
- (c) evolutionary science is **continually revealing new evidence** that irrevocably unhinges all such claims almost as soon as they are made.

Symbiotic Existential Cosmology says there are **three essential components** to the cosmos not the two of science and spirituality, or matter and consciousness. The physical aspect is **cosmology**, the subjective conscious inspiration is **existential** and the living reality that makes it all possible, as the unifying factor, is evolutionary **symbiosis**.

Therefore trying to unify science and religion is neither the point of the exercise, nor does it directly address redeeming the apocalypse of symbiotic failure of humanity. Wholeness needs to be fully embodied in living diversity. Then we can live essentially immortally throughout our generations forever, as long as the living universe lasts and unfold the great **I AM** of the universe, ever more deeply discovering and manifesting itself, in cosmic conscious awareness. While Vedanta subsumes life into the supremacy of consciousness and gross matter, failing to respect life's evolving material diversity as sacred in and of itself, Monotheism actively demotes life to humanity being overlord, as a King to his subjects veering into a clockwork orange creation.

The apocalyptic crisis the world faces is due to a failure of humanity to abide by the symbiotic basis of the living biosphere, deprecating the status of life, leading towards a self-induced Fermi extinction, so there is no way of simply trying to fuse science and belief without respecting life as the sacred manifestation of embodied consciousness that overflows the crack between the visionary and physical worlds. Symbiosis is no simple question, because it involves all processes, including predation and parasitism, in the edge of chaos climax symbiotic diversity of our biosphere.

Fools rush in where angels fear to tread, by **asserting spiritual beliefs over nature herself**, to the **discredit** of the sanctity of the **diversity of life**, and our own **future survival**.

The totality of existence and our survival can be secured only by integrating consciousness, nature and the universe into one symbiotic whole, not transcending or subjugating one aspect to another. The most vulnerable of these right now is nature. Scientific materialism seeks to explain everything from without, reducing consciousness and nature to a "lifeless" machine. Pure spirituality seeks an answer in transcendent consciousness, but in the process deposes nature and the universe to a menial status, akin to a clockwork design in creationist views, and a thought in the mind of God, or a dream of Vishnu in others. Many of us do this in more subtle ways, through imagining noospheric forces, higher beings, supernatural influences, or that supreme consciousness conceived nature and the universe.

The role of entheogenic mysticism is to regain biospheric and cosmological balance. That balance is Symbiotic Existential Cosmology, in which the three terms are a united whole. Psychic symbiosis is an evolutionary phenomenon. The entheogens evolved, so that we can survive as an intelligent species in our home biosphere. Many of us are still too proud to admit to ourselves that entheogens have this sacred evolved role to aid all of us. Through entheogenic mysticism, we regain this symbiotic integration of subject, object and nature as one. No materialistic, or spiritual path on its own can ever achieve this. We all need Symbiotic Existential Cosmology more than we can even begin to comprehend. Symbiotic Existential Cosmology is the Rosetta Stone of reality, translating the three 'languages' of existence – consciousness, nature and the universe into a unified whole.

True meaning and value. We cannot place any confidence in the notion that meaning and values can be independently defined, enticed, or induced any more than a universal morality can. All three are part of the creative process we are or should be undertaking, not defining in advance. Just as creationism begets a sterile clockwork view of imposed nature and degenerating cosmology, that can neither admit biogenesis nor evolution and cannot replicate embryogenesis, which is self-generating in a way that cannot be externally imposed, so any attempt to assert a cosmic good, from outside life, or outside the universe, cannot achieve more than a degenerate end.

The idea of an externally induced blessed realm contradicts the way life autonomously rises to climax, which is in its overall symbiotic diversity, arising from evolution at the edge of chaos, not any externally induced universal "good".

We know this is the nature of karma itself as well, as rough justice in the slings and arrows of outrageous fortune. In this a threatened native kiwi has to have a different significance value from a feral rodent or mustelid that consumes its eggs, irrespective of both being conscious sentient beings.

Climax life depends on its apex predators as key to the fertility of the entire ecosystem, keeping it balanced in a state of self-organised criticality. As an apex predatory and parasitic species upon life on Earth, *Homo sapiens* is failing its sustainable ecological niche. We need to relearn our essential beings, for it is we, not the rest of life that has lost its/our way. We thus need to learn from life and preserve its climax unfolding and not assert our notions of “universal good”, even Brahman, Ein Sof or the 'Elohim onto the diversity of life itself. I see this as a form of naturalistic epistemic humility, in the perennial long-term survival of life as a whole. This is the remedy and the respite, because in all honesty, in the mortal coil of the physical universe, conscious sentient beings can't take it with us when we go.

This is not about deprecating the hopes of religion to caring for dumb animals because it leaves the entire future open for us to make the vision quest ourselves to discover all the mysteries of conscious existence in the first person rather than through believing in unverifiable deities that may be a product of our own visionary consciousness. Neither does it hold us back from a sustainable technological living culture, including expert medical care and high standards of living, provided we protect the planet and its climate and habitats in a resilient state. Failing that, human culture is so fragile to our own destructive misadventure that we need to look to other more naturally resilient species such as the threatened stem primates from tarsiers to pottos that could survive in a warmer world as they did in the Eocene 50m years ago.

The Noosphere, Symbiosis and the Omega Point

The noosphere is a philosophical concept developed and popularised by the Vladimir Vernadsky, and Pierre Teilhard de Chardin. Vernadsky defined the noosphere as the new state of the biosphere and described as the planetary "sphere of reason". The noosphere represents the highest stage of biospheric development, its defining factor being the development of humankind's rational activities. The word is derived from the Greek νόος ("mind", "reason") and σφαῖρα ("sphere"), in analogy to "atmosphere" and "biosphere". Vernadsky and de Chardin developed two related but starkly different concepts, the former being grounded in the geological sciences, and the latter in theology. Both conceptions of the noosphere share the common thesis that together human reason and the scientific thought has created, and will continue to create, the next evolutionary epoch as part of the evolutionary chain – geological to biological to mental.

The term noosphere was first used in the publications of Pierre Teilhard de Chardin in 1922 in his Cosmogogenesis. Vernadsky was most likely introduced to the term by a common acquaintance, Édouard Le Roy, during a stay in Paris. Both Teilhard de Chardin and Vernadsky base their conceptions of the noosphere on the term 'biosphere', developed by Edward Suess in 1875. In contrast to the conceptions of the Gaia theorists, or the promoters of cyberspace, Vernadsky's noosphere emerges at the point where humankind, through the mastery of nuclear processes, begins to create resources through the transmutation of elements. It is a study area of the Global Consciousness Project.

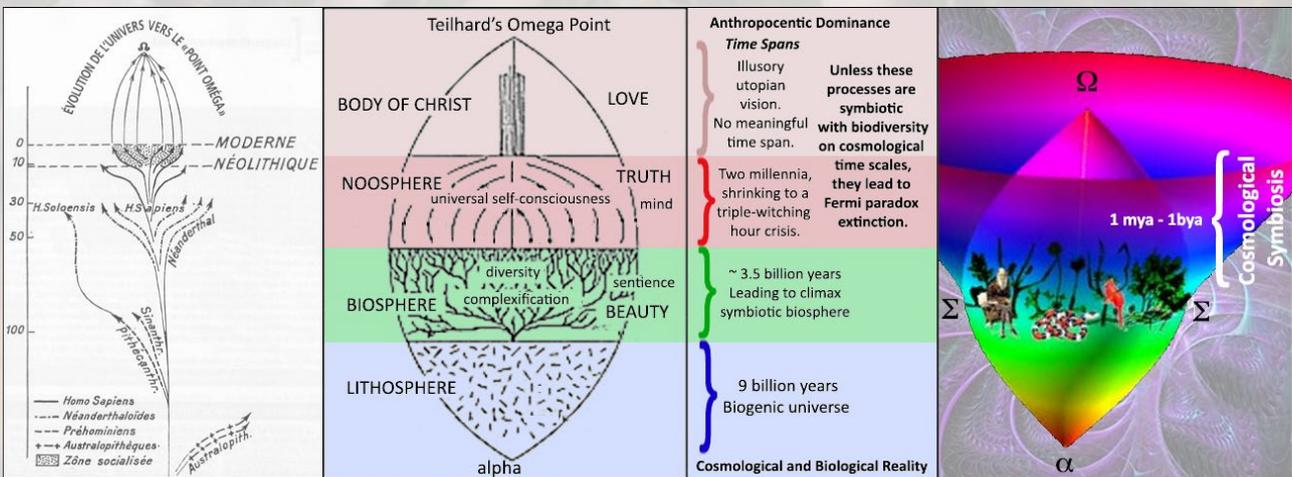

Fig 161: Teilhard de Chardin's eschatology (left) and cosmology (centre) from John Morton's works. (Right) Symbiotic Existential Cosmology – Paradise on the Cosmic Equator in Space-time.

In contrast to the conceptions of the Gaia theorists, or the promoters of cyberspace, Vernadsky's noosphere emerges at the point where humankind, through the mastery of nuclear processes, begins to create resources through the transmutation of elements. It is a study area of the Global Consciousness Project, a parapsychology experiment begun in 1998 as an attempt to detect possible interactions of "global consciousness" with physical systems. The project monitors a geographically distributed network of hardware random number generators in a bid to identify anomalous outputs that correlate with widespread emotional responses to sets of world events, or periods of focused attention by large numbers of people. According to Kurzweil's (2005) and Vinge's (2013) technological singularity hypothesis, the noosphere would be in the future the natural environment in which 'human-machine superintelligence' emerges to reach the point of technological singularity, critiqued as a crisis of the noosphere (Lahoz-Beltra 2014).

Pierre Teilhard de Chardin (1955, 1959) perceived a directionality in evolution along an axis of increasing Complexity/Consciousness. For Teilhard, the noosphere is the sphere of thought encircling the earth that has emerged through evolution as a consequence of this growth in complexity/consciousness. As a result, he sees the "social phenomenon [as] the culmination of and not the attenuation of the biological phenomenon." These include legal, educational, religious, research, industrial and technological systems. In this sense, the noosphere emerges through and is constituted by the interaction of human minds. He argued the noosphere evolves towards ever greater personalisation, individuation and unification of its elements. He saw the Christian notion of love as being the principal driver of "noogenesis", the evolution of mind. Evolution would culminate in the Omega Point — an apex of thought/consciousness — which he identified with the eschatological return of Christ.

The Phenomenon of Man was published in 1955 but the text was written in the 1930s, and achieved publication only posthumously. Chardin's view of evolution is absolutely visionary. He respects the scientific opinion on natural evolution but does not disregard the possibility of directed effects. He is utterly respectful of nature and awed by the species diversity:

Anyone who wishes to think in terms of evolution, or write about it, should start off by wandering through one of those great museums — there are four or five in the world — (at the cost of efforts whose heroism and spiritual value will one day be understood) a host of travellers has succeeded in concentrating in a handful of rooms the entire spectrum of life. There, without bothering on names, let him surrender himself to what he sees around him, and become impregnated by it: by the universe of the insects whose "reliable" species are counted in the tens of thousands; by the molluscs, thousands more, inexhaustibly variegated in their marblings and their convolutions; by the fishes, unexpected, capricious and as prettily marked as butterflies, by the birds, hardly less extravagant, of every form, feather and beak; by the antelopes of every coat carriage and diadem. ... And to think that all we see are merely the survivors What would it be like of all the others were there too? In every epoch of the Earth, on every level of evolution, other museums would have displayed the same teeming luxuriance. Added together, the hundreds of thousands of names in our catalogues do not amount to one millionth of the leaves that have sprung forth so far on the tree of life.

He specifically supports macroevolution, the key target of creationists:

*Since the heroic times of Lamarck and Darwin, the favourite argument employed against the transformists has always lain in pointing out their incapacity to prove the **birth** of a species in terms of **material traces** 'Admittedly you show us' say these objectors 'a succession of varying forms in past ages and we will even concede that you are able to demonstrate the transformation of those forms within certain limits. But however you put it, your first mammalian is already a mammal, your first equine is already a horse. Accordingly, though there may well be evolution within a given type, we see no new type produced by evolution'. So the increasingly rare survivors of the 'fixed species' school still contend. ... Nothing is so delicate and fugitive by its very nature as a first beginning. As long as a zoological group is young, its characters remain indeterminate, its structure precarious and its dimensions scant. It is composed of relatively few individual units and these change rapidly.*

He sees biological evolution as intimately entangled with the rise of consciousness, in a form of panpsychism:

*From an inward point of view, constantly confirmed by ever-increasing harmonies, the different objects of science become visible in proper perspective and in their true proportions. And at the heart of life, explaining its progression, the impetus of a rise in consciousness. ... How can life respect determinisms on the **without** and yet act in freedom **within**? ... To write the natural history of the world, we should need to be able to follow it from **within**. It would thus appear no longer as an interlocking succession of structural types replacing one another, but the ascension of an inner sap of consolidated instincts. Right at its base the living world is constituted by consciousness clothed in flesh and bone. From the biosphere to the species, this is nothing but an immense ramification of psychism seeking for itself through different forms. That is where Ariadne's thread leads us if we follow it to the end.*

He admits this view may be too Lamarckian for some but regards it as integral by conscious selection:

*In various quarters, I shall be accused of showing too Lamarckian a bent in the explanations, of giving an exaggerated influence to the **Within**, but remember that an essential part is left to the Darwinian play of external forces and to chance, but strokes of chance which are recognised and grasped — that is to say psychically selected.*

This becomes the key to his transition to the noosphere, the cultural 'thought sphere' he conceived as bringing about the union of spiritual consciousness in a social, cultural and spiritual coalescence:

Fig 161b: Tree of Life from Chardin (1955) from Cuénot, whose genetic studies on mice, followed in the footsteps of Mendel's on plant genetics, but were cut short when German troops invaded Nancy, where he kept his mouse colony. After the First World War, he never returned to his studies on mice and moved on to designing a theory of evolution, halfway between en vogue French Lamarckism and Darwinism.

We have seen and admitted that evolution is an ascent towards consciousness. That is no longer contested even by the most materialistic, or at all events by the most agnostic of humanitarians. Therefore it should culminate forwards in some sort of supreme consciousness. But must not that consciousness, if it is to be supreme, contain in the highest degree what is the perfection of our consciousness—the illuminating involution of the being upon itself? ... The consciousness of each of us is evolution looking at itself and reflecting upon itself.

Chardin's vision ultimately leads to the cosmic Christ, even the intimation of an evolutionary entheogenic sacramental Eucharist:

To live and develop the Christian outlook needs an atmosphere of greatness and coherence. ... In a pluralistic and static Nature, the universal domination of Christ could strictly speaking still be regarded as an extrinsic and superimposed power. In a spiritually converging world this 'Christic' energy acquires an urgency and intensity of another order altogether. If the world is convergent and if Christ occupies its centre then the Christogenesis of St. Paul and St. John is nothing else and nothing less than the extension, both awaited and unhoped for of that noogenesis in which cosmogenesis – as regards our experience – culminates. Christ invests himself organically with the very majesty of his creation. ... To be able to say literally to God that one loves him not only with all one's body, all one's heart and all one's soul but with every fibre of the living universe – that is a prayer that can only be made in space-time.

*Evolution has come to infuse **new blood**, so to speak into the perspectives and aspirations of Christianity. In return, is not the Christian faith destined, is it not preparing, to save and even take the place of evolution?*

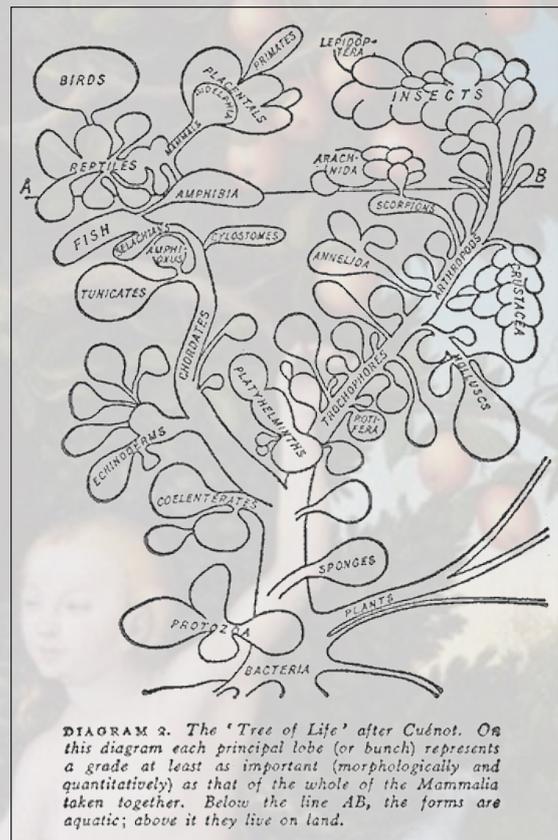

Susan Rakoczy notes that on his desk Teilhard had a picture of the Sacred Heart and "My Litany":

"The God of evolution, The Christic, the Trans-Christ Sacred Heart ... the motor of evolution the heart of evolution, the heart of matter The heart of God ... the world-zest.

The activant of Christianity ... the essence of all energy. Heart of the world's heart, Focus of ultimate and universal energy Centre of the cosmic sphere of cosmogenesis Heart of Jesus, heart of evolution, unite me to yourself."

What "taking the place of evolution" is, in the anthropocene age of the mass extinction of biodiversity, is anyone's guess, as we shall see from more recent utopian versions of the noosphere, in the era of the world wide web and artificial intelligence.

Henri Bergson's "L'évolution créatrice" (1907), was one of the first to propose evolution is "creative" and cannot necessarily be explained solely by natural selection through a vital force which animates life and fundamentally connects mind and body. In 1923, C. Lloyd Morgan took this work further, elaborating on an "emergent evolution" which could explain increasing complexity (including the evolution of mind). Morgan found many of the most interesting changes in living things have been largely discontinuous with past evolution. Therefore, these living things did not necessarily evolve through a gradual process of natural selection. Rather, he posited, the process of evolution experiences jumps in complexity, in a qualitative punctuated equilibrium. The emergence of human culture facilitated a quickening of evolution in which cultural evolution occurs more rapidly than biological evolution, consistent with gene-culture co-evolution in the light of human impact on the biosphere.

The idea can be contrasted both with the Gaia hypothesis where the Earth is an organismically responsive dynamical system, if not pushed beyond irreversible tipping points, and utopian concepts of technological human dominance. Rosemary Radford Ruether (1992). in “Gaia & God” has an **insightful commentary** on Chardin later in this work.

Wilson DS (2021), in a supportive review of De Chardin’s ideas, conveyed by Brian Josephson, notes:

He has been largely forgotten by modern evolutionary scientists but remains widely read by those who are inspired by his vision of conscious evolution leading to a planetary superorganism. This working paper examines the major tenets of Teilhard’s vision from a modern evolutionary perspective in an effort to integrate “hard” evolutionary science with conscious efforts to manage cultural change.

In fact Teilhard was a panpsychist and saw consciousness as emergent in all the universe in a manner completely confluent with Symbiotic Existential Cosmology:

The apparent restriction of the phenomenon of consciousness to higher forms of life has long served science as an excuse for eliminating it from its models of the universe. ... It is impossible to deny that, deep within ourselves an 'interior' appears at the heart of beings, as it were seen through a rent. This is enough to ensure that in one degree, or another this 'interior' should obtrude itself as existing everywhere in nature from all time. Since the stuff of the universe has an inner aspect at one point of itself, there is necessarily a double aspect to its structure, that is to say in every region of space and time – in the same way for instance as it is granular: co-extensive with their Without, there is a Within to things.

The consequent picture of the world daunts our imagination but it is in fact the only one acceptable to our reason. Taken at its lowest point particulate matter is more than the swarmings so so marvellously analysed by modern physics. Beneath this mechanical layer we must think of a 'biological' layer that is attenuated to the uttermost, but is absolutely necessary to explain the cosmos in succeeding ages. The within, consciousness and spontaneity – three expressions for the same thing. Here and throughout this book, the term 'consciousness' is taken in its widest sense to indicate every kind of 'psychism' from the most rudimentary forms of interior perception imaginable to the human phenomenon of reflective thought.

Symbiotic Existential Cosmology shares this picture of conscious evolution and it is also precisely the aim of this discussion – to determine to what extent this cosmology and Teilhard’s viewpoint fulfils the ability to engender a sustainable noosphere. Wilson further notes:

The noosphere was not just the increasingly dominant physical presence of humans on earth, but also had a mental component. Teilhard emphasized “the psychic phenomenon of hominization” in the form of freedom of choice, foresight, and the ability to plan and construct. In the Phenomenon of Man, he describes humankind as “evolution becoming conscious of itself”.

Yet gene-culture co-evolution and the notion of emergence of language as a memetic “virus” is a natural sociobiological co-evolutionary process, that is not teleological in the sense that “hominization” implies.

Wilson justifies the qualitative punctuated transition between the biosphere and noosphere in terms of multilevel selection and major evolutionary transitions.

Multilevel selection (MLS) is acknowledged as a legitimate accounting method for evolutionary change. Higher-level selection is a significant evolutionary force in many species and especially in the case of human cultural evolution, as elaborated in more detail below. Social insect colonies and a growing list of other animal societies are studied as superorganisms, complete with social physiologies and groups minds. The concept of Major Evolutionary Transitions (MET) affirms Teilhard’s account of human cultural evolution but also goes beyond it in important ways. The concept follows directly from MLS theory. Most social species are a mosaic of selfish traits that evolve by within-group selection and cooperative traits that evolve by between-group selection. However, the balance between within- and between-group selection is not fixed but can itself evolve. When mechanisms evolve that sufficiently suppress the potential for disruptive within-group selection, between-group selection becomes the dominant evolutionary force and the group becomes so cooperative that it qualifies as a higher-level superorganism.

He then advances a valid argument that cultural history has had such sudden transitions due to the rise of dominant powers and wars between them, with new cultures emerging from the conflict zones: *Peter Turchin explains human history as a series of METs in a way that maps nicely onto Teilhard’s account.*

However he then draws a conclusion about the eucaryote symbiosis between bacteria and archaea:

But METs are not restricted to human cultural evolution. The concept originated with the symbiotic cell theory of Lynn Margulis, in which nucleated cells evolve not by small mutational steps from bacterial cells but as cooperative communities of bacterial cells. Even the origin of life might be explained as communities of cooperative molecular reactions.

This is a biologically incorrect extrapolation, which is misleading. Firstly the eucaryote endosymbiosis was in no way in conflict with gradual mutational change, which was essential to arrive at the point where the endo-symbiosis to form

the mitochondria actually occurred and swept aside its precursors in the radiative adaption of newer fitter eucaryote life forms. Secondly it was not just a community of bacteria, but a symbiosis between the two quite disparate and complementary kingdoms of bacteria and archaea, who had diverged before becoming cellular DNA-based organisms. It is manifestly untrue that nucleated cells do not evolve by small mutational steps – they all do – and the only transition of similar significance that has occurred since, is the entry of chloroplasts into the plant kingdom. It is also unclear either of the cells in the transition were nucleated, which is a step that may have arisen through a further symbiosis with a double-membraned DNA virus. Neither the α -proteobacterial cousins of the mitochondria are nucleated, nor are the Asgard cousins of the founding archaean.

The statement also treats the endo-symbiosis as merely an incidence of a major evolutionary change, without recognising symbiosis is the “live-or-die koan” of the anthropocene, not just an incidental example of pro-sociality.

Wilson states that conscious evolution is restricted to humans, an opinion that appears to have no empirical basis and contradicts Darwin’s own insight on animal free-will:

*"To see a puppy playing [one] cannot doubt that they have free-will"
and if "all animals, then an oyster has and a polype." (Darwin ex Smith 1978)*

Hence, Teilhard was wrong to state that coalescing events are restricted to human cultural evolution. That said, the concept of METs in both biological and human cultural evolution fits easily within his overarching evolutionary epistemology and it remains true that conscious evolution is restricted to humans.

In Wilson et al. (2014) it is noted that:

Human evolution increasingly is seen as a major transition, similar to the evolution of eukaryotic cells, multicellular organisms, and eusocial insect colonies (Boehm 1999; Maynard Smith & Szathmary 1995; Sober & Wilson 1998; Wilson 2011a).

It is fair and correct to see human cultural emergence as a major evolutionary transition, but a fair standard of this is the effect it has on the biosphere as a whole. Thus the origin of life and the eucaryote transition are two outstanding examples. Multicellularity is a more gradual transition, with a variety of transitional species still in existence and the major gene systems already present in single celled species. Insect colonies are not a major evolutionary transition of the biosphere as a whole, and the human transition will qualify only if we can bring ourselves into a state of sustainable survival as a species rather than our own extinction coupled with a mass extinction of biodiversity as a whole, so without being unduly pessimistic, as Symbiotic Existential Cosmology stands to resolve this question, the jury remains out on the human evolutionary future.

It is thus true that biogenesis and the eucaryote endo-symbiosis were major evolutionary transitions and that the anthropocene is rapidly becoming another such transition, but as things stand, it will qualify as an evolutionary epoch only if it presents a sustainable paradigm of human co-evolution with the biosphere on cosmological time scales. There is simply no evidence that such a transition to stability is occurring and gene-culture coevolution of itself, whether applied to commerce, science, language or religion remains an unstable short-term process, inadequate to sustain such a transition to long-term sustainability without a symbiotic human world view.

There are two principal difficulties with the concept of the noosphere. Firstly in many of its utopian forms it invokes simply an age of intelligent thought and technological supremacy via a super-computational singularity that becomes a form of culture replacing nature and effectively leaving it in the dust of history, as an intermediate biological stage between geological and mental. While Teilhard envisaged humanity as a manifestation of biological evolution and not the end of it, the notion of the major evolutionary transition actually signals the phase transition of the Anthropocene, in which human impact on climate, habitat and biodiversity has rapidly become unsustainable.

The second difficulty is that it invokes a convergent unification of consciousness as a teleological process, in conflict with the actual realities of both evolutionary and neurodynamic processes operating at the edge of chaos (Teuscher 2022), which is how the natural universe actually works and is in empirical disagreement with what we are culturally experiencing in real time. Yes there are good pro-social patterns in human interaction that we can associate with the original virtue of our founding gatherer-hunter ancestors, as manifest in the references above cited in Wilson et al. (2014). It is these features we do need to tap to ensure a stable future for humanity.

This is cultural evolution at the edge of chaos, not the neat, simplistic, teleological convergence to “Christ consciousness” originally conceived. This invokes all the complexities of strategic deceit and Machiavellian intelligence exponentiated in a manner that makes verifiable trust a major challenge to incorporate, let alone to achieve spontaneous, autonomous psychic unity without oppressive uniformity. Yes it is compensated for by a hugely enhanced capacity to use these interconnected facilities to research and unearth the ‘truth’, that have become singularly powerful, as this research work attests, but the conclusion remains clear.

Darwin’s position on teleology remained ambiguous. Lennox (1993) notes that he did occasionally mention final cause explicitly, but only in limited contexts, like the two forms of primula flowers where the final cause is already manifest – to favour intercrossing, not a long-distant horizon, like humanity being pre-conceived in the age of the dinosaurs:

The meaning or use of the existence in Primula of the two forms in about equal numbers, with their pollen adapted for reciprocal union, is tolerably plain; namely, to favour the intercrossing of distinct individuals. With plants there are innumerable contrivances for this end; and no one will understand the final cause of the structure of many flowers without attending to this point.

Darwin associated teleology with selection:

It is generally acknowledged that all organic beings have been formed on two great laws - Unity of Type, and the Conditions of Existence On my theory, unity of type is explained by unity of descent. The expression of conditions of existence, so often insisted on by the illustrious Cuvier, is fully embraced by the principle of natural selection.

Darwin speaks of the principle of natural selection "fully embracing" conditions of existence; and Thomas Huxley of a "wider teleology based on the fundamental proposition of Evolution." Asa Gray, on the other hand, read divine design into Darwin's teleology in a way that disturbed Darwin deeply.

The emergence of the internet, and world wide web and the explosion of digital technology has indeed created a cyber space, which at first had all the hope and inspiration of the global village. But we know real world evolution, both biological and cultural occurs at the edge of chaos and with the global village came other spectres – the decline of traditional media, in favour of an ever expanding thicket of disinformation, political subterfuge, false internet identities, hacking, droid armies seeking to purvey trojan horses, and ransomware, amid incipient AI takeover, in which societies and individuals alike, instead of gravitating toward a collective consciousness, have become ever more finely divided, splitting not just political parties, but local communities, families and partners. In the words of the I Ching, “the bed is split up to the skin – misfortune” (Wilhelm ed 1960 Splitting apart line 4).

Without the inclusion of human symbiosis with the diversity of life as a whole, in gene-culture-biosphere co-evolution the entire concept of the noosphere or “thought-sphere”, as it actually is, runs the direct risk, like any other utopian vision, of human intellectual dominance in the technological era, or even the loss of manifest conscious reality in favour of it-from-bit abstractions of reality, not actually manifest in conscious experience itself, simply providing a fast track to a Fermi paradox extinction, through unremitting short-term instability, ungrounded to the evolutionary diversity of life in cosmological time scales – the Medea hypothesis (Ward 2009).

By comparison with Symbiotic Existential Cosmology, Teilhard’s concept appears in its simplicity to be a more efficient transformational vision that looks more direct and more fulfilling in its immediate teleological convergence to a state of unmitigated grace. But the key to locking in this prospect is cosmological symbiosis with the long-term evolutionary and cosmological process that underpins the entire manifestation, not leaving it behind in an ever accelerating process of human cultural transformation that assumes that the biosphere will look after itself, without alleviating the human impacts this very process of cultural change is causing. Teilhard argued that the Omega Point resembles the Christian Logos, namely Christ, who draws all things into himself, who in the words of the Nicene Creed, is "God from God", "Light from Light", "True God from true God", and "through him all things were made". In the Book of Revelation, Christ describes himself thrice as "the Alpha and the Omega, the beginning and the end"

Tipler, along with co-author physicist John D. Barrow, defined the "final anthropic principle" (FAP) in their 1986 book *The Anthropic Cosmological Principle* as a generalisation of the anthropic principle: Intelligent information-processing must come into existence in the Universe, and, once it comes into existence, will never die out. One paraphrasing of

| | For Promoting Teleology | For Undermining Teleology |
|----------------|-------------------------|---------------------------------------|
| Darwin Praised | Gray | Huxley Helmholtz duBois-Reymond |
| Darwin Blamed | Kölliker | von Baer |

Tipler's argument for FAP runs as follows: For the universe to physically exist, it must contain living observers. Our universe obviously exists. There must be an "Omega Point" that sustains life forever.

The trouble with the spiritual viewpoint is twofold. Firstly as we have seen, it carries the distorting weight of religious memes. But secondly it looks to the end point rather than the living process. In the hurtling rush to divinity, all eyes point to the sky and forget that the journey is the destination. The psychedelic view is that the destination is the journey. It is the trip mortality takes across the Styx, deeply aware of its eternal psyche, and its immortal link in the web of life, making best use of the fleeting time available to do that good thing in the best of all possible worlds.

Symbiotic Existential Cosmology also looks to this future of grand unification, but neither as a Christological parousia, which memeticists will immediately recognise as the nemesis of cosmological truth, nor as a simple annihilating final observer as Tipler invokes, but a long experiential journey of discovery into the abysmal depths of conscious experience, in full fecundity of spontaneity, over millions and billions of years, if we take due care of the long-term survival of life, enabling the conscious universe to fully realise itself through the biota it took most of its lifetime to manifest. In this way the journey to Omega is a very long deepening unfolding – the extraordinary vision quest of all our lifetimes, eternally strung from alpha to Omega in the process, amid the reflowering of the diversity of life anew in evolution into forms unconceivable in the simplicity of the Omega point as an eschatological singularity. This is Paradise on the Cosmic Equator in Space Time, where all the good things come to pass!

Not only is the journey long, but the cosmic mind is realised and manifest through the evolving biota of the universe, because we are the conscious beings fully embodied in the quantum universe through our brains. The evolving conscious brain-minds of the biota form the natural interface for the cosmic mind to become fully manifest in the universe. Omega is a state of being, not an endpoint, it is the heightening conscious process extending through space-time, not the end point of time, as in eschatological cosmologies and the Noosphere Christology. The flaw of the eschatological view is that history and experience are consumed, and natural life is abandoned in the pursuit of Omega.

Religions, particularly Monotheism, but also the Eastern traditions to a degree, are obsessed with the eschatological singularity of the Godhead, of Brahman, of eternal life in maha-samadhi now, of the day of Judgment, of the new Jerusalem achieved by the triage and destruction of all life, to be moulded anew by God the creator, the legislator of laws like Sharia and of compulsive moral commandments like not to take the name of the Lord in vain.

The Phenomenon of Man, Revised: Evolution and I.T. versus Extinction in the years to come

Paul Werbos (2019) invokes a radical revision of Chardin's theory, claiming to change it in the light of our state of knowledge, concerning natural selection, intelligent systems, and dark matter, also driven by concern about the future survival of our species, just as Symbiotic Existential Cosmology is. The difficulty is that it stems from three assumptions, each of which are hypothetical (1) that natural selection is inadequate to address humanity's propensity for Fermi extinction, when the actual problem is culturally driven, accentuated by the patriarchy (2) consciousness is conflated with "intelligent systems" which may be either artificial or biological and (3) the notion splits physical reality between quantum electrodynamics and the living biosphere against the hypothetical notion of dark matter, as soul or spirit:

This paper presents the noosphere species theory -- a radical revision of de Chardin's theory, as is necessary to account for what we now know about natural selection, about the mathematics of intelligent systems and about the great ocean of dark matter and energy connecting the galaxies of our cosmos. The noosphere species theory still emphasizes the possibility and need for a growth in spiritual collective intelligence, but it offers more details on how this growth could be supported and accelerated, and it faces up to the reality that our particular noosphere might or might not survive the difficult challenges arising now. And yet, it accepts that we are not alone.

He critiques Chardin's failure to offer a scientific basis for spiritual energy, and asserts that science and particularly quantum electrodynamics cannot explain spiritual experiences. This is trading a critique of the entire functional scope of biological evolution up to conscious life, against a hypothetical notion that dark matter, which we don't know the basis of and which interacts with normal matter only by gravitation is actually a spiritual force intrinsic to conscious existence. If this were the case why hasn't it manifested itself in obvious ways, other than claims of psi and qi, and what implications does it have for a cosmic order potentially dictating the entire course of cosmic history?

The first problem with de Chardin's formulation is that he does not offer a possible physical scientific basis for the flow of spiritual energy (like charisma, qi, mana) which is central to all authentic spiritual traditions around the world, even though he wrote about his deep personal acquaintance with that energy. What mainstream science really knows about the atoms which make up our

bodies, and the quantum electrodynamics (QED) which describes most of their interactions, simply cannot explain anything like the spiritual experiences common to all major cultures on earth or even that small subset verified in the laboratory.

But this problem is about all of subjective conscious experience, as Symbiotic Existential Cosmology makes clear, not just spiritual charisma, psi or qi. He follows this with the assertion that, no matter the physical basis of dark matter, particulate, or otherwise, that it IS the Aristotelean substance underlying consciousness and higher "spirit":

We may debate whether dark matter is made up of fields, or of particles, or of a mix of the two, but in any case it is what Aristotle would call the "substance" underlying higher forms like spirit, and all aspects of mind or consciousness which do not use atoms as their substance.

He then predicts that the noosphere is an "organism" of pure intelligence, with body, brain and immunity:

The noosphere species theory clearly does not guarantee that the human species or any part or product of the human species will survive the challenges of this century, as they play out over the next few thousand years. It predicts that the noosphere has a "body, brain and immune system" (among others) which will play an important role, which are the product of billions of years of evolution making them far more helpful than random chance, but that does not provide a guarantee. ... Are noospheres like fish or like bonobos, who have a better chance of survival? We don't know, but we do know that we face very severe risks as a species, and we know that soul is only one of the underlying forces which will shape our destiny.

He targets four key existential threats to our species, but considers that "mundane" natural selection is insufficient to the task of avoiding extinction by at least one. This is in conflict with the fact that the acute vagaries of the existential crisis facing the planet and our biosphere are culturally, not naturally propelled and remain fully within our capacity as a biological species to address if we simply accept the existential threats as primary priorities to resolve. The use of "mundane" echoes Buddhist pessimism towards everyday existence, as an inferior realm of mortal suffering:

I believe that the biggest four threats now, in order, are: (1) nuclear war and misuse of nuclear technology in general; (2) extinction due to future release of H₂S from the oceans, due to climate change; (3) misuse of biotechnology; and (4) the "Terminator" scenario for AI, which could happen in many different ways if my own work in that field is misused by people who do not understand the underlying principles. ... Unfortunately, the normal process of evolution by mundane natural selection on earth suggests relatively little hope that humans could avoid extinction by at least one of these four mechanisms. Ecosystems which seem relatively stable, after billions of years of world-spanning species being deleted, normally go unstable when large, random changes are made in the relations between organisms.

Research by Sally Quinn of Census and research by the World Bank got much deeper into the drivers of fertility, and found that population growth in advanced nations in recent years was slowed, not by rises in income as such, but by four key variables: (1) women's empowerment and education; (2) availability of public health, especially the whole range of family planning; (3) urbanization; and (4) cultures which do not force women to have children. ... These efforts can be of great value to reduce instability in the next few centuries, but natural selection is still very much at work. ... Some aspects of genetic selection require millions of years to have any effect, but it is well known that a mere 7 to 10 generations are enough to cause massive changes in the mix of genes already "well known" to biology; genes related to sexual behavior and aggression are certainly among those genes.

He then treats the noosphere as a "willing agent", like a God, a dark nature spirit, or a higher level intelligence, similar to Hoyles "Black Cloud" (1957) that can be channeled, or appealed to, but claims this requires collective intelligence we currently lack, both spiritual and "mundane", which seems to encompass physical, biological and everyday reality:

To the extent that we try to channel the will of the noosphere, the challenge is to provide societies which really support a high level of collective intelligence and personal spiritual growth, which requires a high level of education, diversity, freedom and dialogue. It requires designing both formal and informal education and research systems in a way which fully incorporates these bottom line values. Given the great and growing power of the noosphere, those of us who do not choose to work with it may encounter many strange surprises and unnecessary difficulties, as in any bad alchemical marriage. A higher level of collective intelligence, both spiritual and mundane, would be essential to improving our chances of rising with all the threats to existence of the human species.

He cites the information tech and internet revolution as a means to create a new world order through an advanced social contract, while automated artificial intelligence systems take over the functional activity of the economy:

We are now at the early stages of a massive growth in the use of Information Technology (IT); unless there is some kind of massive war and return to dark ages (which itself would raise our chances of extinction and impede spiritual growth), we need to plan for a world in which all flows of money, all corporations and many other activities will be redefined as files in the emerging global Internet of Things (IOT). This redefines the nature of what it means to create a new, viable social contract for nations and for the world. ... Manifestos for a human-friendly internet have started to appear, but unless we do the hard work of translating them into actual system specifications for the emerging foundations of hardware and software, it will all be like the pious words one often hears before an organization starts creating a disaster. The enemy here is a kind of entropy, which can only be overcome by a maximum

use of consciousness and intelligence in concrete, mathematically grounded design implementing very basic mathematical, ethical and spiritual principles.

The noosphere then becomes a model of a dark matter ecology spanning the galaxies, in which some have become space-age noospheric brains, suggesting that they may even have been the source of the ten commandments and the US Constitution and that a new social contract will be implemented by artificial intelligence:

As a general matter, I doubt that the earth is the first planet in this universe to reach this adolescent stage of its development, when its survival is at risk. I would expect that noospheres which have survived in this cosmos have strongly developed "brains," which support intelligence and mind, and "immune systems," which encourage the kind of social contracts and rules which make it possible to survive difficult times like ours. Could it be that the "Ten Commandments" were the best social contract or covenant which could be communicated to foster such things, and to foster intellectual growth, at the early time when they appeared? ... Could we be entering a new era, when a more sophisticated Gen 3 social contract, implemented in advanced IT, is essential to survival through the next phase of our growth?

Werbos then interprets our psyches as Jekyll and Hyde characters of good and evil and suggests only the "angelic" part associated with "soul" and "dark matter" survives death while our bodies, decay as part of the "infernal" realm:

I interpret the manifesto of Akhnaton declaring the sun as the One God as an attempt to channel the nervous system part of the Sol noosphere, the vast neural network in which our personal "souls," our common ideas and archetypes all reside as subsystems. A key aspect of this theory is that we humans are what Dante called "half beast, half angel" – a symbiotic life form, such that part of us is the system of atoms which science now understands far better than most people know, and part is dark matter. It is also what Rosicrucians have called an "Alchemical marriage." Some marriages are good, and some are dysfunctional. Another aspect is that there exists more mature life and mind beyond our solar system, "in the heavens".

In the remainder of this paper, I will use the term "soul" to refer to the "angel" side of us, that part of us made primarily of dark matter, a part of the noosphere. Section 2 of this paper will give my own personal views on what this means in practical terms for us as humans, either as individuals or as agents in history. ... The noosphere species model essentially predicts that when we die the Alchemical marriage also ends, leaving one part alive but only one part. What is the destiny of that part? ...

Some mystics claim that the answer to that question varies a lot from person to person, depending on what they level of development they have achieved in their lifetime. The noosphere species model basically predicts that this is true. More precisely, it predicts that our lifetime and training will lead us towards a fate like the left side of figure 2, or the right side, or a mix, depending on what we learn as a whole system of brain and soul.

This "alchemical marriage" is not symbiosis in any biological form, which requires each party to be in a beneficial relationship to maintain evolutionary stability. The notion of the noosphere is then invoked as a "cosmic computer" involving "back-propagation" that is somehow is construed to evoke psychic phenomena and qi:

First, I have found that the noosphere species concept does more than just justify the idea of psi and soul at an abstract level. The idea that the "brain" of the noosphere is governed by the same universal mathematical laws which apply to any intelligent system turns out to be very useful in finding order in an otherwise very chaotic and diverse ocean of information. For example, if we accept that growth and adaptation of the noosphere brain is governed by modulated back-propagation, just like higher biological and computer intelligent systems, and we recognize that the word "qi" is simply a subjective way of talking about the (several types) of modulated back-propagation operating in the noosphere, we can more easily adapt to the reality that we are a part but not the rulers of an extremely large and intelligent system.

Mystical experience is cited, but only in terms of our demise and the context of astral planes, rather than knowing primary ultimate reality:

Some mystics claim that the answer to that question [of life after death] varies a lot from person to person, depending on what they level of development they have achieved in their lifetime. The noosphere species model basically predicts that this is true. More precisely, it predicts that our lifetime and training will lead us towards a fate like the left side of the above figure [the day of the dead], or the right side [a leafless tree], or a mix, depending on what we learn as a whole system of brain and soul. ... Many mystics talks about "planes of existence," like travel to astral planes and so on. The noosphere species theory would interpret these important and valid experiences as experiences in a realm less real than our mundane world of atoms, experiences in something like an internet chat room of the noosphere.

Like psychedelic experience, higher states of meditations and qi are assumed to involve sensory overload, rather than emptiness or bliss, but these experiences are claimed to simply be information transcending quantum reality:

At a higher level, when we enter into states of "meditation" where we really feel ourselves as part of the noosphere, the vast mind connecting our entire earth or solar system, and respond to the values and feelings and thoughts at that level, we can become channels for that higher qi, which will continue at least as long as life on earth continues, and perhaps even more. It requires great discipline over time to learn to cope with the resulting "firehose of information". None of this requires accounting for the quantum mechanical aspect of noosphere level intelligence, but once we do, it is somewhat easier and more natural to think of it as an ocean of information across space time and the cosmos rather than a firehose or volatile kaleidoscope.

I don't accept as verifiable, this derogation of the brain and of QED in relation to a "dominant" dark matter "soul":

A key aspect of the noosphere species theory is that the dominant partner in the brain-soul interface is the soul or dark matter side. Thus in attempts to connect traces of psi with data like brain recordings, we should not expect to find anything like a psychic reception or transmission organ in the brain or the peripheral nervous system.

Communicating in 2023, Paul has steadfastly maintained his viewpoint:

I have expressed uncertainty and ignorance about many, many things. When my wife asks what I am most certain of, in these realms, different from conventional wisdom, I point to two things:

- (1) That we humans (and some others) are deeply connected as parts of a larger living system, our local noosphere, which is made more of dark matter than of ordinary familiar "QED matter".*
- (2) That qi is real, and essential in many ways to our future, also based on dark matter.*

The whole issue of HOW we humans could make a quantum jump in our level and quality of connection to our local noosphere (and to the Spirit of the Deep, to whatever extent we can make real)... that's big. ... What can the great intelligence of our own noosphere contribute to giving us some hope where otherwise there might be none? ... If so, how can we work with that intelligence to improve the odds both for us and for her/him/it? ... The reality of time, and of "macroscopic Schrodinger cats", is an important and inescapable aspect of our relation with our noosphere.

But what if the collective consciousness is itself unstable because of unresolved conflicts? This is not just a rhetorical game. I really seriously believe that the ideas developed by Freud and Jung for understanding and helping with deep internal schisms apply to our entire noosphere as well... to what Jung called "the spirit of the times." (I give thanks again to the person I bcc who pointed me to Jung's Red Book.) The deep schism between oversimplified narrow versions both of science and of "religion" is one very important example. Our entire noosphere is like an adolescent going through growth pains and stresses which might well kill.. her? him? it? ... I hope that many of you share my conclusion that human potential includes brain, body AND "soul" (referring to capabilities and life beyond what is visible with QED physics), and that greater development of human potential is urgently needed now to give us a chance of surviving as a species in the face of new challenges which could kill us all before the end of this century.

Grand Challenges This Century – Quantum leap in attaining human potential, including our connections to each other & our noosphere (soul, qi) the rise and fall of civilizations clearly and visibly reflects the interaction of several key input variables, including money (as Marx rightly observed but with no understanding of modern production functions), DNA, and the role of our inputs and outputs to and from our noosphere, the larger system of life and intelligence embodying our entire solar system.

I regret my earlier error in underestimating the importance of quantum intelligence in understanding what our noosphere is doing and what it is capable of, and how we can best improve our relations with it. It is not omnipotent, but the power of changing scenarios is very great. ... Recent world events (see my usual fears, still in play) have led me to compare the entire noosphere of our solar system -- all of us, our souls and other creatures like us -- to a small fish in a big aquarium, which will probably not survive -- but should STILL give full rein to our(its) primary deepest impulses -- to survive (as a noosphere, as all of us together), to grow and to understand our environment.

Here I really find the concept of a patent claim connected with "AGI which achieves a level of consciousness beyond what any mammal brain possesses" to be a diabolical over-reach into the realms of Dr. Strangelove, but here is is all conscious biological life in the firing line, not just the Soviet Union:

*THE NEXT REALLY BIG STEP FORWARD in technology, and in building AGI which achieves a level of consciousness beyond what any mammal brain possesses, is even more basic than MQED0. CaQED used **WITH THE OLD" models of wave function collapse, assumed in most of Quantum S&T "QuIST" work today, is already powerful enough to implement all three levels of Quantum AGI as covered in my new patent pending on that area. That physics might be called CaQED0.*

Needless to say, I find this entire concept to be an imaginative, but contrived leap which teems with unverifiable assumptions and leaves us in a similar position to traditional religions, in which nature is regarded as degenerate in and of itself, and in which there is a struggle between ascendent spirit and an "evil" world of suffering, amid traditional concepts of an individual soul.

I have concerns about forms of spiritual elitism associated with an occluded notion of an intellectual noosphere which cuts the diversity of life out of the redemption loop in favour of a technological utopian worldview. Your [Bangalore](#) paper, mentions four great fears, but lists only three, and fails to mention mass extinction of biospheric diversity as a concern in its own right.

Four Great Fears ("Existential Threats") SURVIVAL:

- *Internet/AGI/IOT if we fail to reach Sustainable Intelligent Internet (SII)*
- *Climate extinction, all of our species and many others*
- *Misuse (1) of nuclear tech (e.g. werbos.com/NATO_terrorism.pdf) and (2) biotech, e.g. "Borg"*

You mention extinction but only associated with climate crisis and focused on humanity's risk. Biodiversity extinction is not just a question of climate, it is also a product of wholesale habitat destruction, pollution, the spread of feral species, genetically destructive monoculture of our essential food and medicinal species, burning of the great forests and the simple fact that the biomass of humans plus farm animals is now some 46 times higher than all wild land mammals put together. This in itself is unsustainable and will kill us in the long term unless we recognise the primacy of protecting the diversity of life as numero uno.

It raises a real concern that your world view is anthropocentric and at the same time seeks to realise forms of artificial intelligence which you seem to believe can also become fully subjectively conscious. Your paper defines the word "consciousness" as "consciousness qua mind", an emergent property of an intelligent system such as a brain or a soul or a new type of intelligent computer system which a few of us now know how to build (Werbos 2022).

Afterthoughts on the Noosphere

Symbiotic Existential Cosmology invokes a very different spectre from The Phenomenon of Man, Revised. Like Chardin's original Phenomenon of Man, it is natural, accepts the sacredness of evolving conscious life and our ability as subjectively conscious sentient beings who are volitional agents able to transform the living universe and protect the immortality of the diversity of life from a human-caused Fermi extinction. Rather than appealing to Gods, or dark forces, it confirms that we as conscious agents not Gods or spirits are transformative of reality; it extolls the resplendence of natural enlightenment achieved through entheogenic meditation, freeing each and every one of us from the travail of the mortal coil and sees psychic powers as simple manifestations of the sensitive mystical condition, rather than a superficial end in itself. We are (hopefully) mid-flight on a conscious evolutionary journey with a vast living future to experience. If we learn to undertake this journey without immediate climatic crisis, biodiversity extinction or nuclear self-destruct, we could/should have another billion years to unfold the deepest dimensions of the conscious condition in us or in another progenitor species in fulfilling the flowering of the conscious universe and enabling the mind at large to really come alive in us and in all life.

Human hubris keeps gravitating, either to technological or spiritual Utopias, in which experience just becomes information, or God's will, and survival just becomes an algorithm, or religious accounts, in which humanity has dominion over nature, as God has dominion over us, and seeks union with God, at the expense of our incarnate responsibility to participate in the flowering of conscious life throughout the universe over vast cosmological episodes, all of which are there for us to experience and realise over these vast stretches of time spanning space-time itself, if we bring forth what we have within us, rather than seek a short quick route to annihilation. The lesson of the snowflake is that the omega point end product is death of the growth process. Yes each whole beautiful flake grew and became eternal in space-time as a whole, but the journey IS the destination, so the destination IS the journey, not the end.

If we pass off the awe and wonder of existence, as it has already come to pass in enabling humanity to evolve and life with us, to ask the existential questions we do, and for us to experience the scent of a flower, the shimmering rainbows off a butterfly's scales, the singing of the crickets in the moonlit grass, and the ecstatic joys of sex – to know that we know that we know that we are aware that we are aware, and to dream, and to have entheogenic visions, then we should settle for paradise on the cosmic equator and live our transient mortal lives in symbiosis with the totality of existence, because everything we do for life as a whole will further and flower, but nothing else shall, or can. No utopian pretence of technological dominion in the age of thought, no religious pretence of the will of God – just I/ we ourselves bearing witness to the truth of existence and the un-utterable gift this is, even in times of great pain and torment, traversing the Styx between birth and death at the centre of the cyclone, in the best of all possible worlds. If we stuff this up, as we so easily could, that will be it for life, the universe and everything – God included, unless there is conscious life elsewhere, which we don't yet know. We are the interface of the cosmos – that's what conscious mortality is. Without conscious life, neither God nor the Universe can manifest. The Godhead is realised through the biota. We are sorely needed, we are the pivot. Life IS the Axis Mundi, not a disposable option along the way.

2 Animism, Religion, Sacrament and Cosmology

The inclusion of agency in Symbiotic Existential Cosmology realises the intimate relationship between panpsychism and animism⁵², which is based centrally on agency, as a manifestation of the widespread perspective held by ethnic cultures and in shamanism, of agency being a feature of all living and perhaps even non-living entities. Animism also holds the key to the Weltanschauung of Immortality that has sustained the human spiritual sense of meaning since our emergence as a cultural species. Animism is the belief that all things – animals, plants, rocks, rivers, weather systems etc. possess a distinct spiritual essence – as animated and alive – extending ultimately to the Gaia hypothesis⁵³ that living systems and the geosphere are in a self-sustaining feedback loop which could be disrupted by tipping points (Lovelock 1972, Lovelock & Margulis 1974). It thus aligns closely with panpsychism and is said to describe the most common, foundational thread of indigenous peoples' "spiritual" or "supernatural" perspectives, especially before organised religion. The Dictionary of the Social Sciences (Gould and Kolb 1965) sums it up as "the belief in the existence of a separable "soul-entity", complementary to the physical and biological "embodiment" of a living individual or material organism." Modern society still treats certain phenomena, from hurricanes to boats, which are often given a female figurehead as a historical protection against misfortune at sea and are generally given names as agents.

Several of these natural entities take the form of edge-of-chaos processes, such as wind, waterfalls and storms from turbulent mountain summits to the ocean, which from the point of view of symbiotic panpsychism are strong candidates for coherent subjectivity.

"In the earliest times, when both people and animals lived on earth, a person could become an animal if he wanted to, and an animal could become a human being. Sometimes they were people and sometimes animals and there was no difference. All spoke the same language. That was the time when words were like magic" – Nalungiaq, Netsilik woman storyteller (Rothenberg 1972: 45)

In addition to a span of cultures, from Amazonian to migratory African peoples who escaped slavery in India, I shall focus on two founding human peoples, the Pygmies of the Congo Basin Forests and the Bushmen of the Kalahari desert and surrounding more fertile regions, both of which have consistent cultures running back for tens to hundreds of millennia, originally comprising the main populations of southern sub-Saharan Africa. Both of these cultures manifest both animism and gatherer-hunter symbiosis with the natural environment pivotal to humanity's survival over evolutionary time-scales. The San Bushmen have an extremely long-standing cultural and genetic history running back to the mitochondrial African Eve, over 150,000 years, with cultural evidence dating back over 100,000 years. Likewise pygmies have had a largely unchanging culture for referred to by the Egyptians 4000 years ago as "the people of the trees".

Animistic beliefs are also confluent with the use of entheogenic and psychotropic sacraments, as evidenced by the San Bushmen's use of cannabis and experience of the trance dance and the cultivation the use of Tabernanthe iboga among the Biaka Pygmies and the use of ayahuasca by the Shipibo and peyote by the Huichol.

Magical Consciousness, Animism and Human Psychic Unity

J D Lewis-Williams (2013) notes the enigmatic lines running through San rock art that have an unforeseen cosmological significance connecting the visionary worlds:

Across southern Africa from the Drakensberg in the east to the Cederberg in the west there are painted lines that

⁵² *animism* (Latin: anima, 'breath, spirit, life')

⁵³ It is empirically true that global heating "punishes" humanity in clear functional terms, but not as a moral punishment in the religious sense. Gaia may even have full agency in a sense we don't yet appreciate. "Why not?", as physicist Brian Josephson commented to me citing James Lovelock. The question we have to ask is this: Is a tornado less alive than a prokaryote? A prokaryote is tightly controlled as a genetic process and likely not conscious, but a thunder storm is in a sense more alive in the way our brains are dynamically. If alive means primitive subjectivity then a thunder storm should be accepted as alive in that sense. Any physical system capable of unstable autonomous dynamics is a candidate. Attributing agency in this way might have a deeper basis in consciousness understanding quantum reality from personal experience. What kind of form tornado or Gaia secret life might take is no easier to estimate than the putative "free will" of a quantum. But it IS an empirical question!

meander through densely constructed panels, entering and leaving human and animal depictions, bifurcating and weaving in and out of the rock face. Sometimes these lines are fringed with white dots, sometimes they take other forms. ... But the northern ethnographies hold the explanation. The Kalahari San speak of “threads of light” that come down from the sky and take trancing shamans (n/omkxaosi) up to visit god and his vast herds of animals. Shamans, who are the only people who can see these “threads,” climb them as if they were ropes or walk along them as if they were paths. They also simply glide just above the “threads.” All these various manifestations are clearly depicted in the southern African rock art. Moreover, those lines that seem to penetrate the rock face (as do other images) lead to the spirit realm that was believed to lie behind the “veil.”

Fig 163: The painted line on San Rock art at Drakensberg seems accidental but has huge spiritual significance (Witelson et al. 2021).

Elaborating on his theme, he cites in three points, the need to understand the evolution of consciousness, including alternative states, as well as the evolution of intelligence in human societies:

First, the evolution of “modern human behavior” (a difficult concept) depended as much on the evolution of consciousness as on intelligence. By focusing on intelligence and ignoring consciousness researchers have missed a fundamental human characteristic—the ability to conceive of alternative realities. Second, all religions are founded on shifting consciousness and the alteration of consciousness by meditation, rhythmic movement, sensory deprivation, psychotropic substances, and many other means. Third, religion is not a peripheral “add-on.” It is intimately involved in social change.

In “Magical Consciousness: An Anthropological and Neurobiological Approach”, Susan Greenwood and Erik Goodwyn (2015) delineate the contrasting relationship between the neuroscientific implications of analytical thought for our understanding of consciousness and the deeper mythopoetic, analogical and creative existential views generated by the “magical thinking” of animism. Citing Lewis-Williams (2013) they note the contrast between these two modes:

More than 20,000 years ago, prehistoric humans in southern Africa painted lines on cave walls, bringing them to life with images of humans and animals. Neuropsychological studies of altered states of consciousness suggest that these marks might be indications or recordings of certain kinds of brain activity, but when asked for an explanation, some contemporary Kalahari San people explain them as “threads of light” from the sky to take shamans ... while in trance to visit god and his vast herd of animals. One explanation of the cave art is based on materialistic neurobiology, whereas the other relies on indigenous “magical” meanings, such as those studied by anthropologists. If each explanation for the prehistoric painted lines is seen as plausible, then we need some form of incorporating these very different interpretations. The issue is to find a basis for a common ground.

They see analogical thinking as inherently animistic in nature:

The practical application of analogical reason as opposed to logical reason) is inherent within the notion of participating in an interrelated, inspired world best described as “animistic.” Animism is a relational psychic ontology found cross-culturally. Magical thinking is predominantly animistic; indeed, magical consciousness could be said to be animist thinking in action. On a vernacular or everyday level, many societies can be said to operate within a generalised animist perspective, one that views positive and destructive powers pervading the universe, particularly focussed on specific places and things.’ Animist perspectives most likely co-exist with the major religious traditions of Hinduism, Buddhism, Judaism, Christianity, and Islam — particularly in non-Western locations. Such animist world views rely on a relational magical ontology that denies categorising “the inner” (what we might call the psychological) and -the outer” (a social or cultural context) in any dualistic fashion. Animism is also gaining popularity as an advocacy for a certain relational, ecological worldview.

They suggest such analogical thinking has been the basis for a common sense of “psychic unity” across evolving human cultures: *The nineteenth-century German ethnologist Adolf Bastian first coined the term “psychic unity” to express the conviction that all human beings shared the same basic mental framework; this indicated a species-wide similarity in mental reasoning capabilities. Indeed, mitochondrial DNA evidence suggests that for 200,000 years, all humans have essentially shared the same bloodline, and many scholars are “beginning to concede the existence of a core human psyche”.*

Greenwood & Goodwyn’s view from magical thinking presents a completely counterposed position to that of rational materialism, in relation to the hard problem of consciousness:

In magical thought, we begin with the non-material domain of spirits and/or minds, and matter becomes the odd thing that needs explanation! In an animistic perspective, spirits do not require understanding in terms of physical facts, and they are not felt to “derive” from physical, “naturalistic” (which usually means mechanical) laws. ... On the contrary, within an animistic worldview, the exact opposite is true: the physical world is derived from the action of non-physical, consciously experiencing spirit beings; the world is full of spirits or minds pervading everything. Causality itself is different: things do not cause other things, but within an animistic orientation, spirits or minds cause things to happen through their intent. ... From an animistic perspective, minds do not require explanation in terms of physical facts, and minds are not felt to “derive” from physical, “naturalistic” (which usually means mechanical) laws. On the contrary, under an animistic worldview, the exact opposite is true; the physical world is derived from the action of non-physical, consciously experiencing minds, and the world is full of minds pervading everything.

Animism also confirms a cosmological viewpoint accepting the veridical truth that the physical world is manifest through subjective consciousness, although it may be somewhat indiscriminate in attributing agency to entities which do not. Broadly speaking however in the natural world of the gatherer-hunter the “lion’s share” of intervening risks to survival or health are from active agents, whether human enemies, parasites, predators, or unstable natural phenomena such as storms and floods. It is only in technological society, where the majority of intervening events can often be mechanical that this begins to appear naive or silly. Even so, ships have been traditionally crowned by a female figurehead as a guardian of the waves and a favourite vehicle is often patted and treated as a living being:

This essentially animistic worldview looks at the minds responsible for the physical world, not only those minds mysteriously associated with other humans and animals, but the minds behind other chaotic, self-motivated, and typically unpredictable phenomena, including the day-to-day events in one’s life and the very motions of the universe itself. For animism, the world is full of non-physical minds that act according not to the mechanical laws of physical causation, but by the mental laws of motivation, intention, desire, and emotion.

The animist point of view causes the hard problem of consciousness to evaporate:

Responding to the hard problem of consciousness, the animist and magical thinker would say there is no hard problem, because minds are not created by matter. Rather, minds are primary and explain the phenomena of the physical world, perhaps creating matter itself during the acts) of creation. To exclude the mind from the explanation because of an adherence to such axioms as the causal closure of the physical world (a popular axiom in physical science and philosophy that posits only efficient causation and denies final causation) is therefore to eliminate the mind from the equation as - causally irrelevant”.

They also bring up a core issue that is ignored by analytical materialism. There are always two ways of looking at an intervening event such as a disease or accident, the contextual (physical or biological) causes and the exact specific train of coincidences that brought this idiosyncratic event onto being. This is also a fundamental characteristic of the quantum universe stemming from quantum uncertainty. Covid is a perilous disease so we can try to vaccinate ourselves to address the contextual risks but this does not protect us from freak occurrences by being in the wrong place at the wrong time e.g. in an unanticipated super-spreading event, so it is as relevant to ask what caused me to catch this now? For this reason anthropologists acknowledge that an animistic viewpoint has unique survival value because it does protect from unpredictable threats from intentional agents, even though it may result in overkill on attributing physical causes to conscious agency because everything is treated as alive:

The classic example of this dichotomy is in Evans-Pritchard’s description of the Zande rationale for the granary collapse: the Zande knew full well that the granary collapse was “caused” by termites eroding the foundational structures. This physical explanation was, however (in converse to the Western philosophical viewpoint) - causally irrelevant” to their inquiry, which was, “Which mind intended for the granary to collapse at just this moment?” ... The Zande might not care about universal gravitation or termite biology, they want to know who made the granary collapse at just the moment a friend was under it.

They arrive at a compromise position proposing dual-aspect monism in almost identical form to symbiotic existential cosmology:

One solution is dual-aspect monism: that is, that the mind and matter are both properties of a single monistic substance that is not directly observable; when viewed under “objective” circumstances it looks like the brain, and when viewed -subjectively,” it looks like

the mind- From this view, the mind is not seen as deriving from matter, but is rather proposed to be another property of matter (or vice versa).

Is Polyphasic Consciousness Necessary for Global Survival?

In "Is Polyphasic Consciousness Necessary for Global Survival", Tara Water Lumpkin (2001) invokes the urgent need to reinstate polyphasic consciousness, enlarging analytical reasoning responsible for its monoclonal destructiveness on human society, to the full breadth and depth of human conscious awareness and biodiversity as a whole:

To perceive is to become aware. Human perception is created by the interaction of human biology, the physical environment, an individual's personal development, and a person's culture (Lazlo and Krippner 1998:65). Perception is a complex, synergistic system, with numerous feedback loops, allowing for the generation of meaning and subsequent communication of that meaning. Perception evolves and changes as an individual, culture, or environment changes.

She makes clear that perceptual diversity is a long standing intrinsic part of human consciousness which is increasingly under risk:

A growing number of psychologists and anthropologists have become interested in the value of perceptual diversity, seeing the use of multiple perceptual processes as positive rather than pathological. Anthropologist Charles Laughlin has proposed that cultures are "monophasic" or "polyphasic" (1992). Polyphasic cultures value perceptual processes that use altered states of consciousness, such as dreaming, lucid dreaming, contemplation, ecstatic and trance states, as well as ordinary, waking consciousness (Walsh 1993:125). Roland Fischer presents a model of altered states of consciousness based on neurophysiology (1970a; 1970b). According to Fischer, states of consciousness are based along a continuum of arousal of the central nervous system. States of reduced central nervous system arousal (or hypoaarousal) are represented by tranquil meditation or the Yogic state of samadhi. States of increased arousal (or hyperarousal) are represented by sensitivity, creativity, anxiety, ecstasy, and mystical rapture.

She notes, as a founding example, !Kung trance dancing, which we shall discuss in detail later with the San:

The Kalahari Kung in Botswana are an example of a polyphasic culture. Anthropologist and clinical psychologist Richard Katz lived with them in the 1970s and documented that one-third of all adult Kung "routinely and without drugs altered their state of consciousness, thereby releasing healing energy to the entire community" (1982:3). Katz defines states of consciousness as "patterns of human experience, which include ways of acting, thinking, perceiving, and feeling." And he defines an altered state of consciousness as being "radically different from the usual everyday patterns" (1982:3). When the Kung were camped at a permanent watering hole, they conducted their communal, all-night healing dances as often as twice a week. If camped in the bush, the dances occurred only two to three times per month (1982:37). Katz noted that the healers had rich fantasy lives, which he pointed out were another type of altered state of consciousness. And, according to Katz, the Kung healing process demanded intuition and emotion rather than logic and rationalism, meaning such processes were valued in creating the Kung cultural, cognitive map (1982:236).

The risk to perceptual diversity and its alternative experiential states has dire consequences also for social, cultural, and cognitive survival and the survival of the diversity of life and the human species:

Perceptual diversity allows human beings to access knowledge through a variety of perceptual processes, rather than merely through everyday, waking reality. Many of these perceptual processes are transrational (meditation, trance, dreams, imagination) and are not considered by science (which is based primarily upon quantification, reductionism, and the experimental method) to be valid. In the past, perceptual diversity was valued by a majority of cultures. Now it is being devalued and replaced by the monophasic culture of "developed" nations. Just as we are losing (1) biodiversity (or biocomplexity) in the environment and (2) cultural diversity among societies, we also are losing (3) perceptual diversity among human cognitive processes. All three losses of diversity (bio, cultural, and cognitive) are inter-related.

Loss of perceptual diversity disables the polyphasic map of existence that has enabled people throughout history to navigate their lives in a way conducive to their continued survival:

Individuals and cultures create cognitive maps to help them navigate the landscape of socio-cultural and physical environments (Lazlo and Krippner 1998:66). These cognitive maps are used by individuals and cultures to adapt and evolve. The cognitive map of "developed" nations is one of specialization that disavows multiple perceptual processes, whereas the cognitive maps of most "less developed" cultures are more holistic, providing for a multitude of processes with which to access knowledge, including altered states of consciousness.

The ultimate fatal error is the loss of biodiversity:

When societies devalue and lose perceptual diversity, they lose varied ways of accessing knowledge. The loss of perceptual diversity homogenizes societies, reducing cultural diversity. And the loss of cognitive maps that use a variety of perceptual processes,

including altered states of consciousness, results in navigation of physical environments based only upon monophasic consciousness. When humans interact with the environment using only monophasic consciousness (or the scientific method), the end result is that they reduce biodiversity and biocomplexity.

The Grim Ecological Reckoning of History

Ridley (1996) noted that Chief Seattle, leader of the Duwamish Indians, delivered a famous speech to the governor of Washington territory in 1854. The governor had offered to buy the chief's land on behalf of Franklin Pierce' president of the United States. Seattle replied in a long and shaming speech that is now among the most widely quoted texts in all environmental literature. It presages almost every thread in the philosophy of the modern conservation movement. The speech exists in various slightly different versions, one of the most moving being that which Albert Gore quoted in his book *Earth in the Balance*:

How can you buy or sell the sky? The land? The idea is strange to us ... Every part of this earth is sacred to my people. Every shining pine needle every sandy shore, every mist in the dark woods, every meadow, every humming insect. All are holy in the memory and experience of my people ... will you teach your children what we have taught our children? That the earth is our mother? what befalls the earth befalls all the sons of earth. This we know: the earth does not belong to man, man belongs to the earth. All things are connected like the blood that unites us all. Man does not weave the web of life, he is merely a strand in it. Whatever he does to the web, he does to himself.'

However one cannot afford to be naive. Although Ridley highlights the evolution of trust as a core human virtue, The rape of mother Earth and her living diversity has not just been committed by modern technological civilisation, nor by apocalyptic religions alone. Ridley (1996) again notes that history abounds with evidence that the limitations of technology or demand, rather than a culture of self-restraint is what kept tribal people from over-exploiting their environment. Methods of hunting have remained opportunistic, often taking easier prey such as females, sometimes specifically including pregnant ones and seeking the richest hunting grounds.

Ridley notes many examples from the pre-Columbian Americas. The Mayan empire reduced the Yucatan peninsula to scrub and fatally wounded itself. Chaco Canyon was abandoned by the Anasazi before the Spaniards arrived when the extraction of pine timber for their 650 room settlement containing 200,000 huge pine beams removed all the pine trees requiring a 50 mile road to drag pine logs to the increasingly eroded site. At Olsen-Chubbock the Colorado site of ancient bison massacres, where people regularly stampeded herd of a cliff the animals lay in such heaps that only the one on top were butchered and only the best joints were taken from them.

But the initial extinctions on the arrival of humans were even more telling:

Coincident with the first certain arrival of people in North America, 11,500 years ago seventy three percent of the large animal genera quickly died out. Gone were the giant bison, wild horse, short-faced bear, mammoth, mastodon, sabre-toothed cat, giant ground sloth and wild camel. By 8,000 years ago eighty percent of the large mammal genera in South America were also extinct – giant sloths, giant armadillos, giant guanaco, giant capybaras, anteater the size of horses.

Maoris sat down and ate their way through all twelve species of the giant Moa bird (the biggest weighting a quarter of a tin) before turning cannibal in desperation. At one Moa butchering site near Otago, at least 30,000 were killed in a short time – and on average a third of the meat was left to rot, only the best haunches being taken. Entire oven with haunches still in them were left unopened, so abundant was the supply of meat. It was not just moas. Half of New Zealand's land birds are extinct.

It took a little longer to wipe out Australia's large mammals. Yet soon after the arrival of the first people in Australia, possibly 60,000 years ago, a whole guild of large beasts vanished marsupial rhinos, giant diprodons, tree fellers, marsupial lions, five kinds of giant wombat, seven kinds of short faced kangaroos, eight kinds of giant kangaroo, and a 200 kilogram flightless bird.

By contrast he notes that Africa and Eurasia saw no such sudden bursts of extinctions of large mammals and that mammoth hunting persisted for 20,000 year in Eurasia, although extinction still occurred in the end. We shall also see that founding cultures of the Bushmen and Pygmies do practice an ecologically reverent non-exploitation of nature.

Anthropological Assumptions and Coexistential Realities

The idea of animism was developed by Edward Tylor (1871), defining it as "the general doctrine of souls and other spiritual beings in general", noting "an idea of pervading life and will in nature". Georg Ernst Stahl had developed the term *animismus* in 1708 as a biological theory that souls formed the vital principle and that the normal phenomena of life and the abnormal phenomena of disease could be traced to spiritual causes.

Bird-David (2000) notes that Tylor's position was that "animists" understood the world childishly and erroneously, and under the influence of 19th-century evolutionism he read into this cognitive underdevelopment. Tylor argued that in the savage view every man had, in addition to his body, a "ghost-soul," a "thin unsubstantial human image," the "cause of life or thought in the individual it animates," capable "of leaving the body far behind" and "continuing to exist and appear to men after the death of that body" Tylor suggested that modern religion had evolved in stages from animistic beliefs, through which early peoples had tried to explain the world to themselves, and these beliefs had survived into the present and (re)appeared universally among children and "primitive" people and in certain modern cults. In Tylor's view, "it was as though primitive man, in an attempt to create science, had accidentally created religion instead, and had spent the rest of evolutionary time trying to rectify the error".

19th-century anthropologists argued an evolutionist position, that "primitive society" was ordered by kinship and divided into exogamous descent groups related by a series of marriage exchanges. Their religion was animism, the belief that natural species and objects had souls. With the development of private property, the descent groups were displaced by the emergence of the territorial state. These rituals and beliefs eventually evolved over time into the vast array of "developed" religions and the more scientifically advanced a society became, the fewer members of that society believed in animism. Modernism is characterised by a Cartesian subject-object dualism that divides the subjective from the objective, and culture from nature. In the modernist view, animism is the inverse of scientism, and hence is deemed inherently invalid.

Durkheim (1915) in a marginally less derogatory analysis suggested that "primitive peoples" regarded as kin and friends some entities that were animated by them, noting that "primitives" believed that the bonds between them and these natural entities were "like those which unite the members of a single family" : bonds of friendship, interdependence, and shared characteristics and fortunes arguing that they mistook the spiritual unity of the totemic force, which "really" existed, only for a bodily unity of flesh. Anthropology textbooks continue to introduce animism as "the belief that inside ordinary visible, tangible bodies there is normally invisible, normally intangible being: the soul . . . each culture [having] its own distinctive animistic beings and its own specific elaboration of the soul concept" (Harris 1983, 186).

Stewart Guthrie (1993) describes animism as an evolutionary strategy to aid survival – that both humans and other animal species view inanimate objects as potentially alive as a means of being constantly on guard against potential threats: *Scanning the world for what most concerns us — living things and especially humans — we find many apparent cases. Some of these prove illusory. When they do, we are animating (attributing life to the nonliving) or anthropomorphising (attributing human characteristics to the nonhuman)", thus relegating animistic beliefs to "mistakes".*

Animism differs from pantheism, although they are sometimes confused. One of the main differences is that while animists believe everything to be spiritual in nature, they do not necessarily see the spiritual nature of everything in existence as being united, the way pantheists do. As a result, animism puts more emphasis on the uniqueness of each individual soul. In pantheism, everything shares the same spiritual essence, rather than having distinct spirits or souls.

Some postmodern anthropologists theorise that all societies continue to "animate" the world around them. characterised by humanity's "professional subcultures", as in the ability to treat the world as a detached entity within a delimited sphere of activity. Human beings continue to create personal relationships with elements of the aforementioned objective world, such as pets, cars, or teddy-bears, which are recognised as subjects.

In a review of Graham Harvey's "Animism: Respecting the Living World" (2006), Wright (2010) outlines the key features of the "new animism" Harvey espouses:

The 'New Animism' elaborated by Harvey and others proposes that humans participate in a subjective 'pan-spiritism' that involves all living and even—to the Western mind—non-living beings such as stones and the deceased. Furthermore, there is a kind of meta-communication that is possible among beings of different species. This meta-communication consists of different powers of subjectivity and mentality possessed by all species and even spirits of the dead. These powers make possible communication by humans with natural entities independent of human culture. This universal 'pan-spiritism' is as natural as the distinct bodily forms of the different species that share in it. Thus, 'nature' consists of different bodily forms, but 'spirit' (anima) is universal and homogeneous. All beings share in it, despite the differences in bodily forms; and no natural being is excluded from it, that is, no natural being is excluded from participation in the cultural domain with human beings. Spirit is the common denominator of all natural beings.

The new view of animism emerged from Irving Hallowell's (1960) ethnography of the Ojibwa, in which personhood concepts and ecological perception have become two fruitful areas to reevaluate theories of animist practices and beliefs. The Ojibwa sense of personhood, which they attribute to some natural entities, animals, winds, stones, etc. takes the axiomatic split between "human" and "nonhuman" as essential. The Ojibwa conceives of "person" as an overarching category within which "human person", "animal person", "wind person" etc., are subcategories. Echoing Evans-Pritchard's account of Azande magic (1937), Hallowell argues that experience itself does not rule out Ojibwa animistic ideas. On the contrary, experience is consistent with their reading of things, given an animistic viewpoint. This reinforces the view that animism is a functional form of "symbiosis" between culture and nature, in which relationship, rather than individual identity becomes key to the success and survival of a people.

Fig 164: Obtossaway, An Ojibwa Chief (Minnesota c. 1903), Plains Ojibwe performing a snowshoe dance (George Catlin), Ojibwe maiden (1920s colored photo of the Native American lady Of The Great Algonquian Stock).

Cultural ecologist and philosopher David Abram (1996) promotes an ethical and ecological understanding of animism grounded in the phenomenology of sensory experience. In the absence of intervening technologies, he suggests, sensory experience is inherently animistic in that it discloses a material field that is animate and self-organising from the beginning. He suggests that such a relational ontology is in close accord with our spontaneous perceptual experience; it would draw us back to our senses and to the primacy of the sensuous terrain, enjoining a more respectful and ethical relation to the more-than-human community of animals, plants, soils, mountains, waters, and weather-patterns that materially sustains us.

Nurit Bird-David explains that animism is a "relational epistemology" rather than a failure of primitive reasoning. That is, self-identity among animists is based on their relationships with others, rather than any distinctive features of the "self". Instead of focusing on the essentialised, modernist self (the "individual"), persons are viewed as bundles of social relationships ("dividuals"), some of which include "superpersons" (i.e. non-humans).

In her critically oriented comparison of the Melanesian and the Euro-American "person", Strathern (1988) argues that the irreducibility of the individual is a peculiarly modernist notion. It is not everywhere that the individual is regarded as "a single entity", "bounded and integrated, and set contrastingly against other such wholes and against a natural and social backgrounds". The Melanesian "person" is a composite of relationships, a microcosm homologous to society at large. This person objectifies relationships and makes them known. She calls it a "dividual", in contrast with the (Euro-American) "individual".

Bird-David's work centres on the Nyaka of the Karnataka hills in India. These are a group who claim ancestry as slaves taken to India, who cannot recall their exact origins, and who immediately escaped and ran to the mountains, where they have since lived, regarded by surrounding people as siddi or "wise-ones", who have an animistic belief in spirits dwelling in the mountain tops. She notes that their sense of personhood stems from relationships rather than individual identity:

Transcending idiosyncratic, processual, and multiple flows of meanings, the Nayaka sense of the person appears generally to engage not the modernist subject / object split or the objectivist concern with substances but the above-mentioned sense of kinship. The person is sensed as "one whom we share with". It is sensed as a relative and is normally objectified as kin, using a kinship term. Their composite personhood is constitutive of sharing relationships not only with fellow Nayaka but with members of other species in the vicinity. They make their personhood by producing and reproducing sharing relationships with surrounding beings, humans and others. They retain immediate engagement with the natural environment and hold devaru performances even when they make a living by different means such as casual labor. These relationships constitute the particular beings as devaru.

Fig 165: Nyaka enacting devaru

To summarize this point of the argument, the devaru objectify sharing relationships between Nayaka and other beings. A hill devaru, say, objectifies Nayaka relationships with the hill; it makes known the relationships between Nayaka and that hill. Nayaka maintain social relationships with other beings not because, as Tylor holds, they a priori consider them persons. As and when and because they engage in and maintain relationships with other beings, they constitute them as kinds of person: they make them "relatives" by sharing with them and thus make them persons. They do not regard them as persons and subsequently some of them as relatives, as Durkheim maintains. In one basic sense of this complex notion, devaru are relatives in the literal sense of being "that or whom one interrelates with" (not in the reduced modern English sense of humans connected with others by blood or affinity). They are superrelatives who both need and can help Nayaka in extraordinary ways.

"Wherever there are Nayaka, there are also devaru, for Nayaka want to have them and always find them". (Karriyen)

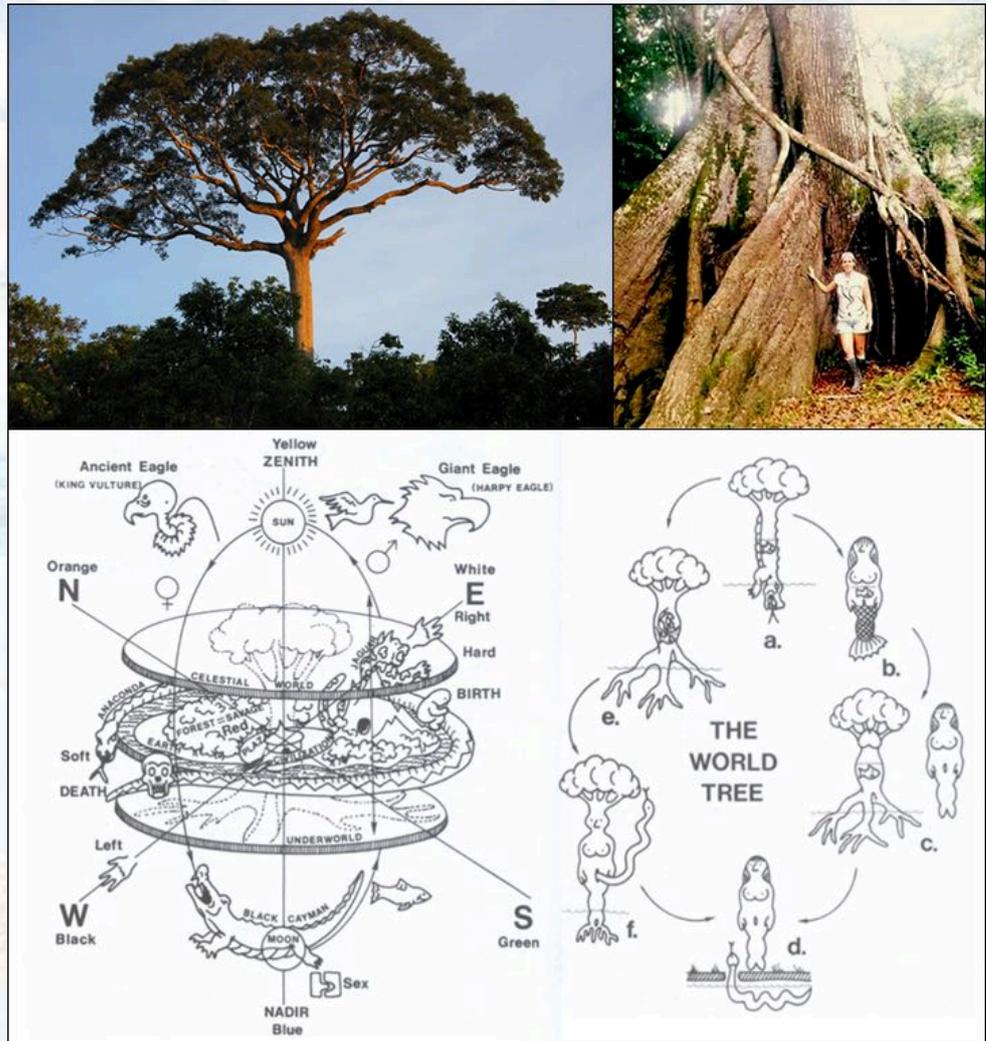

The devaru are objectifications of these relationships and make them known. In another sense devaru are a constitutive part of Nayaka's environment, born of the "affordances" of events in-the-world. Nayaka's "attention" ecologically perceives mutually responsive changes in things in-the-world and at the same time in themselves. These relatednesses are devaru in-the-world, met by Nayaka as they act in, rather than think about, the world. Lastly, I argue that devaru performances — in which performers in trance "bring to life" devaru characters, with whom the participants socialize (talking, joking, arguing, singing, sharing or just demand-sharing, and asking for advice and help) — are social experiences which are nested within (not dichotomized from) social-economic practice. These performances are pivotal in both "educating the attention" to devaru in-the-world (Gibson 1979) and reproducing devaru as dividual persons.

The third part of her paper argues that hunter-gatherer animism constitutes a relational (not a failed) epistemology. This epistemology is about knowing the world by focusing primarily on relatednesses, from a related point of view, within the shifting horizons of the related viewer. The knowing grows from and is the knower's skills of maintaining relatedness with the known. This epistemology is regarded by Nayaka (and probably other indigenous peoples we call hunter-gatherers) as authoritative against other ways of knowing the world.

Shipibo: Split Creations and World Trees

An insight into the complex dynamic animistic cosmologies of the lowland Amazonian peoples can be gleaned from Peter Roe's (1982) "The Cosmic Zygote: Cosmology in the Amazon Basin". These are highly evolved cosmologies of the pre-Colombian era that are characterised by their extremes of creation and destruction, light and dark. They are not the simple hospitable symbiosis we shall see in the Pygmies of the Congo Basin. Because of the disruptive influences of colonial missionary activities, even in this relatively remote region since the arrival of Columbus, the original cosmology of the Shipibo has become fractured and is only revealed in scattered myths, so has had to be reconstructed by Roe from the broader sweep of beliefs of the surrounding lowland people as a whole.

Fig 166: The giant lupuna tree, now under threat of extinction due to deforestation and the lowland Amazonian cosmology of the cosmic zygote and world tree. Lower right: Permutations of the World Tree as Key Symbol: (a) Dragon Tree, (b) Fish woman, (c) Phallic World Tree with Woman Shaman Guardian, (d) First Woman and the Ambulatory Phallus, (e) Botanical Tree with the Dragon (Frog Variant) on the Inside, and (f) Woman Tree, Alias the Wooden Bride.

The cosmology has at its heart the World Tree which supports the sky, whose roots are deep in the underworld and its role is repeated at the cardinal points by other world pillars: "At the cardinal and inter-cardinal points of the universe, there are world mountains that are believed to be gigantic petrified trees". The world tree is a motif

present in diverse religions and mythologies, from Indo-European, through Siberian, to Native American, represented as a colossal tree which supports the heavens, connecting the heavens, the terrestrial world, and, through its roots, the underworld. It may also be strongly connected to the motif of the tree of life, but it is the source of wisdom of the ages. Specific world trees include *égig éró fa* in Hungarian mythology, *Ağaç Ana* in Turkic mythology, *Andndayin Ca' r* in Armenian mythology, *Modun* in Mongol mythology, *Yggdrasil* in Norse mythology, *Irmisul* in Germanic mythology, the oak in Slavic, Finnish and Baltic, *Iroko* in Yoruba religion, *Jianmu* in Chinese mythology, and in Hindu mythology the *Ashvattha* (a *Ficus religiosa*).

South American cosmologies are dynamic in time, not static. The worlds depicted are members of only one cyclic variation, the current one. These worlds are the successors of previous imperfect worlds, destroyed long ago by flood or fire, just as in the Andean and Mexican systems. They were populated by doomed creatures and imperfect protohumans who were turned to stone. The base of these oscillations is a dyadic succession of a terrestrial flood ending the world followed by the extinction of life on the second world by celestial fire. In turn, the current world will also end in a way that repeats the initial emergence of mankind, devoured by monsters, by having the huge demons become houses to swallow their human inhabitants. This primal cosmic periodicity is linked to the yearly periodicity of the wet season-dry season. That, in turn, is linked to the monthly periodicity of women's physiological cycle: menstruation-receptivity. Last, all these levels are represented in the daily periodicity of the night-day cycle.

The symmetry of the worlds above and below the earth also complements other kinds of symmetries. For example, the souls or spirits of the dead are found both in the underworld(s) and in the sky world; or there may be two realms of darkness, one in the lowest underworld and one, paradoxically, in the highest heaven where the sun lives. Summarising this symmetry is the prevailing symmetry of good and evil. However many superimposed worlds there may be, good is always associated with the upper levels and increases as one goes higher, whereas evil is always linked with the lower realms and increases as one goes downward. In keeping with the dualism of Shipibo cosmology, there

are two shamans, one specialising in good and the other in evil. Each are responsible for the contrasting worlds of golden yellow celestial sun, birds, and curing, and the black night of raw poisons, stinging insects, snakes and thorns, devouring anacondas, disease, and cold waters.

This relationship between good and evil differs from Monotheism where a moral regime stipulates a battle of good against evil as the ultimate enemy subject to dire punishments by God in the life hereafter. Here it is the good and bad, or light and dark aspects of reality as a whole, just as nature is a dynamic between symbiotic paradise and the tooth and claw of predation and disease, in the endless round of decomposition and regeneration.

By a complicated train of associations, the World Tree is usually associated with the devouring Dragon and its minor form, the frog, and then, via the powerful poisons certain species of tree frog possess, with fish poison. It is a tall, beautiful tree, 25 to 50 meters in height. Its crown is spreading and umbrella-like and forms its most characteristic feature. The tree occurs on the lower Río Santiago and Huallaga, and on the Middle Ucayali... Its sap is said to be very poisonous.

Fig 167: Shipibo textiles and ayahuasca shamans. Shipibo culture has become a popular psychedelic tourism destination.

The effects of the drug ayahuasca or *nishi* are accompanied by nausea and often vomiting after the first infusion of the pungent mud-coloured brew. Then a series of phosphors fill the peripheries of one's vision, floating in the blackness of the night. They are followed by a brilliant kaleidoscope of shifting, multi-colored geometric patterns that succeed themselves in a bewildering array, filling one's field of vision. Then, as the vision deepens, animal figures appear, large felines and large snakes taking pride of place. They can menace the novice celebrant, but the experienced shaman knows them well. At the same time there is a feeling of the dissolution of one's body, or of flying. It is at this stage that the shaman ascends to heaven escorted by flocks of radiant birds. If the good shaman uses *nishi* to cure his patients, the bad shaman uses *toé* prepared from a species of *Datura* to bewitch them. Whereas the good shaman consumes a "cooked," and therefore cultured, hallucinogen, the evil shaman drinks a "raw" and bewitchingly natural *toé* brew.

The soul of the lupuna tree is an evil demon or *joshin*, which appears to the Indian narcotised by ayahuasca as an evil wizard smoking an enormous pipe. The sap of the tree forms the mysterious poison which the wizard secretly sends against those whom he wants to harm. Every particular tree and plant has its indwelling spirit, which forms the principle of its life and growth. When a tree is felled, this is regarded as an offence against its spirit. Every tree has what the Indians call its "mother" (and which he equates with "soul").

In the centre of the human world stands the maloca ("communal house"). Its central post is an axis mundi. Perhaps the best model for the human geography of the surface of the world-platter would be a series of concentric rings, beginning with that central house pillar; moving out to the walls of the hut itself; and then beyond, to the cleared plaza, a testament to the power of collective human labor to keep the ever-encroaching jungle at bay; then to the house garden and its familiar useful plants; and finally to the bordering lake, river, or stream, where the spirits begin; or in the opposite direction, toward the interior of the dark tropical forest where other spirits dwell.

Because the maloca is a central place, it is associated with the central part of the female body the belly. This anticipated my finding that the World Tree, which sits in the very centre of this central place, has a trunk (belly) pregnant with fish, just as the first mythical Fish Woman has. Thus the house pillar of the maloca is simultaneously a symbol of the World Tree out of which it is metaphorically carved. The Makiritare, for example, liken the central house

post to the connection between heaven and earth, a centre that is filled with water.

Fig 168 "The Spirits or Mothers of the Plants" (Luna & Amaringo 1991) . A Shipibo ayahuasca session (lower left) in which the visions include the spirits of the plants and trees perceived as persons, snakes, and a group of bushes whose spirits are women in a conversation, forest animals and spiritual sages.

The House Pillar Tree is also a phallic entity via its masculine-associated long dance staff. This stick-rattle, like the World Tree it represents connects the three levels of the universe; yet it is solid not hollow. All of its attributes are masculine in contrast to the feminine, hollow attributes of the

World Tree. The top of the staff is decorated with feathers of a male-associated bird, the hummingbird. It is related to the jaguar, in his yellow guise a quintessentially masculine animal, and to the sun, the masculine symbol par excellence. When the dance staff is plunged into the feminine earth, it becomes like a digging stick in its metaphorical restatement of the fertilising sexual act. Drops of semen flow down the stick to fertilise the earth. Later, up the stick crawl the result of fertilisation: human progeny. They come from the watery depths and flow upward just like the souls of the dead, which rise up the World Tree through its roots, which penetrate the underworld by a kind of capillary action.

In short, the maloca itself is a microcosm of sex that replicates the macrocosmic egg of which it is a part. Its central armature, the House Pillar Tree = Phallic Staff, copulates with the round shell of the roof that encloses it. Thus it is the beginning of life, the central shaft hard and solid, whereas the leafy exterior wall is soft and hollow. But at the end of life the central pillar turns into a hollow trunk. It rots, and water is found in its soft interior at the same time that, paradoxically, its solid branches above give new life through their dangling fruits. The Tukano symbolize this essentially ambiguous figure by seeing in their drug-induced hallucinations the house pillars covered with undulating snakes.

The World Tree as House Pillar Tree also has ties with that other connecting symbol, the mountain. Mountains are hollow like the World Tree; they have caves that communicate with the lower aqueous realms. The Kogi make this transitive association when they refer to a hut as a cave, and a cave as a womb. The Warao synthesize these two metaphors-hollow wooden tree and hollow stone mountain-when they refer to the gigantic central petrified wood tree trunk that helps hold up the world and that descends to the underworld. By its side there is an entrance to a cave that leads into the mountain. The rapidly opening and shutting doors of the cave stand for the devouring vagina-jaws of the dangerous subterranean serpent that lives within the mountain and swallows the unlucky souls of those who fail to clear the gate, reducing them to bones. This establishes a mountain = serpent equation congruent with both the World Tree = serpent association and the World Tree - mountain linkage.

The trunk of the World Tree emerges from the underworld and passes through the earth of living men. Its leafy crown pushes into the firmament, just as the forest giants of the triple-tiered tropical forest shoulder their way up through the highest canopy into the sun. There, in the celestial realm, as the Shipibo version has it, the branches of the World Tree are associated with fruits and birds. In addition to having all the alimentary plants such as plantains hanging from its branches, the food tree is also festooned with the hides of all animals and people who wait anxiously below for their coverings so they can assume their respective natures. Thus the Food Tree gives all life: vegetable, animal, and human. It is not only the source of provisions and living beings; it is also the source of the technological means to those provisions. In the Shipibo myth this great tree plays a central role in creation as it mediates the forest giant, Niwëru that grew at the sacred site of Cumancayacocha. It is identified by them as being the location of the first Shipibo village. Again we see that the origin of the group is linked with the central place or origin of the universe.

When the sun first emerged, its rays hit the branches of the tree hanging heavy with fruit. The fruit dropped into the lake like rain. Fish, attracted to the surface by the sound of their splashing impact, began to eat the bobbing fruit. As the fish took bites out of them there emerged all the species of birds there are in the world. The leaves of the tree were later used by a woman shaman to prepare flight medicine that levitated the entire site off the ground and sent it flying off through the air to the accompaniment of drums and flutes until it eventually descended to earth again on a mountain downriver at Canshahuaya.

From bottom to top, the World Tree is a symbolic continuum incorporating both male and female aspects, life and death, in a single concrete object. The roots themselves are filth, strings of mucus, ridden with vermin, which penetrate beneath the earth and enter the pathogenic waters of the subaquatic underworld, it is interesting that there is a further connection between the World Tree and the Milky Way, which has equally pathogenic aspects, although it is a celestial phenomenon. The Mocovi and the Bororo believe the Milky Way to be the ashes of the Tree of the World after it had been burned down. If the worlds reverse themselves at nightfall, then so too do the parts of the World Tree; its branches become its roots, and its roots, branches. The verminous roots, therefore, now spread as branches against the dark orb of the night sky and there connect with the flowing river of sickness, the Milky Way, which is itself the leaking product of the World Tree's upended trunk. The right side of the enormous petrified tree is covered with leaves while the left side is covered with the thorns so prevalent on Amazonian vegetation. This vertical division corresponds with the general lowland associations of left = negative and right = positive, which are then related to female and male, respectively.

Fig 169: Amazonian Minga movement protest at Cop26 November 2021.

*The forest is a conscious ecosystem from which
they are ontologically inseparable ...
A ritual ecology is in place, one in which man's ritual
must conform to the relationship between
the species to maintain an ideal balance between
the beings that inhabit and constitute the forest. (Wastian 2016)*

Meso-American Animism and the Huichol

The contrast between the dark side of the night and the light side of the day, also has parallels with the Meso-American tonal and the nagual. In Nahuatl the word tonalli is used to refer both to a day and to the animal associated with that day. Where the tonal is the day spirit itself, the nagual is the witching familiar spirit of the day – the nighttime aspect of the tonalli. In rural Mexico, nagual is sometimes synonymous with brujo ("wizard") – one who is able to shapeshift into an animal at night. The nagual trait is acquired at birth, along with other characteristics associated with a person's birth day. Nagualism is linked with pre-Columbian shamanistic practices through Pre-classic Olmec depictions, interpreted as human beings transforming themselves into animals. In Aztec mythology the god Tezcatlipoca was the protector of nagualism, because his tonal was the jaguar and he governed the distribution of wealth. In some indigenous communities the nagual is integrated into the religious hierarchy. The community knows who is a nagual, tolerating, fearing and respecting them. Nagualli are hired to remove curses cast by other nagualli. Carlos Castaneda (1968) defined the nagual as, "*the teacher who becomes the gateway, the doorway, the intermediate between the world of the 'seeker' or apprentice, and the world of the spirit.*"

The Huichol or Wixárika living in the Sierra Madre Occidental range of Mexico traditionally use peyote (*hikuri*) cactus in religious rituals which accurately reflect pre-Columbian practices. These involve singing, weeping, and contact with ancestor spirits. They travel long distances by foot over 600 km in all from their homeland to Wirikuta the high desert with a mountain above beside the old silver mining town of El Catorce Real, where they go each year to collect peyote (Meyerhoff 1974, Furst 1972 136). The journey involves many ritual steps and many days of journey involving hardship. The confessing of marital infidelities is done without recrimination. The Huichol are polygamous and traditionally accept such revelations with a light heart. A knot is placed in a string for each occasion and then burned.

One of the greatest Mara'akame discussed in the entheogens chapter was don Jose Matsuwa who at 1990 was the venerable age of 109.

"Might the sacred country be a kind of "Great Mother"? If so we would have at least one explanation for the emphasis on ridding oneself of all adult sexual experience before embarking on the journey, lest the whole enterprise come to naught and the offender go

mad in Wirikuta. To 'enter' the great mother as an experienced adult would be tantamount to incest. ... I want to emphasize that there is no overt equation of Wirikuta with a "Great Mother" in the Huichol peyote traditions, yet it is implied: one need only recall the emphasis on the embrace of the hummingbird-children by the Mother Goddess Niwetuka(me) as they finally reach the peyote country" (Furst 158).

Fig 170: Top-left: About to descend to the Encinos kaliwey. Lower-left: The first offerings are made at the sacred site Tatei Matynieri which the Mother Goddess of the Rain inhabits. Centre: Each pilgrim must publicly confess all of their previous romantic partners. Knots are then tied in a palm leaf for each name mentioned. Everyone then places their palm leaves into the fire as a symbol of letting go of the past. Huichols tell their dreams to "Grandfather fire". Right: Mara'akame (shaman – the one who knows how to dream) Don José Luis Ramirez (Uxamuire) with the first hunted peyote at Wirikuta (José Andrés Solórzano). The Peyote can open the Nierika or cosmic portal of Kauyumari or Elder Brother Deer, linking the underworld with Mother Earth, through which the gods came. Through it all life came into being. It unifies the spirit of all things and all worlds.

They cross steppes, including the "Cloud Gate" and "Where the Clouds Open". Crossing the 'dangerous passage' the gateway of the clouds they are blindfolded. "From there one travels to the place called Vagina .. and from there directly to Tatei Matinieri - Where Our Mother Dwells." (Furst 162). They pass by the sacred springs of Tatei Matiniéri ("Where Our Mother Lives"), the house of the eastern rain goddess. Also notable is the place where the penis hangs.

This pilgrimage takes place annually as a desire to return to where life originated and heal oneself, assuming the roles of gods along the trail. Upon arrival in the high desert of Wirikuta, the hunt begins and the first cactus that is found. With rising excitement the mara'akáme- spiritual leader rushes ahead and fires arrows to enclose the first peyote on all quarters and exclaims 'how sacred, how beautiful, the five-pointed deer!'. He then cuts the hikuri leaving some root to regrow new crowns and it is shared among everyone. Then they harvest enough peyote for the year (since they only make the trip one time every year). After the work is done, they eat enough peyote and have visions to be able to speak to the gods and ensure the regeneration of the souls of the people. The return to Wirikuta the sacred mountain is seen as a return to paradise.

*"One day it will be all as you have seen it there in Wirikuta.
The first people will come back. The fields will be pure and crystalline.
The world will end and it will all be pure again".*

"The Peyote Hunt represents a historical and mystical return to the original Huichol homeland and way of life, and a symbolic re-creation of "original times" before the present separation occurred between man, gods, plants, and animals; between life and death, between the natural and supernatural; and between the sexes. On the Peyote Hunt, men become gods and at the most dramatic moment of the event, when the first peyote is "slain" and eaten, the important social distinctions of age, sex, ritual status, regional differences and family affiliations, are eliminated. A state of unity and continuity, which epitomizes the Huichol view of "the good," is reached and this continuity is between man, nature, society, and the supernatural. The "retrieval" of this unity is seen as perhaps the most important function of the ceremony, and of the entire symbol complex" (Meyerhoff 1970).

The **nierika** is the cosmic portal through which those observing the rituals and taking peyote can enter the spirit world:

Back in the first times after the sun [Tayaupa] had a dream of a new world he sent Kauyumari to find it. The Little Deer Spirit was informed by the sun where a great swirling tunnel of light existed, through which he was to pass. This is the nierika. He was led by Tatewari, Great Grandfather Fire, and quite a number of uricate. They travelled through the portal arriving in the world in which we now live. They created everything. So beautiful was the new world that even the sun travelled through to take his place in the sky. Because Kauyumari became too enamoured of the Huichol girls and disrupted the sacred rituals dedicated to the sun with jealousies, resulting in suffering and prompting the sun to free them from their misery, he caused rains to come and flood the entire world. Only one Huichol Watakame was saved, being warned by Nakawe Great Grandmother Growth that he should gather seeds, build a canoe and prepare himself. The world repopulated quickly after Watakame was given a wife, but he found that his offspring had no

memory of the *nerika* and did not have the psychic powers of their forebears. From this time on only those who were willing to suffer the rigours of self-sacrifice would know *nerika*.

In their rituals they interact with the primal ancestor spirits of fire, deer, and other elements of the natural world. Their principal deities are the trinity of Corn, Blue Deer and Peyote, and the Eagle, all descended from the Sun God, "Tao Jreku". They believe that two opposed cosmic forces exist in the world: an igneous one represented by Tayaupá, "Our Father" the Sun, and an aquatic one, represented by Nacawé, the Rain Goddess. "The eagle-stars, our Father's luminous creatures, hurl themselves into the lagoons and ... Nacawé's water serpents ... rise into the skies to shape the clouds". In their creation, the Sun made earthly beings with his saliva, which appeared as red foam on the surface of the ocean's waves. "New things are born from "hearts" or essences, which the Huichol see in the red sea foam that flowed from Our Father the Sun The Sun itself has a "heart" that is its forerunner. It adopts the shape of a bird, the *tau kúkai*. The bird came out of the underworld and placed a cross on the ocean. Father Sun was born, climbed up the cross, in this way killing the world's darkness with his blows".

The Huichol shamans say we are *perdido*, lost⁵⁴. They say we are bringing doom and destruction to Yurianaka, Mother Earth, and that Taupa, Father Sun, is coming closer to the earth to purify it. They are concerned for the future and for the life of their children. They are holding great ceremonies calling in shamans from many areas to try and "hold up the sun." But they know they cannot do it themselves, for they are not the ones soiling the collective nest. We are. We are the ones who have to wake up, who have to find our lives.

*For the Huichols, this is the purpose of their sacred pilgrimage to the holy land of Wiricuta — to find their lives. This is what all their ceremonies involving the ritual use of the peyote help them to accomplish. For shamanic peoples such as the Huichols, the purpose in changing channels is not for escapism, to get lost in imaginary hallucinations that have no basis in reality. Their purpose is to get a more accurate reading of the nature of reality. They seek entrance through the *nerika* into the numinous universe underlying the limited, material world of the sensory—the "mysterious, ubiquitous, concentrated form of non-material energy . . . loose about the world and contained in a more or less condensed degree by all objects" (Bob Calahan in his introduction to Jaimie de Angulo's Coyote Man and Old Doctor Loon).*

Why? To obtain information, healing, and power, which they can use here on this plane of existence to better their lives and the lives of their people. Entering into the depths of the mystery is not something to take lightly, for the mystery is all about power and power can manifest itself in many ways. Out of respect, the Wisdom Elders observe, listen, and commune with this power in all its manifestations. From this base of phenomenological data of mind in nature, nature in mind, they came to learn the order and structure of life's connectedness and that all things are dependent upon each other and thus related. Recognizing this, the norm of reciprocity in all interactions is raised to the status of sacred. Balanced reciprocity with all of creation is observed at all costs, for without this practice, the fragile web of life is irreversibly damaged, a fate that faces us today.

Kogi: Guardians of the Great Mother of Nature, Life and the Universe

The Kogi, meaning "jaguar", form an intriguing example of a theocratic culture whose spirituality is a form of cosmology based on "Aluna" the Great Mother, who they believe is the force behind nature, supported by male guardians called Mamos and the ritual consumption of coca leaves, which they consume using traditional lime as an activator of the free base, whose ritual also comprises accumulating the expressed lime on a *poporo* – a female gourd with a male stick, which slowly accumulates a growing lime spool over a man's lifetime. Unbalanced masculinity, without this image of both sexes working together would be dangerous. When two Kogi men meet, they use the customary greeting, which is to exchange handfuls of coca.

*I watched, fascinated, as Izquierdo moistened a wooden stick with saliva and dipped it into a *poporo* (a gourd filled with lime from powdered seashells), a carry-over from pre-Columbian civilisation. Izquierdo extracted some lime, wiped it on a wad of coca leaves to enhance the coca's stimulating effect, and stuffed the wad in his mouth. The thick limescale, the hard residue that builds by incremental degree with each wipe around the rim of the gourd, is a living library of every thought underlying every stroke of the stick. For the Arhuaco, an individual's every thought or dream is literally recorded by the metaphorical action of *poporeando* (dipping into the *poporo*). "We write our thoughts with it. It's a record of a man's entire life," Izquierdo said.*

Mamos are ideally chosen by divination at birth and kept for nine years in a darkened house and cave, fed by their mother and taught by elder Mamos in sensory deprivation designed to induce a direct connection with the universe as a whole to teach the child to attune to "Aluna" – the inner reality of the world – before the boy enters the outside world. The mother, as well as Mamo's generally are required to eat white food as this is the colour of the Great Mother.

⁵⁴*perdido* –lost, done for, ruined, defeated or about to be killed etc. Cambridge Dictionary

Fig 171: Top: A Kogi village, Each family has a man's house and a second for the women and the children, who are conceived in the fields, the ancient ruins of Ciudad Perdido (Lost city) to which the believed to have been founded around 800 CE, about 650 years earlier than Machu Picchu. The Kogi call the city Teyuna and believe it was the heart of a network of villages inhabited by their forebears, the Tairona. Centre: A family working to maintain gardens. The Kogi are small scale farmer gardeners that live ecologically. Right, are men with their poporo's – a gourd and stick as female and male complements, to hold lime used to activate the coca leaf, and to coat the poporo over decades, forming a life history of the man's thoughts and deeds. The women do likewise with their weaving. Lower: A male reaching manhood is initiated by taking his coca leaf and lime, followed by four days and nights without sleep being inculcated into manhood in the large sacred men's house.

Mamo Bernadino who comes from a long Mamo line, sates adult Kogi life expectancy as 90. His father died at 102, His description to the novice reaching manhood is very consistent with the intense mental concentration induced by coca:

Ask for your poporo, think about it, ask for your mind, for the spirit guardians to grant these. The guardian of the poporo guarded the stick. The guardian of the gourds. You mustn't give up using the poporo and eating the coca, now or in the future, otherwise you're not a man and can't be married. It's a woman. Now that you can use it, you can take a wife, but you have to think carefully. When you are married and you take a woman, you have to look after her, you have to work for her. You mustn't ever hit her, or mistreat her. At night before you sleep, chew the leaf. Chew four times at least to help you think clearly. And think what you need to do the next day. What things need to be done and how you are going to do them. Think it through.

Kogi religion is defined in terms of the structure of the cosmic universe that exists in complementary expressions. The sun separates the universe into two hemispheres: the east/west, leading to a series of complements: male/female, heat/cold, light/dark, and right/left. Within each pair, one cannot survive without the other. In the case of good(right)/evil(left), the Kogi believe committing a sin once in a while serves as a justification for the existence of good. These natural opposites are a way to keep the society balanced or "in agreement" (yuluka). In Kogi cosmology, they have added three dimensions to the standard N/S/E/W: Zenith, Nadir and the Center. Mother Goddess, the creator of the universe and mankind, created the cosmic egg lying at the centre. The horizontal layers of the egg are divided into two sections of four worlds with mankind (the 5th layer) in the centre. The egg also represents the uterus of Mother Goddess and the Sierra Nevada. Because of this, the Kogi have built the structure of the ceremonial house as a replica of the cosmos.

In the beginning, there was blackness. Only the sea. In the beginning, there was no sun, no moon, no people. In the beginning there were no animals, no plants, only the sea. The sea was the mother. The mother was not people. She was not anything, nothing at all. She was when she was. Spirit. She was memory and possibility. She was the womb.

"The thoughts of our ancestors are embedded in every rock and other element in which humans have contact," said Izquierdo, who holds to Arhuaco belief that we exist in a conscious universe where all material things have life and awareness.

The Kogi understand the Earth to be a living being, and see humanity as its "children." They say that our actions of exploitation, devastation, and plundering for resources is weakening "The Great Mother" and leading to our destruction. They have made repeated efforts to warn the world of their evidence for a coming disaster of special extinction and climate crisis leading to a [BBC program](#) and many [documentaries](#) on their warnings.

Humans need water – they have to have water to live. The Earth is the same. Now it is weak and diseased. The animals die, the trees dry up. When new diseases appear, there will be no cure or medicine for them and the reason is that younger brother is violating fundamental principles continually drilling, mining, extracting petrol, minerals, stripping away the world. This is destroying all order and damaging the world. Tell the younger brother open your eyes, hear the mamas law and story how things really are. But now they are taking out the Mother's heart, they are digging up the ground and cutting out her liver, her guts. The Mother is being cut to pieces and stripped of everything. From their first landing they have been doing this. They are cutting out her eyes and ears. So the Mother too is sad and she will end and the world ends if you do not stop digging and digging. The mama must look after younger brother and the elder brother and the animals and the plants and all that is natural. Because the mama has a duty to care for all kinds of creatures and all kinds of people.

When I was 20 years old the water in the basin was plentiful. At that time there was no bird disease, or anything like that. Also it rained a lot. There were many animals. With the balance of the water and the frog shaped crystals are the ones that make it rain. All these quartz left them organised to protect and balance the Earth. Now that I am 50 years old, I see this place is destroyed and in this desecration, they also took the quartz from the Sun, from the Ayú (Coca leaf) the quartz that protects the human being, the crystals of the water, quartz of the light, quartz that represents the man and woman, quartz that was organised for food, and quartz for blood in the veins of the earth, all of this they took. By this attitude of man, the birds began to disappear, by removing the quartz that represents the pigs, now the animals begin to disappear. These materials our Mother left to protect all that exists, but everything was taken away many other kinds of frogs and other figures were also taken away. As a result of this there are diseases in man and nature. ... Neither with the spiritual works that we do can we repair the damage you caused, that's why we want you to help us take care to stop hurting ur Mother any more. If you are really willing to support this work, I will be really grateful.

Kogi are descendants of the Tairona culture, an advanced civilisation which built many stone structures and pathways in the jungles and made many gold objects which they would hang from trees and around their necks. The Tairona were forced to move into the highlands when the Caribs invaded around 1000 CE. This proved beneficial and strategic by the time the Spanish entered modern-day Colombia in the 15th century. The Kogi Mamos have remained isolated from the rest of the world since the Spanish Conquistadors, and this has resulted in an unbroken cultural tradition over the last 500 years preserving the key aspects of Tairona culture including its coca consumption.

Fig 172: A kogi Mamo and Kogi dress. Kogi men and women alike have simple modes of dress. The women pick, card, and spin wool and cotton while men do the weaving of the cloth. Men wear a tunic and pants tied with a string at the waist. Women have a single length of cloth wrapped around their bodies as a dress. The Kogi all wear only pure white clothing. They say that white represents the Great Mother and therefore the purity of nature.

Their homeland – the world's highest coastal mountain range – comprises every distinct climatic ecosystem in Colombia, from coastal wetlands and equatorial rainforest to alpine tundra and 5,000m glacial peaks. Declared by Unesco in 1979 as a [Biosphere Reserve of Man and Humanity](#), the mountain range was named as one of the most irreplaceable ecosystems on Earth (Le Saout et al. 2013). The Kogi practice agriculture using slash-and-burn farming methods. Each family tends farms at varying altitudes of the Sierra, producing different crops to satisfy the range of their needs. Five to more than fifty single-family houses make up a village. These houses are not permanently occupied as each family has multiple houses at different altitudes. The villages "are simply gathering places where neighbors come together periodically, perhaps twice a month, to exchange news, discuss community matters, perform some minor rituals, or to trade with visiting Creole peasants. They also raise cattle on the highlands. They live in villages,

called Kuibolos. Men live in a separate hut from the women and children. Each Kuibolo contains a large temple hut – the "nuhue" where only men are allowed and where divination and concentration, discussions and decisions are made. Women are not allowed because the Kogi believe that women are more connected to the Great Mother and have no need of entering the temple. There are also women priests in the villages. The Kogi do not allow the mistreatment of women, and it is not uncommon to find marriages that were not arranged, but the Kogi also disapprove of breaking arranged marriages. For nine days and nights, after death they turn the body so that the soul wanders on a journey that ends in rebirth of that soul (Reichel-Dolmatoff 1990).

Fields, houses, and livestock are passed from mother to daughter as well as from father to son, which is bilateral inheritance of these items. There is also the normal parallel descent of personal items, including ritual objects which are male property and descend patrilineally. But certain rights, names or associations descend matrilineally. Generally speaking, the Kogi are an austere people with a limited and plain material culture, including a general lack of adornment. Some items (such as cloth bags) have lineage specific markings, but most items are crudely made and utilitarian. The lack of protein resources leaves the Kogi in a chronic state of malnutrition. Marriage is only to other Kogi; they do not intermarry with their Creole or Colombian neighbors. The Kogi have peaceful relationships with other societies. They trade with their Creole neighbors and occasionally visit and trade with Colombian villages and towns. Their traditions mention past warfare with the invading Spanish and other tribes, but very little lethal conflict since the Spanish conquest. No cases of in-group or out group homicides are recorded. (Mahnke M Kogi survey).

The 15,000 Kogi share a Tairona descent with the 27,000 Arhuacos who have the same white dress style and social traditions, with the Mamos and the coca poporo, among subtle differences such as smaller square houses, more colourful female attire. The mochila – popular ornate woven bags are the most representative item of the Arhuaco people. These organic and 100% natural cross-body bags are mainly worn by the men. The bags are only woven by *Wati* (Arhuaco women) who possess the energy and the wisdom to make a unique creation for their husbands. They also have a subtly different cosmology. They believe in a male creator or "father" – *Kakü Serankua*, who engendered the first gods and material living things, other "fathers" like the sun and the snowy peaks and other "mothers" like the earth and the moon. Nature and society as a unity are ruled by a single sacred law, immutable, pre-existent, primitive and survivor to everyone and everything. The material world can exist or cease to exist but this law is believed to continue without being altered. This universal law *Kunsamü* is represented by a boy, *Mamo Niankua*. This law of nature is an explanation of the origins of matter and its evolution, equilibrium, preservation and harmony, that constitutes the fundamental objectives and the reason being of the Mamo; the spiritual authority of the Arhuaco society. They specialise in certain knowledge areas such as philosophy, sacerdotalism, medicine and practical community or individual counsellors.

They likewise consider the Sierra Nevada de Santa Marta to be the heart of the world, and believe that the well-being of the rest of the world depends on it, but the Earth and its climate and species are being destroyed by younger brother. Anthropologist Felipe Cárdenas has been working with the Arhuacos and the Kogis for decades and remembers hearing these predictions as early as 1980, when he began studying their divination practices. "They have a repertoire of knowledge on how to read nature like a book, not only from an intellectual, rational way of knowing," Cárdenas said. "To them, nature is like a great text, a great library that is sending messages and transforming them into a wise man or woman."

The Way of the Ultimate Tao

Fig 173: The Dragon of Order amidst the swirling Chaos of the Abyss (Rawson and Legeza R440)

*There was something complete and mysterious
Existing before heaven and earth,
Silent, invisible,
Unchanging, standing alone,
Unceasing, ever in motion.
Able to be the mother of the world.
I do not know its name.
Call it Tao. Lao Tsu.*

Complementarity: The Tao of Physics, Nature and Gender

The foundation of the mind and of the universe is the Tao. It is forever a complementation, not a Decartesian duality, across which there is an indivisible gulf, but the intimate marriage of realities - It is the hieros gamos of nature itself.

From the beginning, both mind and universe exist as paradoxical complements, each discovering its own nature through its complement. From birth to death, all our experience of reality is through the magic warp and weft of the subjective conscious mind. It is the umbilicus of reality without which the physical universe would be an abyss without even a dream of existence.

Yet the physical universe is also fundamental to existence, for through it our manifold dreams of existence find one common ground of objectivity in which the entire historical process of incarnation can come to a meaningful account. We are physical. We bleed when cut and swoon when concussed. Yet the description of physical reality is no more and no less than a myth told about the stabilities and correspondences of our conscious experience.

The phenomena of the physical universe are themselves in a state of a paradox of relativity and quantum uncertainty in which the future and the past become lost in probabilities which can never be disentangled from their quantum superpositions until the reaper of experience casts our lot and the world becomes frozen into the history we see being made before our eyes.

For the universe is forever the Tao of Physics, the paradoxical interplay of wave and particle, and as natural processes gather into the macroscopic world of experience, chaos and order, as the weather, evolution and conscious thought alike attest. For order to attempt to rule over chaos is as futile as for the particle to try to rule over the wave. Any society which attempts to rule by order alone is doomed to catastrophe as the natural process transition becomes frozen into an apocalyptic revolution collapsing the old order.

In regard to nature, the imposition of order, by domination of nature, through belief that the rule of order of civilisation can continue until the evidence to the contrary is incontestable is suicidal. By this time many chaotic transitions have reached irreversible crisis and we become doomed by our own rigid lack of sensitivity and foresight. This the why we need inebriety of foresight, and the samadhi of contemplation as well as the rational scientific approach when dealing with the uncarved block of future possibilities.

The natural order requires complementation between the harmonious rule of order and a continuing respect for the fertility of chaos. Order needs to be at all times suppliant and responsive to fertile transition so that new order can emerge from the natural ferment of chaos.

The Tao is the path of nature. It is not only living with nature but being nature as individuals and in the societies we foster and the cultures we celebrate. The way of nature is also the way of life and death, of tooth and claw, but it is the role of immortal wisdom to understand nature in all her complements and to utilize her bounty in arriving at a just and harmonious existence, without imposing on her our own selfish designs. In doing so we are 'future dreaming' engaging in a vision quest of the evolutionary unfolding. The Tao stresses moving with the forces of nature in utilizing their own flow sustainably, not in dominion and domination.

The Way of the Valley

In the "Tao te Ching" (R165, R594), Lao Tsu, or 'old man' provides a clear and organic example of Taoist subtlety in erasing personal history. The work was written only through a twist of fate, because as Lao Tsu was leaving for the wilderness for the last time, he was jailed by the gatekeeper until he wrote down his teachings for posterity. This

'gatekeeper' is himself said to be a great master Yin-hsi of the Kuan (i.e. Han-ku) Pass (Wilhelm 1931 6). It is said that when Lao Tsu walked, the birds and animals would accompany him. Lao Tsu and Confucius were contemporaries and it is said that Confucius met Lao Tsu to take advice from the 'man of the wilderness', whom he found an unnerving foil to his own ideas of social order.

Fig 174 "The dark has a light spot and the light has a dark spot - that's how they can relate to one another" Complementation of male and female nature yin and yang in one another in the Tao (Joseph Campbell).

"In the Taoist perspective, even good and evil are not head-on opposites. The West has tended to dichotomize the two, but Taoists are less categorical. They buttress their reserve with the story of a farmer whose horse ran away. His neighbor commiserated, only to be told, "Who knows what's good or bad?" It was true, for the next day the horse returned, bringing with it a drove of wild horses it had befriended. The neighbor reappeared, this time with congratulations for the windfall. He received the same response: "Who knows what's good or bad?" Again this proved true, for the next day the farmer's son tried to mount one of the wild horses and fell, breaking his leg. More commiserations from the neighbor, which elicited the question, "Who knows what is good or bad?" And for a fourth time the farmer's point prevailed, for the following day soldiers came by commandeering for the army, and the son was exempted because of his injury." Huston Smith, *The World's Religions* (Occhigrosso 1996 153)

The Chinese Tao, natural law, or way provides a cleavage of the totality into complementary creative and receptive principles. The Tao is a seamless web of unbroken movement and change filled with undulations, waves, patterns of ripples, vortices and temporary standing waves like a river. Every observer is an integral functioning part of this web which extends both into the past and into the future throughout space-time. It never stops, never turns back on itself, and none of its patterns of which we can take conceptual snapshots are real in the sense of being permanent, even for the briefest moment of time we can imagine. Like streaming clouds the objects and facts of our world are to the Taoists simply shapes and phases which last long enough in one general form for us to consider them as units. In a strong wind clouds change their shapes fast. In the slowest of the winds of Tao the mountains and rocks of the earth change their shapes very slowly - but continuously and certainly.

No binary, ideal or atomic concept has any independent reality or permanence in this unchanging river of change. No symbol can be separated from the organic context of the whole. Nothing which happens, no event or process ever repeats itself exactly. Nevertheless the Tao is unchanging like a convoluted eroded stone which stands beyond time. Men simply find it hard to observe the fact. All the separations which men claim to decipher in the web of Tao are useful fabrications, concepts being themselves ripples in the 'mental' part of the stream. Each human being himself is woven out of a complex system of totally mobile interactions with his environment. His body is in perpetual change, not by jumps from state to state; for his ageing does not correspond to minutes, hours and birthdays, but goes on all the time.

The twisted and eroded stone was a motif repeated tens of thousands of times in paintings and on ceramics, often combined with trees, flowers and birds. Its reference always is to this truth of Tao as a reality whose essence is never ceasing, perpetual, seamless process. In the face of this intuition, what can man do?

There is a relevant story told in the *Chuang-tzu*, one of the most revered Taoist books. One day Confucius and his pupils were walking by a turbulent river, which swept over rocks, rapids and waterfalls. They saw an old man swimming in the river, far upstream. He was playing in the raging water and went under. Confucius sent his pupils running downstream to try and save him. However, the old man beached safely on the bank, and stood up unharmed, the water streaming from his hair. The pupils brought him to Confucius, who asked him how on earth he had managed to survive in the torrent among the rocks. He answered, 'Oh, I know how to go in with a descending vortex, and come out with an ascending one' (Rawson and Legeza 1973).

In the *Chuang Tzu* Lao Tzu asks Confucius "What is the gist of your teaching?" "The gist of it is benevolence and righteousness." "May I ask if they belong to the inborn nature of man?" asked Lao Tzu. "Of course," said Confucius. "If the gentleman lacks benevolence, he will get nowhere; if he lacks righteousness, he cannot even stay alive. They are truly the inborn nature of man. What else could they be?" Lao Tzu said, "May I ask your definition of benevolence and righteousness?" Confucius said, "To be glad and joyful in mind; to embrace universal love and be without partisanship - this is the true form of benevolence and righteousness." Lao Tzu said, " 'Universal love' - that's a rather nebulous ideal, isn't it? And to be without partisanship is already a kind of partisanship. Do you want to keep the world from

losing its simplicity? Heaven and earth hold fast to their constant ways, the sun and moon to their brightness, the stars and planets to their ranks, the birds and beasts to their flocks, the trees and shrubs to their stands. You have only to go along with Virtue in your actions, to follow the Way in your journey, and already you will be there. Why these flags of benevolence and righteousness, so bravely upraised, as though you were beating a drum and searching for a lost child? Ah, you will bring confusion to the nature of man.”

The Tao, that web of time and change, is a network of vortices like a moving and dangerous torrent of water; and the ideal Taoist is he who has learned to use all his senses and faculties to intuit the shapes of the currents in the Tao, so as to harmonize himself with them completely. Works of art provide some of the means for bringing people into communion with the currents and vortices, giving them a deep sense of their presence, and of the ways in which the tangled skeins evolve.

Fig 175: The Jade Lady among the clouds - Yin as Chaos

Ts'ui Tzu-chung (Rawson and Legeza 1973). One of the most important and complex female deities of Taoism is the Queen Mother of the West, who can confer immortality.

*'Vast indeed is the ultimate Tao,
Spontaneously itself, apparently without acting,
End of all ages and beginning of all ages,
Existing before Earth and existing before Heaven,
Silently embracing the whole of time,
Continuing uninterrupted though all eons, ...
It is the ancestor of all doctrines,
The mystery beyond all mysteries' (Tao te Ching).*

It is only in this sense of unbroken wholeness that the Tao is subdivided into natural complementary creative and receptive principles of yang and yin associated with male and female, day and night, heaven and earth etc. The power of the creative lies beyond the describable, and complements the world of form. The two together form the mysterious totality of existence. Central to the organic nature of the Tao is the inextricable dependence of each attribute on its complement, from which it draws its very identity.

*Under heaven all can see beauty as beauty only because there is ugliness.
All can know good as good only because there is evil.*

The Tao cannot be named, cannot be symbolised nor captured by rational thought or symbols:

*The Tao that can be told is not the eternal Tao. The name that can be named is not the eternal name.
The nameless is the beginning of heaven and earth. The named is the mother of ten thousand things.
Ever desireless, one can see the mystery. Ever desiring, one can see the manifestations.
These two spring from the same source but differ in name; this appears as darkness.
Darkness within darkness. The gate to all mystery.*

The Tao is timeless and ancient, imperceptible and indefinable yet ever present:

*From above it is not bright; From below it is not dark:
An unbroken thread beyond description.
It returns to nothingness. The form of the formless,
The image of the imageless, It is called indefinable beyond imagination.
Stand before it and there is no beginning. Follow it and there is no end.
Stay with the ancient Tao, Move with the present.*

Knowing the ancient beginning is the essence of Tao. Taoist philosophy is singularly relevant to the modern age because it teaches that nature should not be disrupted:

Do you think you can take over the universe and improve it?

*I do not believe it can be done.
The universe is sacred. You cannot improve it.
If you try and change it, you will ruin it.
If you try and hold it, you will lose it.
It also lies beyond simple rules of morality:*

*A brave and passionate man will kill or be killed.
A brave and calm man will always preserve life.
Of these two which is harmful?
Some things are not favoured by heaven.
Who knows why? Even the sage is unsure of this.*

Lao tsu pictures the sage as wild and untamed but in contact with the natural maternal source:

*People have purpose and usefulness
But I alone am ignorant and uncouth
I am different from all the others,
but I draw nourishment from the mother.*

The opposites of male and female, light and dark etc. are not only interdependent, but it is essential for humanity to maintain a receptive relation to the creative Tao. This requires both the feminine receptiveness of the valley of the earth, and the primal pregnancy of the 'uncarved block', and also an attitude towards leadership and control which is humble and submissive and yields to transition rather than imposing order:

*Know the strength of man, But keep a woman's care!
Be the stream of the universe, Ever true and unswerving,
Become as a little child once more.
Know the white, But keep the black! Be an example to the world!
Being an example to the world, Ever true and unwavering,
Return to the infinite. Know honour and humility.
Be the valley of the universe, Ever true and resourceful,
Return to the state of the uncarved block.
When the block is carved it becomes useful.
When the sage uses it he becomes the ruler.
Thus, "A great tailor cuts little" (Lao Tsu).*

Thus man follows the feminine earth, rather than heaven and consequently the creative emerges from nature itself:

*Man follows earth.
Earth follows heaven.
Heaven follows the tao.
Tao follows what is natural.*

Despite being in yielding responsiveness to the natural order, the sage possesses the personal power of the shaman:

*He who knows how to live can walk abroad Without fear of rhinoceros or tiger.
He will not be wounded in battle. For in him rhinoceroses can find no place to thrust their horn,
Tigers no place to use their claws, And weapons no place to pierce.
Why is this so? Because he has no place for death to enter.*

Lao Tsu saw the machinery of the state as a structured force which ran against the verdant abundance of the Tao:

*The more laws and restrictions there are, The poorer people become.
The sharper men's weapons, The more trouble in the land*

The Tao also has an active sexual manifestation similar to Tantrism. The natural complementation of male and female sexual energies, ching, as manifestations of life force became elaborated into a technique of gathering vital energies through active love-making while withholding orgasm. This attitude arises from the pursuit of immortality, and origins in matriarchal land title-holding based on yin-earth identification, resulting in polygamy and the need to maintain many active relationships. The inner alchemy of Taoism is closely related to the practices of Tantric yoga, involving similar chakra centers based on sex, heart and mind, derived from Buddhist influences.

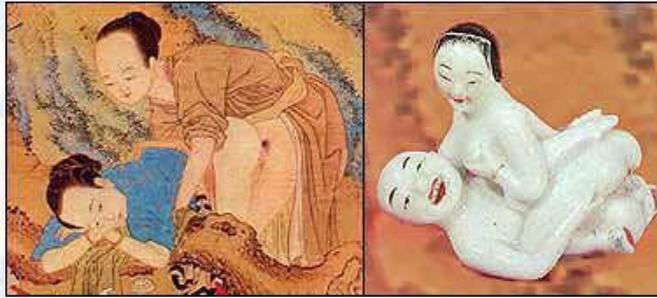

Fig 176: Sexual union is central to Taoist thought. Sex roles give both genders the superior position. Despite the patriarchy, ancient matriarchal identification with the land required conserving male energies to maintain relations with many wives (Rawson and Legeza 1973).

The I Ching oracle (Wilhelm 1960), or book of changes, is a primary example of a sexually paradoxical chance oracle, as it is based on applying uncertainty to the female and male principles of yin and yang. It shows both fundamental Taoist and Confucian influence which was again serendipitously created as a result of incarceration. According to the principles of the I Ching, consciousness, living organisms, and chance are a common manifestation of the cosmic creative principle. Thus the use of chance in throwing the oracle, far from being superstitious faith in the drop of a coin, links to consciousness, uncertainty and to life itself, as with the Urim and Thummim of Judaism, and the Tarot.

Yin and yang are firstly further divided into 8 yin-yang trigrams: heaven (the creative), wind (wood), water (the abyss), mountain (stillness), earth (the receptive), thunder (the arousing), fire (the clinging), the lake (joyful). The trigram transformations are then doubled to give 64 hexagrams, whose $64 \times 64 = 4096$ secondary transformations represent a set of archetypal dynamical situations. This set of 64 states have been carefully designed to give a generic set of conditions. Chance is used to generate a reading by throwing sticks or coins. The results of these two methods differ in the greater probabilities the coin oracle give to moving lines.

The origin of the trigrams is said to go back to Fu Hsi a legendary character from the period of hunting and fishing and the invention of cooking. They are thus of such antiquity that they antedate recorded history. The names of the trigrams do not occur anywhere else in Chinese language leading some to suggest they have a foreign origin although this may be simply due to their very ancient nature. King Wen, the progenitor of the Chou dynasty, elaborated the eight trigrams into a vastly larger system of transformations. King Wen is said to have added brief commentaries when he was imprisoned by the tyrant Chou Hsin. Wen was named king posthumously when his son Wu deposed the house of Shang and began the Chou dynasty which lasted 900 years. His son, the Duke of Chou, added the text of the moving lines. Confucius then studied and added to it in his senescence adding the Commentary on the Decision and less directly the Commentary on the Images.

Karen Armstrong (2022) in "Sacred Nature" notes:

The Dao is not the "creator" of the ten thousand things, looking down on them benignly from afar. Rather, Laozi explains, it is their "mother" and the two are inseparable. Indeed, we cannot know one without the other:

The world has a source: the world's mother. Once you have the mother, You know the children. Once you know the children, Return to the mother. Heaven-and-earth—the cosmos comprising our material world—and the ten thousand things are simply stages in the Dao's own evolution. It is the extraordinary force that holds everything together, makes the world productive and keeps it in being. Every single thing that exists is what it is because it is animated by the creative activity of the Dao.

But the Dao is not an invasive, alien, controlling power. Rather, everything is the Dao. It is, therefore, the de ("nature") of each creature; it is its identity, the force that makes it what it truly is. Thus every single "thing" in the world—animal, plant or mineral—embodies the One in its own unique way. What's more, these "things" are not self-centred; each manifests itself in an environment where it interacts harmoniously with the de of all the other things in its vicinity—in rather the same way that each ingredient in a stew blends with and enhances the others.

Bonpo Tibetan Shamanism

The following summary is from John M Reynolds "Yungdrung Bön [Ancient Tibetan Bonpo Shamanism](#).

The ancient Tibetan shamanism and animism, the pre-Buddhist spiritual and religious culture of Tibet, was known as Bon, and a practitioner of these shamanic techniques of ecstasy and ritual magic, the methods of working with energy, was known as a Bonpo. Bonpo is still the designation for a shaman in many tribal regions of the Himalayas. But increasingly, over the centuries, the ecstatic shaman has been replaced by the priestly Lama or ritual expert, and so later Bonpos in Central Tibet also came to fill a role more ritualistic than ecstatic.

Fig 177: An old photo of Bön shamans

Originally the word Bonpo meant someone who invoked the gods and summoned the spirits.

The history of the development of Bon may be divided into three phases:

1. Primitive Bon more or less corresponds to the archaic shamanism and paganism of ancient Northern and Central Asia. This shamanism is still practiced in its original and unreformed version in remote areas of the Himalayas, as well as on the borders of Tibet and China.
2. Yungdrung Bon or Old Bon (bon rnying-ma) was the high religious culture of the ancient kingdom of Zhang-zhung

which centered around Gangchen Tise or Mount Kailas in Western Tibet. This kingdom, which possessed its own culture and language and writing, maintained an independent existence long before the rise of civilization in Central Tibet in the seventh century with the coming of Indian Buddhism to that country.

3. New Bon (bon gsar-ma) was a deliberate and conscious amalgamation of the Bon of Zhang-zhung with the Buddhism of Indian origin, especially as this spiritual tradition was represented by the Nyingmapa school in Tibet. In the reformed Bon, one finds a monastic system, philosophy colleges, and a scholastic tradition and curriculum fully comparable to that found in the other schools of Tibetan Buddhism, especially the Nyingmapas. My Lama Yeshe Dorje with whom I took the Dharma vows was a Ningmapa exorcist and weather shaman. On the other side of the matter, many ancient Bonpo rituals and practices have been accepted into the Buddhist schools of Indian origin in Tibet and, in particular, as the cult of the Guardian spirits, the old pagan pre-Buddhist deities of Tibet who are now the protectors of the Dharma.

Fig 178: Lama dancing at Tikse monastery on our journey in 1976 illustrates the merging of Tibetan animism with Buddhism.

Furthermore, shamanism continues to be practiced in Tibet in its archaic form and such a practitioner is generally known as a Pawo (dpa'-bo) or Lhapa. This social function is clearly distinguished from that of the Lama or priest.

In general, the Pawo is characterized by spirit possession. After entering into an altered state of consciousness or trance induced through drumming and chanting, his or her consciousness principle known as the Namshe (rnam-shes) is projected out of the physical body through the aperture at the top of the skull into one of the three symbolic mirrors arranged on the shamanic altar. These three mirrors represent the gateways to the other worlds of the Lha (the celestial spirits), of the Tsen (the earth and mountain spirits), and of the Lu (the subterranean water spirits), respectively. These three types of spirit correspond to the three zones -- sky, earth, and underworld-- into which the world was divided in the ancient Bonpo shamanic cosmology.

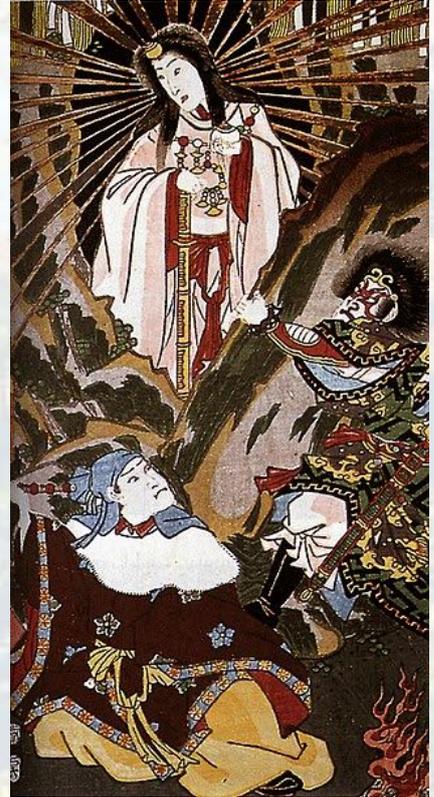

The Kami of Japanese Shinto

Shinto is polytheistic and revolves around the kami, supernatural entities believed to inhabit all things. The link between the kami and the natural world has led to Shinto being considered animistic.

Although historians debate at what point it is suitable to refer to Shinto as a distinct religion, kami veneration has been traced back to Japan's Yayoi period (300 BC to AD 300). Buddhism entered Japan at the end of the Kofun period (AD 300 to 538) and spread rapidly. Religious syncretisation made kami worship and Buddhism functionally inseparable, a process called *shinbutsu-shūgō*. The kami came to be viewed as part of Buddhist cosmology and were increasingly depicted anthropomorphically. In Japan, it has long been considered acceptable to practice different religious traditions simultaneously. Japanese religion is therefore highly pluralistic. The earliest written tradition regarding kami worship was recorded in the 8th-century *Kojiki* and *Nihon Shoki*.

Kami (Japanese: 神, [ka⁺mi]) (often taken to mean "gods", though the concept is more involved than that) are the spirits, phenomena or "holy powers" that are venerated in the religion of Shinto. They can be elements of the landscape, forces of nature, as well as beings and the qualities that these beings express; they can also be the spirits of venerated dead people. Many kami are considered the ancient ancestors of entire clans (some ancestors became kami upon their death if they were able to embody the values and virtues of kami in life). Traditionally, great or sensational leaders like the Emperor could be or become kami.

Fig 179: Amaterasu emerging from the cave, Ama-no-Iwato, to which she once retreated (detail of woodblock print by Kunisada).

In Shinto, kami are not separate from nature, but are of nature, possessing positive and negative, and good and evil characteristics. They are manifestations of *musubi* (結び), the interconnecting energy of the universe, and are considered exemplary of what humanity should strive towards. Kami are believed to be "hidden" from this world, and inhabit a complementary existence that mirrors our own: *shinkai* (神界, "the world of the kami"). To be in harmony with the awe-inspiring aspects of nature is to be conscious of *kannagara no michi* (随神の道 or 惟神の道, "the way of the kami").

When Amaterasu the sun goddess sent her grandson to earth to rule, she gave him five rice grains, which had been grown in the fields of heaven (Takamagahara). This rice made it possible for him to transform the "wilderness". The kami are not necessarily considered omnipotent or omniscient and can have flawed personalities and are capable of ignoble acts. In the myths of Amaterasu, she could see the events of the human world, but had to use divination rituals to see the future.

There are considered to be three main variations of kami: Amatsukami (天津神, the heavenly deities), Kunitsukami (国津神, the gods of the earthly realm), and *ya-o-yorozu no kami* (八百万の神, countless kami). ("八百万" literally means eight million, but idiomatically it expresses "uncountably many" and "all-around"—like many East Asian cultures, the Japanese often use the number 8, representing the cardinal and ordinal directions, to symbolize ubiquity.)

Fig 180: Amaterasu's cave Ama-no-Iwato

The word from Western philosophy that deals with the same concept is *numinous*, which has been variously

taken to mean both a subjective sense of spiritual awe and any entity that evokes that sense, indicating or suggesting the presence of a divinity.

Likewise, according to the Ainu of Hokkaido, spirits reside in all natural objects. Ainu regarded natural phenomena that are useful to human beings, including flora and fauna, as well as daily life necessities such as fire, water, living implements and forces beyond human control like the weather, as kamuy, and paid homage to them. Some kamuy are thought to cause diseases, earthquakes, thunder and other natural phenomena. In addition to these naturally occurring kamuy, man-made implements – boats, hearth hooks, mortar and mallets – are also believed to be kamuy. Some kamuy protect humans, so that they can live in safety. Others, such as fire, offer assistance beyond human ability and listen to humans' appeals and wishes that have to be conveyed to other kamuy. The fish owl is viewed as a kamuy whose role is to watch villages, and it is highly considered by the Ainu people. Some kamuy of plants have the power to keep evil spirits away. The term is equivalent to kami in Shinto.

Maori Maatauranga

Fig 181: Left: Papa and Rangi were locked in tight embrace. Centre: Tane Mahuta the Kauri world tree of Aotearoa – a tall Kauri - *Agathis australis*, up to 2000 years old. Right: Tumakoha, the Arawa Tohunga – priest, mystic, bard and genealogist, was the highest tohunga of the old religion in the Arawa tribe surviving in modern times.

Thanks-giving to Tane – Guardian of the World Tree

*At the beginning of time stood Te Kore, the nothingness - Io.
Then there was Te Po the Great Night,
the Long Night the intensely Dark Night,
the Gloom-laden Night the Night to be Felt, the Night Unseen.*

*Then Rangi the sky, dwelt with Papa tu a nuku the Earth,
and was joined with her, and land was made.
But their numerous offspring lived in darkness, for their parents were not yet parted,
the sky lay upon the earth and no light came between them,
and the land was unfruitful, and the sea was all dark water.*

*The war god Tu matauenga said "let us kill them",
but Tane mahuta, god and father of the forests
and all things that inhabit them answered
"No, not so. It is better to rend them apart,
and to let the Sky stand far above us
and the Earth lie below here.*

*Let the Sky become a stranger to us,
but let the Earth remain close to us as our nursing mother."
Over vast time, the Kauri pushed them apart.
With heavy groans and shrieks of pain,
the parents of the sons cried out
"Why did you do this crime,
why did you slay your parents' love?"*

For this section, I have chosen three short quotations to avoid misinterpreting the cultural translation. Maori history differs from many other ethnic cultures in that they have, despite colonial oppression, held their own. When Kawiti and Hone Heke in 1845 cut down the flagpole of British authority, reducing Kororareka the original colonial capital to smoking ruins. They later retreated into the forest where they perfected developing the art of trench warfare, 70 years before the First World War, holding the forces of the British Empire at Bay in a stalemate.

Fig 182: Hōne Heke with Te Ruki Kawiti and Hāriata Rongo (Alexander Turnbull Library, C-012-019).

Paul Moon (2013), commenting on criticism of Marama Muru-Lanning’s research on the Waikato river – *He piko, he taniwha* – as being unscientifically spiritual, notes the central place of animism in the Maori world view:

Animism is the belief that natural things and phenomena have a life force of their own. Māori would call this life force mauri. The pre-European Māori spiritual way of being was exactly, a belief that everything had a life force. Given that, our tīpuna (ancestors) practised animism every day of their lives. Christianity has not caused that belief to disappear among us; instead the two co-exist.

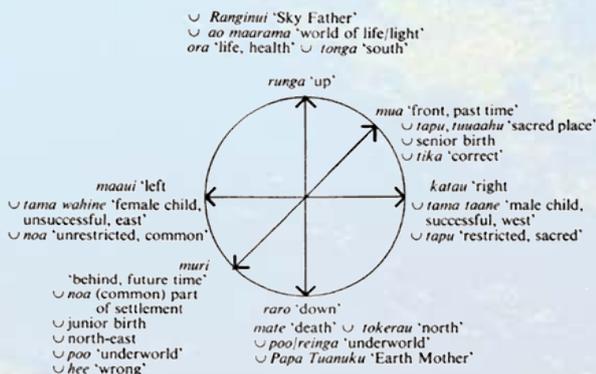

Fig 183: Taniwha – a Maori supernatural serpent. In the prehistoric age of early human occupation, nomadic Maori hunters created New Zealand’s earliest surviving artworks in caves and shelters as long ago as the fifteenth century or earlier. Then all of a sudden between 700 and 400 years ago, most of the east coast forests were destroyed in a series of huge, man made fires. The exact reason is heavily debated and will never be known. What is known is that the fires resulted in a razing of the habitat of many of the birds. A number of species including all the Moas became extinct. The areas formerly favoured for hunting and where many of the rock shelters occur, became barren and inhospitable (Narbey 2013).

Maori today are fully scientific about the preservation of their rivers, although treating them as living agents and have recently brought a class action suit against the NZ Government for allowing the farming sector to pollute them indiscriminately:

As a Nāti, I pay homage to Hikurangi, our ancestor mountain and to Waiapu our ancestor river. All (practising) Māori pay homage to a geographical feature as an ancestor. In paying homage to that ancestor we imbue it with a life force that goes beyond weather and geology. And although we understand how both those factors impact on that life force, in paying homage we assign a religious aspect to the geological feature that would otherwise not exist. However, Hohepa Kereopa qualifies that by saying mauri requires human intervention (Moon, 2003). That is without our reference to Hikurangi the mountain as an ancestor, or as in many other cultures speaking about a mountain as if it were alive, then the religious aspect is unlikely to be assigned. Let’s look at this aspect of assigning life to natural phenomena in the light of storms and environmental issues. A whole whakapapa on the naming of storms has grown over the years. We understand storms because we experience their beauty and their fury. And although we might also understand the science behind their existence, we are also likely to assign their existence as penance for wrong done – our lack of care of the environment for example. ... Having that connection to that mountain and river does not mean I will not take a scientific view. What it does mean is the scientific view I do take will be through the lens of being Māori.

Fig 184: Polarities in the Maori cosmos have parallels with the Shipibo cosmos (Salmond 1978).

Anne Salmond (1985) outlines Maori epistemology and the way Maori cosmology leads to an ongoing concept of knowledgable destiny in the pursuit of survival:

Maatauranga, or reliable knowledge, is a term in Maori almost synonymous with moohiotanga, knowledge acquired by

familiarity and the exercise of intelligence. A particular form of *maatauranga* is *waananga*, ancestral knowledge which enabled its possessor to communicate directly with the ancestor-gods and to activate their power. In this conception of the universe, men and women existed at a threshold or *pae* between sky and earth, life and death, light and dark, and exerted themselves to influence destiny. Just as Tane, the ancestor of humanity, forced earth and sky apart to create a world of light, growth, and life, so people worked through ritual to focus ancestral and essential power (*mana atua*), and to harness it for their survival: At moments when this power entered the phenomenal world it was said, 'Te ihi, te wehi me te wana!' (essential force, fearful force, awesome power!). Wild and extraordinary phenomena were attributed to the interventions of such power, and so were termed 'atua'; (god, supernatural being: anything strange and extraordinary). *Tohu* or omens, on the other hand, were predictive indicators of the workings of the phenomenal world, and *tohunga* (priests or knowledgeable experts) were the skilled interpreters of such signs. *Waananga*, or knowledge for activating ancestral power, included cosmological and ancestral histories—both expressed in a genealogical language of description since all matter proceeded from a common source; ritual practices; and *karakia* or formulae of power.⁵ This sort of knowledge was regarded as a family treasure (*taonga*).

The debate about the Maori world view *Maatauranga* and its relationship with the scientific world view continues to be hotly debated in 2021-2 (In defence of Science [NZ Listener](#) 2021 Jul 31 4, Aug 7 4, 18, 14 4-5, 28 6-7, 31 4-5, Sep 4 5-7, Dec 18 5, 2022 Jan 8 4, Mar 22 7, Apr 2 5), in the light of a decision resulting in both gaining a comparative status in the education system, attesting to the fact that in at least some parts of the world, the animistic view of life and nature can stand alongside physical materialism. The Maori party has recently petitioned that New Zealand be officially named *Aotearoa* – the land of the long white cloud – although this is already recognised as the country's name in our dual language system, although it is actually the Maori name for the North Island, attesting to the resurgence of a more long-lasting vision of cultural history than Western commercial materialism can lay claim to.

Fig 185: Screenshot from Ministry of Education website explaining changes to NCEA Maori is a Maori term. The website contains a Glossary which defines *mauri* as "The vital essence, life force of everything: be it a physical object, living thing or ecosystem. In Chemistry and Biology, *mauri* refers to the health and life-sustaining capacity of the *taiao*, on biological, physical, and chemical levels."

**BIG
IDEA**

Properties of matter are determined by attractive forces between particles

Mauri is present in all matter. All particles have their own *mauri* and presence as part of a larger whole, for example within a molecule, polymer, salt, or metal. When matter is broken into smaller particles each particle remains as part of the *taiao*, for example when a substance is burnt or dissolved the particles remain, with their own *mauri*. They do not just disappear.

James Cowan (1930), although an earlier colonial interpreter of Maori customs, spoke fluent Maori and has given an insightful historical view of Maori animism that carries with it the freshness of a first hand verbal account:

*The Maori-Polynesian religion, broadly stated, consisted in a reverence for the personified powers of nature, and a worship or propitiation of the spirits of ancestors. A belief in the animation of all nature pervaded and influenced the whole life of the Maori, and equally strong was his faith in the divinity of his great Ariki forefathers, ancestors who had long passed to the Reinga-land, yet whose spirits still held dominion over their descendants and were powerful to bless or ban. The Maori invested the elements and forces of the cosmos with names and human attributes; these and his revered dead stood to him for deities. That universal primitive religion which takes the form of animism is nowhere to be found more copiously embodied in priestly *karakia*, or ritual, and sacred legend than among the New Zealanders and the islands of Polynesia; and nowhere are ancestral spirits so venerated, their names held so sacred that their repetition is in itself a prayer. So carefully are the genealogies preserved that their recitation forms a large portion of many a *karakia*; any mistake in the repetition destroys the efficacy of the prayer or formula, and is even fatal to the suppliant.*

*There is much that is sublime in the ancient cosmogonies. The Maori could conceive of uncountable aeons of Chaos and primeval Darkness (*Po*), gradually giving place to light until the *Ao-māramai* the World of Light was evolved. Ages upon ages of Nothing (*Kore*), as the old *tohungas* recited, preceded the gradual Dawn of Life and the coming into being of the Heavens and the Earth. Many tribal genealogies go back to the source of all things, to the time when the world was "without form and void." The idea that seems most strongly to pervade the Maori mind, the conception that colours all his theories as to the origin of everything in nature, is the dual principle, the generative power of male and female, of the active and passive forces. Everything he endowed with sex, even the successive periods of Darkness and of Light, before man was. Light was to him the primal active generating force, operating upon *Po*, the Darkness, the passive, the receptacle for the mysterious Vivifier.*

*It was Tane-mahuta who forced his parents apart by standing on his head and thrusting Rangi upwards with his feet. Tane's limbs were the trees; it was with these forest-pillars that he propped up the leaning sky, so that the Sky-Parent henceforth dwelt on high, dropping down his tears on Papa's face in the form of rain and dew. "Tears" are a poetic euphemism for the procreating and fecundative powers of the Sky, the Clouds, the Rain, and the Sun. These potent influences Rangi showers upon his spouse the Earth, who in return brings forth abundantly of all plants and trees and foods, and who ever exhales her tokens of love or *aroha* in the form of mists and soft clouds. These vapours of *aroha* are night after night wafted on high to her Sky-Husband, her Tane, whose face and*

breast are so grandly adorned with myriads of stars. Papa (a term interchangeable, as word-students know, with the equally universal "mama"), is the all-nourishing, all begetting one, the great Mater Genetrix.

Beyond and above the personification of natural forces and objects, the Earth, the Ocean, the Wind, the Sun and Moon and Stars, there was the belief in a Great First Cause. This supreme being is Io, a name exceedingly sacred and not to be mentioned lightly. "Io was really the God," says a Maori. The protection or shelter of Io ("Te Maru a Io"), is an expression in an ancient prayer. In a Ngati-Porou (Takitimu) cosmological recital, written for me by an old chief, Io is coupled with Hā as one of the two high deities. Hā, however, means the breath of life, the vivifying force. Io may be from the original iho, the core, the animating force of all things.

"The was Io-matua, the meaning of which is, that he was the parent of all things; in the heavens or in the worlds. His second name was Io-mata-ngaro [Io-the-hidden-face], which name means that he is never seen by man. His third name is Io-mata-aho [Io-seen-in-a-flash], so called because he is never seen except as in a flash of light or lightning. A fourth name is Io-tikitiki-o-rangi [Io-exalted-of-heaven], called so because he dwells in the highest and last of the heavens. A fifth name is Io-nui [Io-the-great-god], because he is greater than all the other gods that are known as dwelling in the heavens or the earth.

Nature-worshipper as the Maori was, everything was personified—the trees, the streams, the rain and dew, the mist and sunshine. He had deep respect for the forest of tall timbers—the "Vast and Holy Woods of Tané." In the fogs that rose like fleecy wraiths from the rivers and the swamps were the Hau-Maringiringi, the dewy children of Rangi and Papa. These, too, were the divine offspring of the Sky-Father and Earth-Mother: Hau-nui and Tomairangi the dew; Tane-uarangi, the heavy rain; Hau-maroroto, rain in big drops; and the grateful warmth of midsummer days was the Tou-a-Rangi. Besides the great deities, the seven of Rangi and Papa, there were the innumerable lesser deities of the Maori pantheon, a vast company of atua, to whom invocations and propitiatory incantations were addressed; atua of earth and sky, of cultivation and food, of fishing and seafaring, of the forests and waters, and particularly of war. These were in general deified beings of mortal origin. Amongst a people whose great glory was in battle, deities of war held high place. Each tribe had its war-god, and each god had its kaupapa or medium.

However the Amazonian peoples, the Northern Ojibwa, the Maori and the trafficked Nayaka are highly evolved migratory ethnic groups, so it is pertinent when considering the ancient origins of animism to look back to our founding human cultures to see how animism figures in their societies and cultural practices.

The Khonds of India

Khonds (Kondha and Kandha) are an indigenous Adivasi tribal community in India. Traditionally hunter-gatherers, they are divided into the hill-dwelling and plain-dwelling Khonds, but the Khonds themselves identify by their specific clans. Khonds usually hold large tracts of fertile land, but still practice hunting, gathering, and slash-and-burn agriculture in the forests as a symbol of their connection to, and as an assertion of their ownership of the forests wherein they dwell. They commonly practice clan exogamy. By custom, marriage must cross clan boundaries (incest taboo). Marriages are made outside the clan (yet still within the greater Khond population). Acquiring mate is often by negotiation. However, marriage by capture or elopement is also rarely practiced. Bride price is paid to the parents of the bride by the groom, which is a striking feature. It was traditionally paid in tiger pelts though now land or gold are usual.

Traditionally Khond religious beliefs were syncretic, combining totemism, animism, ancestor worship, shamanism and nature worship. British writers also note that the Khonds practiced human sacrifice. Traditional Khond religion involved the worship mountains, Rivers, Sun, Earth. Baredi is place of worship. Traditional Khond religion involved different rituals. Matiguru involved worship of earth before sowing seeds. Other rituals connected with land fertility were 'Guruba Puja', 'Turki Puja' and in some cases 'Meriah Puja (human sacrifice)' to appease Dharni (earth), goats and chicken. Pitabali Puja was performed by offering flowers, fruits, sandal paste, incense, ghee-lamps, ghee, sundried rice, turmeric, buffalo or a he-goat and fowl.

Human sacrifice has always been prevalent in India, especially in the worship of Kali, but Joseph Campbell (1962 160) gives a particularly graphic portrait of the Khonds:

"A vivid typical lesson is supplied, for example, by the Khonds ... who had victims known as meriah, set apart and often kept for years, who were offered to the Earth Goddess, Tara, to ensure good crops and immunity from disease. To be acceptable, such a figure had to have been either purchased or else born as the child of a meriah. The Khonds, according to report, occasionally sold their own children for this sacrifice, supposing that in death their souls would be singularly blessed. ... They were regarded as consecrated beings and treated with extreme affection and respect, and were available for sacrifice either on extraordinary occasions or at the periodic feasts, before the sowing; so that each family in the village might procure at least once a year a shred of flesh to plant in its field for the boosting of its crop"

"Ten or twelve days before the offering, the victim was dedicated, shorn of his hair, and anointed with oil, butter, and turmeric. A season of wild revelry and debauchery followed, at the end of which the meriah was conducted with music and dancing to the

meriah grove, a little way from the village, a stand of mighty trees untouched by the axe. Tied there to a post and once more anointed with oil, butter, and turmeric, the victim was garlanded with flowers, while the crowd danced around him, chanting, to the earth: 'O Goddess, we offer to thee this sacrifice; give to us good seasons, crops, and health'; and to the victim: 'We bought thee, with a price, we did not seize thee, and now, according to custom, we sacrifice thee: no sin rests upon us.' A great struggle to secure magical relics from the decorations of his person flowers or turmeric-or a drop of his spittle, ensued, and the orgy continued until about noon the following day, when the time came, at last, for the consummation of the rite".

Fig 186: Khond women and elders, a marriage ring, sacrifice post, and human sacrifice.

"The victim was again anointed with oil ... and each person touched the anointed part, and wiped the oil on his own head. In some places they took the victim in procession round the village, from door to door, where some plucked hair from his head, and others begged for a drop of his spittle, with which they anointed their heads. As the victim might not be bound nor make any

show of resistance, the bones of his arms and, if necessary, his legs were broken; but often this precaution was rendered unnecessary by stupefying him with opium. The mode of putting him to death varied in different places. One of the commonest modes seems to have been strangulation, or squeezing to death. The branch of a green tree was cleft several feet down the middle; the victim's neck (in other places, his chest) was inserted in the cleft, which the priest, aided by his assistants, strove with all his force to close. Then he wounded the victim slightly with his ax, whereupon the crowd rushed at the wretch and hewed the flesh from the bones, leaving the head and bowels untouched. Sometimes he was cut up alive. In Chinna Kimedy he was dragged along the fields, surrounded by the crowd, who, avoiding his head and intestines, hacked the flesh from his body with their knives till he died".

"Another very common mode of sacrifice in the same district was to fasten the victim to the proboscis of a wooden elephant, which revolved on a stout post, and, as it whirled round, the crowd cut the flesh from the victim while life remained. ... In one district the victim was put to death slowly by fire. A low stage was formed sloping on either side like a roof; upon it they laid the victim, his limbs wound round with cords to confine his struggles. Fires were then lighted and hot brands applied, to make him roll up and down the slopes of the stage as long as possible; for the more tears he shed the more abundant would be the supply of ram. Next day the body was cut to pieces. ... Each head of a house rolled his shred of flesh in leaves, and buried it in his favourite field, placing it in the earth behind his back without looking".

The Khonds gave highest importance to the Earth goddess, who is held to be the creator and sustainer of the world. The gender of the deity changed to male and became Dharni Deota. His companion is Bhatbarasi Deota, the hunting god. To them once a year a buffalo was sacrificed. Before hunting they would worship the spirit of the hills and valleys they would hunt in lest they hide the animals the hunter wished to catch.

In Khond society, a breach of accepted religious conduct by any member of their society invited the wrath of spirits in the form of lack of rain fall, soaking of streams, destruction of forest produce, and other natural calamities. Hence, the customary laws, norms, taboos, and values were greatly adhered to and enforced with high to heavy punishments, depending upon the seriousness of the crimes committed. The practise of traditional religion has almost become extinct today.

Pygmy Cultures and Animistic Forest Symbiosis

The Mbuti and Biaka/Aka/Baka pygmies both practice forms of animism giving expression to a deeply symbiotic relationship with the forest in which they live. The Mbuti share significant ancient characteristics with the Bushmen and form the largest single group of pygmy hunters and gatherers in Africa (Sanday 1981 93). Around 2250 BC the Egyptian pharaoh Nefitare referred to the Mbuti as 'the people of the trees' renowned for their singing and dancing. These records support the Mbuti remaining stably in this habitat for 4000 years. Because of fission into small isolated groups they have lost their original language and adopt those of neighbouring Bantu tribes, however the Biaka have

retained their native language, diaka, as well as speaking the language of their Bantu neighbours. Neither group have formally defined sex roles. Sexual relations are extremely egalitarian and cooperative. Both groups practice net hunting which involves both sexes young and old promoting a non-violent egalitarian culture.

According to Wilhelm Schmidt (1868–1954), an ordained priest and ethnologist interested in the origin of religion, the Pygmy peoples represented humanity in its childhood; they were a living equivalent of one of the earliest stages of human culture. Since early evidence seemed to indicate the existence of monotheistic belief in primitive societies, for years the Pygmies were studied by Catholic missionaries seeking to support the idea that monotheism (rather than animism or fetishism) was the earliest form of religion. The Jesuit missionary anthropologist Paul Schebesta (1887-1967) claimed the Mbuti believed that God, Muungu, a high deity, created the universe (that is, the forest) and all its creatures and forces. God then retired into the sky, ending his participation in earthly affairs. The first human, a culture hero named Tore, became god of the forest; he gave the Mbuti both fire and death and is seen as the source of game, honey, and protection. Likewise the Aka believe in bembe, the creator of all living things, but they believe also that bembe retired soon after creation. Religion in the lives of tropical forest foragers has thus increasingly reflected borrowings from neighboring African groups and from colonial missionary influences.

Colin Turnbull (1965) the major ethnographer of the Mbuti, disagrees with this theistic account of Mbuti cosmology. According to him, there is no creator god; instead, the Mbuti worship God as a living benevolent being personified by the forest. To them, God is the forest.

Tropical forest foragers believe in totemic spirits (*sitana*) - animals whose spirits and characteristics represent the group's unity. They also believe in a water animal, called *nyama ya mai* in Swahili, who is responsible for any serious water accidents. Tropical forest foragers also practice magical rituals called anjo to help control the weather and improve hunting. Turnbull also diverges from Schebesta's account of the mediating forest spirits, for he views the Mbuti as a practical people who have a direct relationship with the forest as sacred being, so unlike their neighbours they are not centrally concerned with propitiating "magic" as an effect, but for the pygmies, it is not so much the act itself that counts, but the manner in which the act is performed and the thought that goes with it.

Fig 187: Mbuti (left) and Biaka Pygmies (right) including a man tending Tabernanthe iboga for visionary experience.

Their habitat and their heaven is the Ituri Forest. The forest is their godhead, and different individuals address it as 'father', 'mother', 'lover', and/or 'friend'. They say that the forest is everything: the provider of food, shelter, warmth, clothing, and affection. Each person and animal is endowed with a spiritual power that "derives from a single source of power whose physical manifestation is the forest itself". Disembodied spirits deriving from this same source are also considered to be independent manifestations of the forest. The forest lives for the Mbuti. It is both natural and supernatural, something that is depended upon, respected, trusted, obeyed, and loved. The forest is a good provider. At all times of the year men and women can gather an abundant supply of mushrooms, roots, berries, nuts, herbs, fruits, and leafy vegetables. The forest also provides animal food.

Decision making is by common consent: Men and women have equal say because hunting and gathering are both important to the economy. The forest is the ultimate authority. It expresses its feelings through storms, falling trees, poor hunting all of which are taken as signs of its displeasure. But often the forest remains silent, and this is when the

people must sound out its feelings through discussion. Diversity of opinion may be expressed, but prolonged disagreement is considered to be 'noise' and offensive to the forest.

The most important ritual ceremony is the molimo. It is held whenever hunting becomes unproductive or a special problem demands a solution. Explaining to Colin Turnbull the reason for the molimo ceremonies, held when the Mbuti feel that all is not well between themselves and the forest, upon which they depend for everything, an old Mbuti man said: "The forest is a father and mother to us and like a father or mother it gives us everything we need food, clothing, shelter, warmth . . . and affection". Normally everything goes well because the forest is good to its children, but when things go wrong there must be a reason. Things go wrong, the old man said, at night when the people are asleep, when no one is awake to protect humans from harm. At night army ants may invade the camp or leopards may come in and steal a hunting dog or even a child. The old man said that such things would not happen when people are awake. Thus, he reasoned, "When something big goes wrong, like illness or bad hunting or death, it must be because the forest is sleeping and not looking after its children." Because things go wrong when the forest is 'asleep,' the forest must be 'awakened' so that it looks after the interests of the people. The old man said: "We wake it up by singing to it, and we do this because we want it to awaken happy. Then everything will be well and good again. So when our world is going well then also we sing to the forest because we want to share our happiness.

An old man told Colin Turnbull how all pygmies have different names for their god, but how they all know that it is really the same one:

Just what it is, of course, they don't know, and that is why the name really does not matter very much. 'How can we know?' he asked. 'We can't see him, perhaps only when we die will we know and then we can't tell anyone. So how can we say what he is like or what his name is? But he must be good to give us so many things. He must be of the forest. So when we sing, we sing to the forest.'

The most consistently mentioned divinity or spirit for the Aka is likewise that of dzengi, a forest spirit. Aka male-female relations are extremely egalitarian by cross-cultural standards. Husband and wife are together on a regular basis to net hunt, collect caterpillars, termites, honey, fruit, and sometimes fish. On net hunting days husband and wife are within view of each other about half of the time. Aka fathers do more infant care giving than fathers in any known culture. The Aka are fiercely egalitarian and independent. No individual has the right to coerce or order another individual to perform an activity against his/her will. Even when parents give instructions to their children to collect water or firewood, there are no sanctions if they do not do so.

San Bushmen as Founding Animists

Foundational human cultural influences can be seen in the animistic, spiritual and religious beliefs of our oldest surviving culture of the San Bushmen, a founding human culture, in genetic, evolutionary and archaeological terms, whose historical presence goes back over 100,000 years and whose ancestor, the mitochondrial Eve is literally the "mother of all living" (Fielder & King 2017). Although over the course of the last two millennia, the San may have had contact with other religious influences, their cosmology of animistic trickster heroes and deities have a fresh natural quality, just as engaging as the Sabbatical creation.

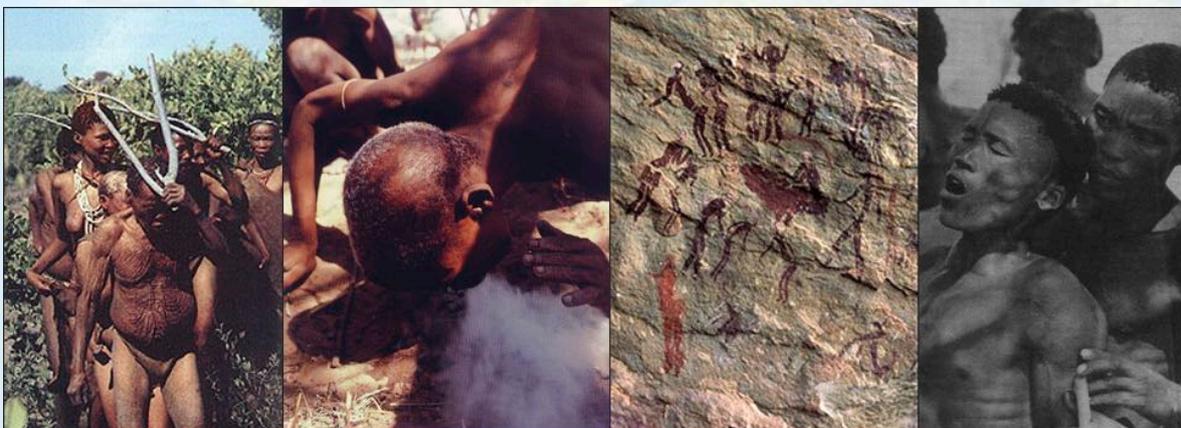

Fig 188: San headman acting as the Eland in the San rite of menarche for a teenage girl, smoking dagga (cannabis) from a hole in the ground, cave drawing of the trance dance and a person supported while entering trance in the rite – Lonyana Rock Kwazulu-Natal. Figures dance around a seated figure healing another reclining person enveloped in a kaross, or short skin-cloak.

(Rock Art Res. Inst., Univ. of the Witwatersrand, SA)

The San Bushmen, who represent one of our oldest and longest surviving foundational cultures likewise have an extensive history of animism. Sources of such material can be found in Laurens van der Post and Jane Taylor's (1986) *Testament to the Bushmen*, Johnson, Bannister and Wannenburg's (2000) *The Bushmen* (2000), Alan Barnard's (2019) "Bushmen: Kalahari Hunter-Gatherers and Their Descendants" and Mathias Guenther's (2020) "Human-Animal Relationships in San and Hunter-Gatherer Cosmology".

Guenther notes that the spirit realm, while preternatural (beyond what is normal or natural) in a number of ways, is also of this world, being located somewhere beyond the hunting ground and accessible, by different pathways, to humans, especially shamans. It may also be situated within the sky, rather than the veld, or somewhere in-between, in lower-sky regions, the spatial-ontological domain within which, preindustrial people tend to locate spirits as gods at eye-level – thereby rendering them ontologically ambiguous "supernatural beings whose ancestry is neither unequivocally human nor divine".

Xam story teller /Han#kasso's statement to Lucy Lloyd is as fundamental a postulate about human and animal ontology to San cosmology as is its reverse, Darwinian, counterpart to Western cosmology. Its clearest expression is found in the stories San tell about myth time, the First Order of Existence, whose denizens, for the most part, were therianthropes, that is, animals that "were once people". As such, these people—the Early Race — contained in their being, their First Order human'ness and elements of their Second Order animal'ness. Humans and animals from both myth and historical time are thus blended ontologically, explaining why, as we will see in the second section, we also find therianthropes, of a mythic, Early Race cast, in the Second Order of Existence.

These human animal transformations tally closely with the trickster hero /Kaggen or mantis – a human-insect-bird being – "a little green thing" that "looks like a long thin Locust", at times spreading its feathered wings and fly off, after a scrape or misadventure. Mantis's sister then berates him for his dereliction of duty. Unlike Mantis's other sister, Blue Crane, the sister here featured is of indeterminate nature her springbok child suggests that she is, springbok-linked. Mantis's nephew, the Little Springbok, has human speech, as, at the beginning of the story, he is engaged in animated prattle with Mantis, in a tone different from the hectoring he always gets from his own grandson, a precocious Ichneumon Lad, whose mother is a Porcupine woman and whose father's family are Meerkat and Lion People.

Fig 189: Therianthrope transforming from human to antelope (Guenther).

For the Bushmen of Lesotho, Mantis or, /Kaggen, the first being, made all things by ordering them to appear. He created the Sun, Moon, Stars, wind, mountains and animals. A quarrel began between /Kaggen and his wife Coti over a knife she made blunt by using it to sharpen her digging stick. As a result of his anger, she gives birth to an eland calf in the fields. /Kaggen leaves the calf in the bush while he goes away for three days to obtain arrow poison, his two sons find the calf and kill it for food. /Kaggen accuses his sons of 'spoiling' the eland. He instructs his sons to put the blood of the calf in a pot and churn it with a stick. The blood splatters and becomes snakes. They try again, and the blood that is spilled turns into hartebeest. /Kaggen is still not satisfied. He orders his wife to clean out the pot and to bring fresh blood from the paunch of the little eland. To this he adds fat from the heart, and when the blood splatters this time, each drop becomes an eland bull, and all the bulls surround /Kaggen and his sons and menace them with their horns. 'See how you have spoilt the elands,' says /Kaggen, and he chases them away. The next time the blood is churned it produces eland cows, in such numbers that the earth is covered with them. 'Now go and hunt them and try to kill one', says /Kaggen. 'That is now your work, for it was you who spoilt them.' But they fail, and so /Kaggen himself goes out and spears three bulls. Thereafter, with his blessing, his sons are also successful. Some myths speak of regeneration. The mythical Mantis, in his human person as one of the 'early race', finds that his grandson has been killed by baboons, who are playing a ball game with the child's eye. Mantis joins in the game and, gaining possession of the eye, places it in a pond, where it once more becomes the complete child, the grandson whom the baboons had killed.

Richard Katz (1982) gives a detailed account of the !Kung San trance dance reported first hand during his field work. This provides both numinous consciousness expansion for the practitioner to enter the spirit worlds and is also a process strengthening the community:

For the !Kung, healing seeks to establish health and growth on physical, psychological, social, and spiritual levels: it invokes work on the individual, the group, and the surrounding environment and cosmos. Healing is a fundamental integrating and enhancing force far greater than curing or the application of medicine. The healing tradition supports the culture's emphasis on sharing and egalitarianism, its belief in the life of the spirit, and its strong community ties.

The central event in the healing tradition is the all-night dance. Four times in a month, on the average, the women sit around the fire, singing and rhythmically clapping as night falls, signalling the start of a healing dance. The men, sometimes joined by the women, dance around the singers; the entire village participates. As the dance intensifies, *n/um*, or energy, is activated in those who are healers, most of whom are among the dancing men. As *n/um* intensifies in the healers, they experience an enhanced consciousness called *!kia* during which they heal all those at the dance. The dance usually ends before the sun rises the next morning. Those who are at the dance confront the uncertainties and contradictions of their experience, attempting to resolve issues dividing the group, reaffirming the group's spiritual cohesion. They find it exciting, joyful, and powerful. "Being at a dance makes our hearts happy," the !Kung say. While experiencing *!kia*, one can heal. Those who have learned to *!kia*-heal are said to possess *n/um*. They are called *n/um k"ausi* – "masters of *nium*" or simply "healers." *N/um* resides in the pit of the stomach and the base of the spine. As the healer dances, becoming warm and sweating profusely, the *n/um* heats up, becomes a vapor, and rises up the spine. When it reaches the base of the skull, *!kia* results.

Kinachau, an experienced healer, talks about the *!kia* experience:

You dance, dance, dance. Then n/um lifts you up in your belly and lifts you in your back, and then you start to shiver. [N/um] makes you tremble, it's hot. Your eyes are open but you don't look around; you hold your eyes still and look straight ahead. But when you get into !kia, you're looking around because you see every thing, because you see what's troubling everybody ... n/um enters every part of your body right to the tip of your feet and even your hair.

N/um is held in awe, considered very powerful and mysterious. It is this same n/um that the healer "puts into" people in attempting to cure them. Once heated up, n/um can both induce !kia and combat illness. ...But it is only as one learns to control or regulate one's boiling n/um that one can apply it to healing. One then learns to ≠twe, to "pull" or "pull out sickness." K"au ≠Dwa, a powerful healer, describes how one can heal while experiencing !kia: "When you !kia, you see the things you must pull out, like the death things god has put into people ... you see people properly, just as they are ... your vision does not whirl." !Kia intensifies emotions, be they fear, exhilaration, or seriousness. During !kia, !Kung healers perform cures, and as part of their effort to heal, may handle and walk on fire, see the insides of peoples' bodies and scenes at great distances from their camp, or travel to god's home, activities never attempted in their ordinary state.

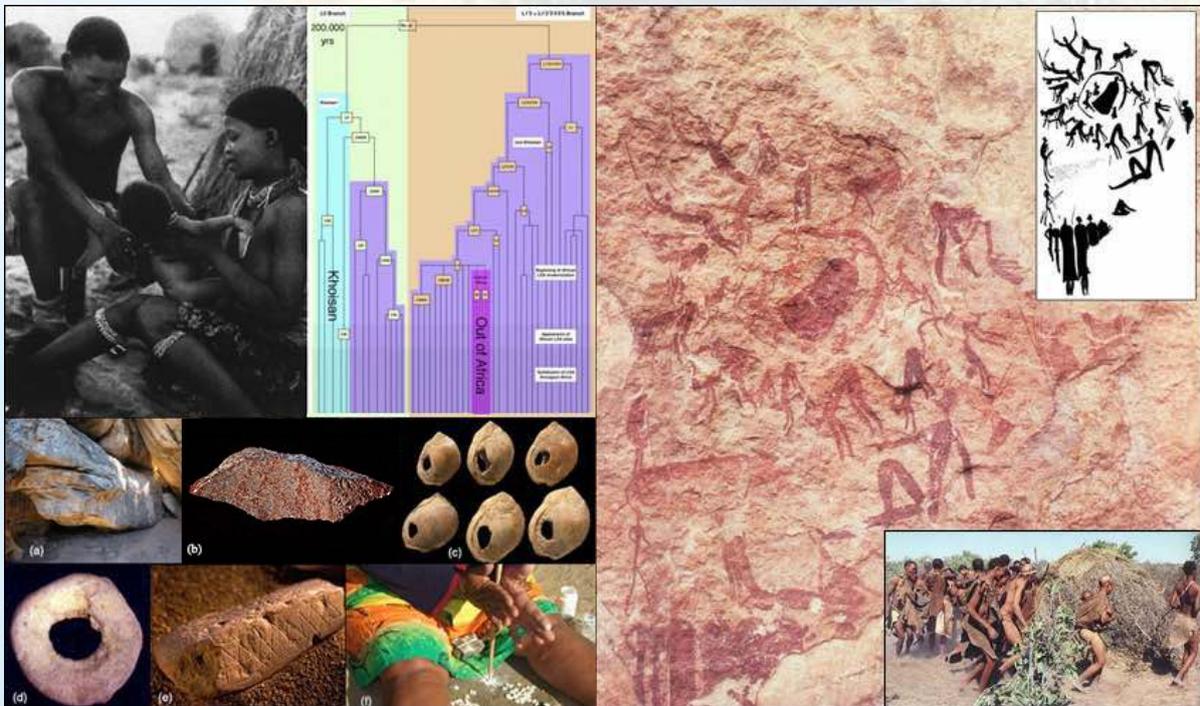

Fig 190: Left: A young San couple. Mitochondrial tree of humanity traces its oldest ancestor to an ancestral San female and shows evidence of the separation of San into two groups some 140,000 years ago for some 100,000 years, possibly by a long drought in the Kalahari. Remains from caves in the San area such as Blombos and the Border cave show cultural and spiritual use going back up to 100,000 years, painted stone fleck (73,000 years) representing the oldest human rock art, shell ornaments and scored red ochre possibly for cosmetic use. Right: Fulton cave drawing 1000 BC celebrating the eland rite of menarche, Drakensberg Mountains. The young woman is held in great reverence (Fielder & King 2017). Inset An eland rite with the headman impersonating the eland bull follows the same pattern as in the cave drawing.

≠Toma Zho, a strong experienced healer, speaks of the feeling !kiam gives, that of becoming more essential, more oneself:

I want to have a dance soon so that I can really become myself again." A transcendent state of consciousness, !kia alters a Kung's sense of self, time, and space. Another experienced healer says: "When I pick up n/um, it explodes and throws me up in the air and I enter heaven and then fall down.

!kia makes others feel they are "opening up" or "bursting open, like a ripe pod." Through !kia, a !Kung transcends ordinary life and can contact the realm of the gods and the spirits of dead ancestors. Sickness, incipient in everyone, is a process in which these spirits (the //gawasi) try to carry people off into their own domain.

In addition to their trickster heroes and first person experience of the numinous in the trance dance, the Bushmen also, possibly influenced by interactions with other cultures, believe in the existence of two gods: a greater god manifesting the creative force and a lesser god invoking the malevolent forces of uncertainty and misfortune, each with a shadowy consort (Johnson et al 2000, van der Post 1986). They have many names, but the !Kung Bushmen most commonly call them ≠Gao!na and //Gauwa, while to the /Gwi they are N!odima and G//awama. The Bushmen do not see these as opposed good and bad gods like Jehovah and Satan.

≠Gao!na, the !Kung Great God, using one of his seven divine names, created himself:

*"I am Hishe. I am unknown, a stranger. No one can command me.
I am a bad thing. I follow my own path."*

Then ≠Gao!na created a Lesser God who lives in the western sky where the sun sets; and after this two wives for himself and for the Lesser God. ≠Gao!na, tallest of the Bushmen, was in his earthly existence a great magician and trickster with supernatural powers, capable of assuming the form of an animal, a stone or anything else he wished, and who changed people into animals and brought the dead back to life. But as the Great God who lives beside a huge tree in the eastern sky, he is the source and custodian of all things. He created the earth with holes in it where water could collect and water, the sky and rain both the gentle 'female' rain and the fierce 'male' rain thunder and lightning, the sun, moon, stars and wind. He created all the plants that grow on the earth. He created the animals and painted their individual colours and markings, and gave them all names. Then came human beings, and he put life into them; and gave to them all the weapons and implements they now have, and he implanted in them the knowledge of how to take all these things for themselves. Thus their hunting and gathering way of life was ordained from the very beginning and ≠Gao!na ordained that when they died they should become spirits, //Gerai, who would live in the sky with him and serve him. He set the pattern of life for all things, each in accordance with its own rules.

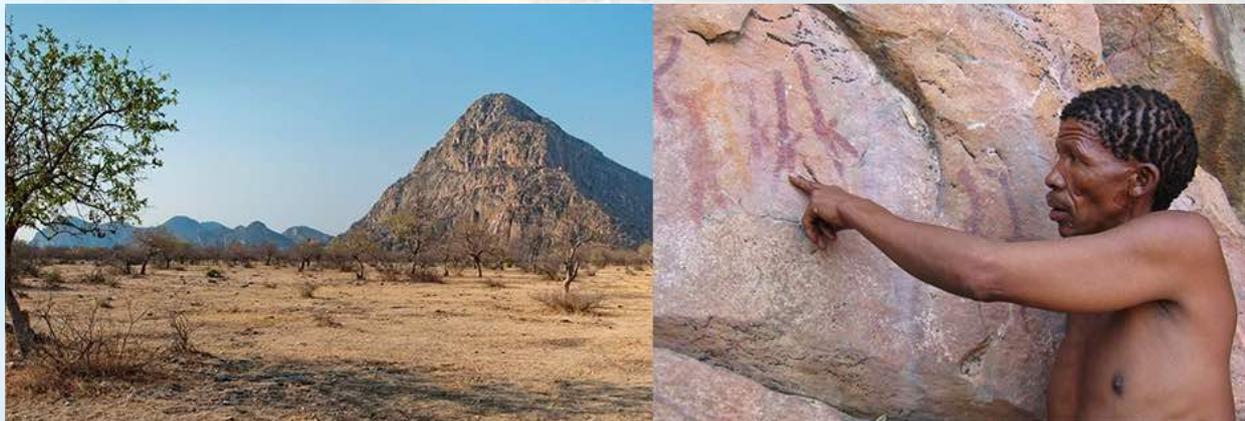

Fig 191: ≠Gao!na is said to live in the sacred Tsodilo Hills whose sexual story is a legendary comment on !Kung sexual relations. A man had two wives, but he loved one wife more than the other, and this caused a big quarrel. The one he didn't love hit him on the head, causing a deep wound. Then she ran off into the desert. But the Great God, ≠Gao!na, decided that because there was no peace among them, he must turn them all into a stone. The man became the largest of the hills; the unloved wife became the smallest hill that stands alone; and the loved wife, with her children, became the cluster of hills in the middle. But they believe there are supernatural powers in the Hills because ≠Gao!na himself lives there. It was there that he created and kept his cattle, sheep, goats, and all sorts of different animals. The !Kung claim you can see footprints in the rocks.

The !Kung pray to ≠Gao!na not as a remote being, but as intimately involved with their lives, sometimes calling him father. They pray for rain, for success in hunting, for healing both of physical and social ills. Only a really great medicine man might see ≠Gao!na face to face, but this is said to be very rare; much more frequently he may appear to anyone in a dream to encourage or advise. He does not reveal himself to ordinary humans, for so great is his power that, were he

to come too close, he would destroy them unintentionally. But he nevertheless retains an interest in them. He is in no way concerned with their misdeeds, but is aware of them, and if they offend him he will deal with them appropriately.

But he is not a god of vengeance. When he deals harshly with someone, it is not an act of retribution but a demonstration of his power. This is the power of the unknown, the 'stranger', which explains why lightning strikes one man dead, and not the other standing beside him. The dead man, it is reasoned, must have offended ≠Gao!na by referring to him by one of his divine names, or perhaps he abused food. But he is not continually on the look-out for offenders. It is only when they happen to come to his attention that he demonstrates his power, and so sometimes people do offensive things and get away with it. Chiefly he acts for the benefit of mankind, for he supplies rain, food, children and poison for the arrows.

//Gauwa, the lesser god, who lives between two great trees in the western sky, also performs deeds that may be either beneficial or harmful to humans, but most are harmful. He is pictured as a very small Bushman, an incompetent who, even when well-intentioned, may bring misfortune by mistake. Although he is supposed to be subservient to ≠Gao!na and to act at his behest, he also sometimes acts on his own initiative while travelling about in a whirlwind, causing sickness and death to those he touches in passing. The people say that at certain times they catch glimpses of //Gauwa among the shadows of the trees.

Fig 192: Nisa

*When the gods gave people sex, they gave us a wonderful thing.
Sex is food: just as people cannot survive without eating,
hunger for sex can cause people to die. !Kung saying - Nisa.*

In "Nisa" (1981) Marjorie Shostak provides an engaging detailed portrait of a !Kung San woman, her sexual relationships with men and her trials of familial life. What emerges from this account is the life of a spirited woman who throughout struggles to maintain her autonomy of choice over her life in a nominally patriarchal society in which the headmen would like to assert a patriarchal imperative, but in which the society has remained remarkably free of the oppressive influences of civilisation succeeding the agricultural revolution which itself was discovered by female gatherers, thus having remarkable similarities to features of sexual relations Western society is only recently re-engaging. We cannot thus assume that history dictates the dominance of patriarchy.

There is an obvious evolutionary rationale for animism in Gatherer-Hunter society, in that reality is formulated in relationships spanning family and kinship and coexistence with nature in both the gathering and hunting phases of securing nutrition and health. Hunting particularly as it is done by the San is a silent cooperative act of communal stealth by a band of hunters using expert arrow poisons. Central in successful hunting is adopting the persona of the hunted animal to identify with its habits and movements and temperament as closely as possible. Good hunting is critical to a man's success as it is key to gaining sexual favours, and indeed 19th century Hottentot Bushmen were reported to have been forced to steal cattle to satisfy their women's demands for meat as the colonists invaded their natural domains:

"The Bushmen when they will not go out to steal cattle, are by the women deprived of intercourse sexual by them and from this mode of proceeding the men are often driven to steal in opposition to their better inclination. When they have possessed themselves by thieving a quantity of cattle, the women as long as they exist appear perfectly naked without the kind of covering they at other times employ."

This power of identification with the animal is manifest in the eland dance in which a girl's menarche is celebrated as a pivotal spiritual event in which the headman taking the role of the eland leads the young warriors in a dance around the hut where the girl is secluded, so that they cannot set eyes on her for fear that it will disturb their hunting prowess. The gatherer-hunter existence is aimed at securing a diverse diet in a few enough hours of the day to enable social concourse, and non-disruption of the ecosystem, taking only what one needs from the environment in a way which sustains the abundance of nature, preserving the biosphere.

Because the Bushmen have historically existed in small bands, and cannot survive as individuals, they have an immediate sense of "morality" to deal with immediate threats to group unity, which applies particularly to sharing and stealing, but this in no way extends to any form of absolute "cosmic" morality. Two customs are especially important

are meat-sharing and gift-giving. Mannerliness, the custom of talking out grievances, the customs of borrowing and lending and of not stealing simply function to prevent tension from building up dangerously between members of a group and help to bring about peaceful relationships.

If a !kung woman steals, we take hold of her, we give her to her mother and her father; and they all go away from their place. Her stolen thing, we take it, we run, we run to give to the other person the other person's thing. And we say to the other person: "My wife stole your thing which is here; your nice thing here, my wife stole. And I have given (back) my wife to her father and her mother. For, my wife stole the nice thing here." And the other person hears, and objects (saying): "No; kill thy wife." And, we hear, (and) object (saying): "No; I do not listen to you, and will not kill my wife; for, my wife has gone away, has gone to her father and her mother; and is far away; and has gone to her country; and I will not kill my wife." And the others cry, and we hear; and our hearts ache, and we go away; we say to the other people: "We go away; come, that I may kill my wife, kill my father-in-law, kill my mother-in-law, kill my ..."

There is no 'government' to keep men in awe, no impersonal authority to decide who is right and who is wrong. Thus although their homicide rates have been much lower than warrior societies, men still will commit murder. As one of the !Kung men in an argument about a marriage put it to his adversary, their dispute could be quickly settled with an arrow. Just one little [poisoned] arrow!

But this doesn't mean absolute morality either:

When a missionary inquired into a Bushman's ideas of good and bad he was told it was 'good' to sleep with another man's wife, but 'bad' if he slept with yours. Still lamenting the Bushman's ignorance of absolute morality, he later asked the man, whom meanwhile he had discovered 'was in the habit of smoking wild hemp', what he thought was the most wonderful thing he had seen. The reply he was given, that no one thing was more wonderful than any other and that all the animals were the same.

There is no suggestion that the carnivores are "bad" or "immoral" for eating the herbivores, or should lie down with the lamb and eat straw, as arises in Isaiah 11.

In the ≠Gao!na creation account above, unlike the Vedic tale of Valmiki who created the Ramayana as penance for cursing a hunter who killed a bird, the hunting of animals is ordained from the very beginning by God as the gatherer-hunter way of life, so killing animals for food cannot be regarded as natural evil. The Gods are NOT moral arbiters. ≠Gao!na the creator says he is a bad thing because he follows his own path and //Gauwa the god of misfortune is not evil. Neither do they control men's and women's lives through absolute morality or divine punishment.

Geunther notes that, despite the advent of the new anthropological climate, this largely bypassed studies on the San which remained confined to the older evolutionary analysis centred on material success in the modernist vision, rather than a "symbiotic" ontological world view:

Yet, the ontological turn, for all of its paradigm-shifting effects on the study of hunter-gatherers during the last and first decades of the previous and present centuries, all but by-passed the Kalahari, amongst whose hunting-gathering people ethnographers were wont to examine the human-animal relationship not in social, cosmological, mystical fashion but instrumentally and strategically, as a meat-on-the-hoof resource, cherished—more so than plant—for its high caloric yield and thus a key concern of the "foraging mode of production" and its modus operandi, "optimal foraging strategy". The effect of all of this was to render this foraging group as the optimal forager, whose "immediate-return" subsistence economy was seen to afford people "affluent" lifeways.

He thus sets out to correct this hole in the anthropological account by invoking the relationship ontology:

I set out in this book to show that San worldview and lifeways are in fact also, at the ontological level, the way people conceive of, perceive and experience their interaction with animals, along with other beings of their (pre)natural world, pervaded with relationality and intersubjectivity (and have done so in the past, on the basis of ethnohistorical and archaeological evidence largely on southern San that will be marshalled). In filling this gap in our understanding of San ethnography and culture I will also fill the gap in ontological anthropology, which has excluded these southern hunting people from its neo-animistic purview. Apart from adding new insights to the relational ontology perspective in anthropology, this study, of "Sanimism", also underscores the important insight that animism is not some monolithic schema or cosmologico-religious complex but something diverse and multiplex, structurally varied, ecologically and historically contingent. Indeed, as I will also argue, one such included in many and varied animisms of people and cultures of this world are Westerners.

The latter is given the widest scope phenomenologically for humans engaging with their expressive culture, ritual and hunting, as animal-beings and as being-animal. These two ontological concepts and experiences—and the process that links them, transformation—highlight the non-human beings that hold centre-stage in this study: animals. They are central also to this book's theoretical framework, animism (the "new" version), the core concept of which, "anima" ("soul"), is semantically linked to "animal".

Animals are front and centre also in San myth and cosmology. Animal stories are generated through the hunt, which provides an inexhaustible supply of narrative to San story tellers, who, in retelling the hunt and the animals encountered, through exciting or dangerous hunting endeavours or because of uncanny, “counter-intuitive” behaviour on the animal’s part rendering it beguiling and “attention-demanding” and transporting it into the realm of legend and myth.

This suggests as well that the “hunting magic” model for interpreting San rock art which the shamanism-based “trance hypothesis” rejects needs to be “reconfigured”, in terms of an “animism”-based model focused on the hunter-animal prey relationship rather than one based on shamanism and focused on the healer-human patient relationship. Mikko Ijäs (2017) in his study of San rock art, suggests that shamanic trance healing ritual developed from the experience of altered states of consciousness brought on by persistence hunting – “the hallucinatory hunting experience of transformation into an animal” – which he deems the primal hunting technique of Palaeolithic and Holocene hunters.

Alan Barnard notes the long-standing unity of both the eland dance and the religion and spirituality of the otherwise diverse San groups:

Male initiation involved fasting, dancing and hunting magic, including tattooing. Initiates also had to avoid unmarried women. Female initiation, as among the Naro, involved an Eland Bull Dance. All these rituals, where they occur, are remarkably similar across the Kalahari. It would seem that whereas there may be great diversity in matters of use of the micro-environments that characterize Bushman lands, in matters of religious belief and practice there is a unity. This is borne out especially in a recent article by Mathias Guenther. He concentrates on hunting, but his main point is that in the context of a New Animism, elements of ritual, myth, rock art and mysticism blend. This is true of the /Xam, but it is also true for the Ju/’hoansi. Lewis-Williams is also writing in this vein, in a way updating the Old Animism of the Bleek and Lloyd material to take in newer perspectivist ideas: instead of thinking like an outsider, learn to think more like a Bushman.

In his conclusion, Barnard focuses on the issues of religion and spirituality, both acknowledging the ancient foundational role of animism and the key role it may need to play in rescuing modern technological and religious society from the impending destruction of nature raising dire risk of our own demise:

The idea of the earliest theories of religion (by which I mean religion in the Middle Stone Age) has cropped up here and there throughout this book, but only in passing. We have left behind what is actually more interesting. This is the problem of human spirituality in general, a problem that surfaced in the very beginning of the book when I quoted a philosophical piece by Peter Nilssen and Craig Foster. They suggest that the earliest human societies had their roots in art, music, myth and symbolism and more specifically in animistic religion. If there were a global religion prior to 10,000 years ago, it was Animism. Or, as they put it: ‘At our core, we are all Animists, carrying remnants of a profoundly imprinted mindset and way of life based on a reverent and functional relationship with nature’ (Nilssen and Foster 2017). The implication is that humanity should try to reconnect with this ancient and nature-friendly spiritual tradition.

The Key to Our Future Buried in the Past: Philosophical thoughts on saving us from ourselves

Nilsen and Foster (2017) emphatically underscore the need for humanity to learn from our founding cultures ways to correct the planetary crisis human civilisation has set in motion to draw from our emergence in effective symbiosis with nature to enable our future survival. I will largely quote for their article in their own words because it is a brief account that is stunningly succinct and the literal key to our survival as a species:

An abundance of scientific data shows that in the last few millennia humans have placed life under severe stress and are expediting the sixth extinction event. It seems obvious then that the thrust of current research should focus on securing our future. Archaeology can be a key player in that regard. If human behaviour has brought us to this point, and if science is suggesting that we are at the end game, then we have answers to the why and when. What remains unanswered is the how. How do we alter human behaviour to achieve function and sustainability? The archaeological record is important because it is a road map of our development, with signs of where we have been, what we have done, what has worked and what has not. If our early ancestors survived and thrived in Africa prior to the introduction of food production and socio-political systems, then it is reasonable to suggest that their recipe for life worked. Currently our species is barely surviving and certainly not thriving; our recipe for life has failed. Maybe a glance at the past can provide some sorely needed wisdom and guidance. We are not suggesting a return to the Stone Age but rather a return to the original human ethos as a way to secure our future.

In real time, humans first appeared about 200 000 years ago and the origins of food production occurred some 10 000 years ago. This means that humans lived in and connected with nature for at least 95 per cent of our time on earth. It is only for the last five per cent or so that we have been manipulating nature for our own short-term benefit, to the long-term detriment of life in general. It is hardly surprising then that most of us find comfort, peace and joy in nature as opposed to the discontent associated with the sights, sounds and smells of industry and modern life. Our deep-seated relationship with nature, and 95 per cent of our genetic coding and heritage, is part of the original human design – gatherer-hunters are at the core of who and what we are.

We know of animals that use tools. Chimpanzees use 'fishing' sticks to extract termites from a termite mound. Birds drop shellfish or tortoises onto rocks to open them up for eating. We have the ability to make novel associations between separate items or ideas to create what we call composite tools. The bulk of our technology today consists of composite tools. The second characteristic that separates us from other animals involves symbolic behaviour. We know that animals use symbols, but they only do so to protect themselves, their territory and their reproduction. Humans also use symbols for such reasons, but we take symbolic behaviour to a different level. We use it to express our position with respect to our understanding and perception of ourselves and the world we occupy. The start of symbolic behaviour was the first step towards creating the tools that led to our industrial life today. However, early humans used symbolism sparsely, whereas today we use it to such a degree that we have completely lost touch with what is real. ... Since the start of food production and the development of complex society our mindset is that of ego: self-seeking and intent on the manipulation and domination of nature. We are driven to the infinite consumption of finite resources. This situation is radically different from that which pertained in the prehistoric period. We can thus surmise that a major component of the human dilemma and a major cause of our failure to care for the environment results from our disconnection from it.

Prior to the origins of food production and before the advent of complex societies, the vast bulk of human societies based their belief systems in Animism. In this system, which is still practised today, a life force is attributed to everything that exists, including the elements, plants, insects, animals and earth itself. Everything is revered and considered critical to the chain of being. As a practitioner's awareness expands, it is common to experience a profound lack of separation, where the entire known world is perceived as one sentient living form. This experience has been repeated across the ages. Most of the world's great spiritual leaders report very similar experiences of oneness. This experience in many ways is much more real than normal wakefulness as the psyche's ability grows exponentially during heightened awareness. The so-called real world of everyday human existence often feels like an illusion in comparison with this expanded state. It follows that the behaviour of these early ancestors was guided by a reverence for and consciousness of all life, and that their very lives depended on a functional relationship with nature.

Central to Animism is the hunter-gatherer 'trance dance'. It is not the prehistoric equivalent of today's trance parties in which people take recreational drugs and dance to loud music. Rather, through repetitive rhythmic dancing to clapping-singing-chanting-percussion around a fire, the trance dancers aim to reach an altered state of awareness, which they describe beautifully as 'the little death', the death of the ego. It is during these altered states that people have visions of entoptic phenomena and therianthropes – beings or entities that are part human and part animal. ... A second unnatural element in rock art, but one that also occurs around

the globe, is entoptic phenomena. These include cross-hatchings, zigzags, nested curves, spirals and other geometric shapes. Entoptic phenomena are images not observed by the eye, but are generated internally by the brain, usually during altered states.

Fig 193: Entoptic phenomena at the Northern Cape Nilsen and Foster (2017).

During trance states people achieve the overview or connectedness effect that reinforces the belief system founded in Animism. Several South African Middle Stone Age sites dating to 100 000 or more years ago contribute to our understanding of our very deep human origins.

The variety of entoptic phenomena on ochre, ostrich egg shell and bone suggests that these people were involved in altered-state practices and were very likely associated with Animism. Looking at our origins reveals that our early ancestors had at least two

ingredients in their recipe for success, namely a combination of cognition (intelligence) and symbolic behaviour (beliefs or spirituality).

So, what is the contemporary standing of our species? The status of society and its constructs are a perfect reflection of great intelligence in the absence of wisdom. The overall emphasis on the development of intelligence and efficiency, and the near absence of authentic spiritual development has resulted in a notable and often crippling imbalance in the human psyche. The ingredient we have lost is the spiritual aspect of what makes us human. It is this spiritual bankruptcy, evidenced by fame, famine, fear, wars, abuse of everything and lack of reverence that has brought our species to its knees, that has robbed us of our humanness. After food production, the evolutionary tree of belief systems becomes top heavy and complex, with the emergence of thousands of different religions and denominations. Christianity alone boasts several thousand denominations. Mostly these religions view humans as the pinnacle of 'evolution' who have the self-appointed right to dominate and control.

If Animism was the global belief system prior to food production and if we can push the beginnings of symbolic behaviour back to the emergence of humans, then at least 95 per cent of our genetic coding and heritage concerning belief systems relates to Animism. At our core we are all Animists, carrying remnants of a profoundly imprinted mindset and way of life based on a reverent and functional relationship with nature.

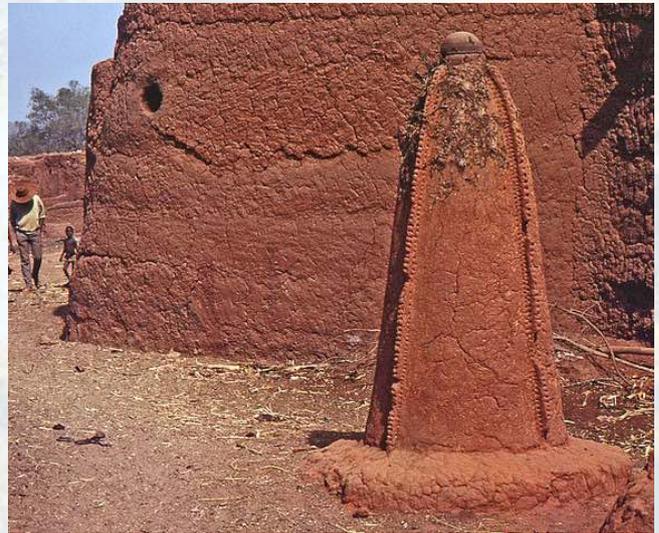

We are imprinted with the notion that we are separate from everything, including nature and each other, and that we are successful human beings if we can accumulate external wealth and power. We are thus imprinted to be part of an ego-based consumer society with only a secondary regard for nature, the environment and fellow human beings. Our resultant behaviour is causing the death of our oceans and the onset of the sixth mass extinction. Humans are the single most dangerous mammal on the planet, responsible

for more human deaths than any other, yet, ironically, very fragile compared with many other smaller species. Some scientists predict human extinction within a few hundred years unless radical change occurs in human behaviour.

All this relates to a tiny fraction – five per cent or less, or less than one per cent if we include the hominin lineage – of our time on earth. For the balance of our past we were imprinted with the notion of the interconnectivity of all things and reverence for life; it was these nature-based knowledge and belief systems that allowed our species to thrive. The inter-connectivity of all, the law of one, as taught by spiritual leaders since the dawn of time, is now supported by quantum physics, which states that at the foundation of it all there is only one thing, a singularity, a unified field of energy, one intelligence, one consciousness. Everything is connected.

The point is simply this: we stand at the tipping point: either we change our habits and tendencies, or our future is in serious doubt.

Fig 194: Animist altar, Bozo village, Mopti, Bandiagara, Mali, 1972 The Bozo are sometimes referred to as the "masters of the river". Though they are predominantly Muslim, they preserve a number of animist traditions as well. Their animal totem is the bull, whose body represents the River Niger and whose horns represent the Bozo fishing pirogues.

There is a critical message here for all of us. Not only are the San Bushmen one of or the oldest known human cultures, possibly shared with the tropical pygmy peoples of the Congo, representing the mitochondrial African Eve, but they have the archetype of how humanity can survive ecologically over hundreds of thousands of years including some of the toughest most inclement environments. Given the combination of this with the ability to live with nature symbiotically, not intervening in it any any way, but to collect its surplus bounty, while espousing a world view of integrated relationship with it over millennia, they hold our deepest and most insightful key to our own survival.

Entasis and Ecstasis: Complementarity between Shamanic and Meditative Approaches to Illumination

Stuart Sarbacker (2002) notes contrasting themes between the practices of shamanism as practised world-wide and particularly in the Americas and those of Eastern meditation and devotion – Mircea Eliade's (1958) notion that the ultimate goal of shamanism is *ecstasis*, a type of visionary experience that involves the association of mythical beings and their realities, in contrast to *entasis*, the more abstract goal of release from conditioned reality that is characteristic of Indian forms of yoga, most notably Classical Yoga and Buddhism.

In two of his most famous works, Yoga: Immortality and Freedom (1958) and Shamanism: Archaic Techniques of Ecstasy (1972), the Historian of Religions Mircea Eliade attempts to elucidate the distinctiveness of shamanic and yogic typologies of religious belief and practice. Through this process, Eliade notes at several points what he believes is a fundamental distinction between shamanic and yogic practice and experience that can be understood as the difference between entasis and ecstasis, or enstasy and ecstasy, respectively "standing within" and "standing without." ... The controversial issue of determining the primary characteristics of shamanism is framed by the context of Eliade's emphasis on ecstasy as the definitive component of shamanism as opposed to possession and other phenomena. In the case of the study of meditation (dhyana) in the Hindu and Buddhist contexts, the terms enstasy, enstasy or enstatic have become an important part of the terminology of both Hindu Buddhist studies.

A number of other issues not found in Eliade's work ... further illuminate this relationship and demonstrate other important possibilities for the yoga – shamanism comparison. These include examples of initiatory types of phenomena associated with Buddhist meditation, the junction of enstatic and ecstatic modal in the development of meditation in Buddhist and Hindu yoga, and the possibility of viewing the yogic practitioner as a sort of psychopomp akin to the shaman. It will be demonstrated that the enstatic and ecstatic modalities can be better seen as being dynamically related rather than mutually exclusive, and that Eliade's distinction is useful but in need of further elaboration and specificity. Enstatic and ecstatic phenomena have an intimate relationship with what can be called numinous and cessative modalities or conceptions of religious practice and experience, demonstrating both continuity and distinction in the yoga-shamanism relationship. These dimensions have a deep connection in how they tie together psychological and social realities in the lives of religious practitioners, and relates both to questions of cosmology and divinity.

Eliade states that shamanism can be said to possess four primary elements. These include: an initiation in which the adept faces death, dismemberment, and possibly a descent into the underworld and an ascent into heaven; an ecstatic journey in which the shaman acts as healer or psychopomp; a "mastery of fire" in which the shaman proves himself capable of withstanding some type of

ordeal; and an ability to change form, to "become invisible" and to demonstrate other magical powers (Eliade 1958:320). The primary factor among these, according to Eliade, is ecstasy, the ability to leave the body in order to journey to otherworldly realms, and to master the world of spirits, ultimately qualifying the shaman as a "specialist in the sacred." The essential and defining element of shamanism is ecstasy— the shaman is a specialist in the sacred, able to abandon his body and undertake cosmic journeys "in the spirit".

However Quirce Balma (2010) makes clear the mistaken doctrinal view of Eliade in discounting entheogenic shamanism as non-existent, irrelevant, or degenerate in relation to other forms of shamanism involving rhythm and trance states:

In the period in which Eliade dominated interpretation in the field of native anthropology, he flatly denied that entheogenic hallucinogens formed part of the culture of those peoples. For Eliade, native logic, free from both the alphabetic and rational logics of our society, liberated the unconscious to produce dreams and visions of a much more symbolic and animistic type, than what could be a simple hallucinatory state induced by a drug. For said author, the above does not correspond to a true human being, but to a human being affected by a pharmacological delusion.

Fig 195: Ecstasy vs Entasis: Shamanic verdant immersive visionary chaos vs Samadhi's spiritual order renouncing conditioned reality. (Left) Pulsations. A group of vegetalistas has taken ayahuasca and through an icaro, Queen Pulsarium Coya they seek to diagnose patients by interpreting the pulse with hands connected to the brain. In the Amazon traditions, such a session may also seek to counteract sorcery by shamans of other tribes. In all cases, there is an intimate coupling between nature and the shamanic experience achieved through the entheogens (Luna & Amaringo 1991). (Right) A modern painting of Sukhavati, the pure land that's associated in Mahayana Buddhism with the buddha Amitabha, known in Japanese as Amida. As discussed below this is not nirvana but a land to seek a pure rebirth in that is closer to nirvana. The images evoke the contrast between immersion within nature and a pristine world of order and purity.

Eliade was almost entirely in command of anthropology for decades. It was only when authors such as Campbell (1962) and Jung (1969) began to investigate the mythology and the possible use of pharmacological agents, such as in the ancient nations of Asia Minor, hashish and opium, among others, that it cracked slightly, but decisively, the fundamentalist and somewhat severe thesis of Eliade. The arrival of Wasson (1958) produced a profound disturbance in Eliade's thesis in the 1950s. Fully supported by botanical anthropologists such as Schultes (1963, 1977) and later by other authors such as Harner (1977) and McKenna (1988), Wasson began a series of investigations aimed at proving that the very basis of native and shamanic religions were plant-derived entheogenic psychopharmaceuticals. ... Many authors followed Wasson's path to go so far as to suggest that all current religions began at some point or another with a botanical methodology of entheogenic ingestion.

Of course, the exaggerations need to be given and proposed to establish the controversies, since we know that in Buddhism and Hinduism in China and India, marijuana was used (for the ceremonies of Lord Shiva in the temples) to ephedrine (in Ma Huan tea) and regular black tea (theophylline, which is a methylxanthine). The first to enter a trance state, the second and third to stay awake during the long hours of prayer, contemplation, chanting and meditation.

Sarbacker (2002) investigates the meditative quest of the Eastern traditions, attempting to draw a complementation out of the contrast between the immersive, ecstatic approaches of shamanism and renunciative, enstatic approaches of Eastern mysticism seeking to treat these as present in both approaches with different emphases:

The yogin, or yoga practitioner, as a specialist in the sacred is akin to the shaman as a religious ideal, an example of how religious ideas are concretely embodied. According to this interpretation, the yogin, like the shaman, is understood to embody the truths of his or her tradition (Hinduism, Buddhism, Jainism etc.) and therefore exemplifies the living reality of its philosophy, mythology, and so on. Both the shaman and the yogin are understood in their respective traditions to have unique powers of perception and vision,

and therefore they are understood to play a role as specialist in their religious community, perhaps even as mediators between the mundane (profane) and supramundane (sacred) worlds.

The notion of ascension is carried through several levels of investigation in Eliade's (1958 326-330) work. The climbing of the ceremonial ladder in the performance of Vedic ritual is said to represent the shamanic ascent of the heavens through the conquering of the "world tree," and serves as a starting point for Eliade's analysis of ascension motifs.

We meet the same symbolism again in Brahmanic ritual; it too involves a ceremonial ascent to the world of the gods. For the sacrifice, we are told, "there is only one foundation, only one finale...even heaven." "The ship fair crossing is the sacrifice"; "every sacrifice is a ship bound heavenwards." The mechanism of the ritual is a *durohana*, a "difficult ascent," since it implies ascending the World Tree itself (Eliade 1972: 403).

In the development of *samadhi*, "contemplation" or "absorption," (Eliade's *enstasis*) and more generally, *dhyatui*, "meditation," in the Buddhist context, there is an understanding that meditators who have attained a significant degree of progress in meditation approximate the consciousness of gods in higher cosmological realms. These realms in Buddhism are those of the "form realm" and the "formless realm," which constitute two of the so-called "three realms" of Buddhism. The third realm is the "desire realm" in which there are successive levels of rebirth including those of deities, human beings, animals and hell-beings, among others. The former contain only deities, and they are considered to have cognitive powers superior in many respects to the deities of the desire realm. As a result of attaining high degrees of refinement of meditation in one's life, a practitioner of *samatia* or "tranquility" meditation may be reborn after death in the realm equivalent to that meditative state [*sukhavati*]. There is certainly sense in which the realms build upon each other, in that the higher realms imply that the beings have a very refined state of consciousness. The higher rebirths within the desire realm and by extension in the higher abodes of the form and formless realms are also indicative of a high degree of religious merit. All of these states are considered to be part of *samsara*, and do not therefore constitute liberation any permanent heavenly abode. The "attainment of cessation," does not refer to a state of rebirth at all, but rather to the cessation of all mental and physical functions, in some cases identified with liberation, but not in locative or cosmological and psychological states represents the *soteriological* (salvation, enlightenment) path of Buddhism.

The Patanjala Yoga tradition also embraces a series of levels of *samadhi* that lead to profound states of being, acting and knowing. The Classical Yoga tradition presents a typology of yogins based upon the attainment of different stages of *samadhi* — such as the *praktilaya*, "immersed in the phenomenal ground material reality," and the *videha*, "bodiless one" who has developed a significant degree of skill in *samadhi* but not complete liberation. In both cases, there is set of stages that encompass a notion of attainment through an ascension motif which is placed parallel to a notion of cessation, *nirodha*, which is seen to be the distinct culmination of the *soteriological* [salvational] process.

This fact may well suggest two trends rather than just one, possibly even the coexistence of ecstatic and enstatic techniques, establishing a dynamic between the ascension and cessation.

This complementarity however has profound implications. While the enstatic path leads to cessation in a spiritual journey attempting to disengage from the confinements of a conditioned life in the round of birth and death, the ecstatic path leads to immersion in nature and a path of engagement with and protection of the diversity of life.

Just as the Mahayana or greater path seeks not just the personal enlightenment of Hinayana, but the enlightenment of all beings, so the shamanic animistic path augments the confines of pure spirituality which seeks only divine imaginary worlds, neglecting the urgency and essentiality of protecting the diversity of life immortal, in a greater Mahayantra, so that the very experience of illumination can ensue and evolve throughout our generations forever.

3 Eastern Spiritual Cosmologies and Psychotropic Use

This perspective fits closely with a long-standing cosmological position in Eastern philosophy, where mental states are envisaged as being 'finer' than gross physical states, also having an indivisible wholeness to their character, or that the cosmological foundation is itself undivided consciousness. The Upanishads date from 900 to 600 BC. The *Bṛhadaranyaka* and the *Chandogya* are the two earliest Upanishads. They are edited texts, some of whose sources are much older than others. The two texts are pre-Buddhist; they may be placed in the 7th to 6th centuries BCE, give or take a century or so. The fundamental concern of the Upanishads is the nature of reality (Purohit & Yeats 1937). They teach the identity of the individual soul (*atman*) with the universal essence soul (*Brahman*). In contrast with Buddhism, which believes that there is neither a soul nor self, Hindu philosophy (Hiriyanna 1932) has argued that qualities such as cognition and desire are inherent qualities which are not possessed by anything solely material, and therefore, by the process of elimination must belong to a non-material self, the *atman*, thus seeing one's spiritual goal as **moksha** — liberation from the cycle of birth and death. Śāṅkara held that the mind, body and world are all held to be appearances of the same unchanging eternal conscious entity called *Brahman*, the "creative principle which lies realised in the

whole world”, the “unchanging, permanent, highest reality” which is described as Satchitananda (Being, consciousness and bliss) ⁵⁵.

Fig 196: (a) Vishnu dreams the universe through the navel lotus of Brahma, overlooked by Lakshmi, (b) Ritual cannabis use in ancient Israel (Arie, Rosen & Namdar 2020), (c) Shiva sadhu smoking Ganga, (d) Tantric creation involves sexual complementarity of Shakti representing the body of the universe and Shiva representing mind, in which the unity of cosmic consciousness retreats into multiple conscious experiences of the physical world in the dance of Maya. This complementarity is shared by Taoist Yin/Yang.

To Shakti a Devotion

In the Tantric creation (Rawson 1973), Shiva and Shakti begin as a whole in intimate cosmic embrace, of subject and object, then retreating from this intimacy to become multiple conscious entities perceiving the physical world around them as dualities emerging from the complementary totality coming to recognise itself in individual consciousness only through moksha, due to their psychic and physical fragmentation in Maya. This is celebrated in maithuna the sacred sexual union, also in Buddhist Yab-Yum illustrated in Twelve-Armed Chakrasamvara and His Consort Vajravaraahi and in the Kaula rite of Yamala (The couple):

“It is consciousness itself, the unifying emission and the stable abode – the absolute, the noble cosmic bliss consisting of both Shiva and Shakti. It is the flowing font of both quiescence and emergence.”

The Receptive and Creative principles of Yin and Yang also reflect this in the Tao (Rawson and Legeza 1973):

*There was something complete and mysterious existing before heaven and earth,
Silent, invisible, unchanging, standing alone, unceasing, ever in motion.
Able to be the mother of the world. I do not know its name. Call it Tao. (Lao Tsu).*

⁵⁵ Advaita Vedanta (Sanskrit: अद्वैत वेदान्त –“non-duality”), propounded by Gaudapada (7th century) and Adi Shankara (8th century), espouses non-dualism and monism. Brahman is held to be the sole unchanging metaphysical reality and identical to the individual Atman. The physical world, on the other hand, is always-changing empirical Maya. The absolute and infinite Atman-Brahman is realized by a process of negating everything relative, finite, empirical and changing. All souls and their existence across space and time are considered to be the same oneness. Spiritual liberation in Advaita is the full comprehension and realization of oneness, that one's unchanging Atman (soul) is the same as the Atman in everyone else, as well as being identical to Brahman.

Fig 197: Shri-Yantra has superimposed yoni-lingam motifs, Yoni (South India).

Because Symbiotic Existential Cosmology has turned out to be a direct realisation of both the Tantric creation and the Upanishadic creation of Brahman and atman, in retrospect I have added a synopsis of the principles of the founding cosmology of the Brihadaranyaka Upanishad as a counterpoint. Where the difference lies is that symbiotic cosmology is fully grounded in nature and the diversity of life as a cosmological phenomenon and is not based on mind alone. The cosmic mind is a manifestation of incarnate biodiversity. To make this point clear after our [vigil to Jerusalem](#) I made a [vigil to Varanasi](#) to pay my respects to Kali as the complementary “ultimate reality” to Shiva’s cosmic mind, fully embodied in nature, fertility and the flow of time.

Tantra

*The universe is real embodiment!
Consciousness is real experience!
Each are cosmological complements!
The one cannot exist without the other.*

*Neither reigns supreme, but together are complete.
A prisoners’ dilemma invincibly united in reality.
Just like the yin and yang of our two sexes,
caught in asymmetric reproductive coexistence.*

Brahman (Sanskrit: ब्रह्म) connotes the highest Universal Principle, the Ultimate Reality in the universe. In major schools of Hindu philosophy, it is the material, efficient, formal and final cause of all that exists. It is the pervasive, infinite, eternal truth and bliss which does not change, yet is the cause of all changes. Brahman as a metaphysical concept refers to the single binding unity behind diversity in all that exists in the universe. In non-dual schools such as the Advaita Vedanta, Brahman is identical to the Atman, is everywhere and inside each living being, and there is connected spiritual oneness in all existence. Ātman (Sanskrit: आत्मन्) refers to the (universal) Self or self-existent essence of human beings, as distinct from ego (Ahamkara), mind (Citta) and embodied existence (Prakṛti).

The **Brihadaranyaka Upanishad** opens with a cosmological manifestation, echoed in every person’s realisation:

“I am He” – Aham Brahma Asmi (अहम् ब्रह्मास्मि)
"I am Brahman".

Fig 198: Brihadaranyaka ⁵⁶ Upanishad literally means the "Upanishad of the great forests of the wilderness".

The **Brihadaranyaka** is the **biodiverse Upanishad of the living Universe**. It is estimated to have been composed about 700 BCE, with some parts coming later. Brihadaranyaka literally means "great

⁵⁶ **Brihat** Brhat (बृहत्).—a. (-त्तिं f.) [बृह्-अति (brh-ati)] (1) Large, great, big, bulky; (2) Wide, broad, extensive, far-extended (3) Vast, ample, abundant (4) Strong, powerful (5) Long, tall (6) Fullgrown (7) Compact, dense (8) Eldest, or oldest (9) Bright. **Aranyaka** (āranyaka) "produced, born, relating to a forest" or rather, "belonging to the wilderness". It is derived from the word Aranya (अरण्य), which means “wilderness”.

wilderness, or forest". It is credited to the ancient sage Yajnavalkya, considered as one of the earliest philosophers in recorded history and credited with the term Advaita (non-duality of Atman and Brahman). By comparison, Gautama Buddha's birth dates from 563 or 480 BCE. The Brihadaranyaka Upanishad portrays Yajnavalkya as having two wives, Maitreyi who challenges Yajnavalkya with philosophical questions as a scholarly partner and Katyayani who is silent. While Yajnavalkya and Katyayani lived in contented domesticity, Maitreyi studied metaphysics and engaged in theological dialogues with her husband, in addition to making her own self-inquiries of introspection.

The first chapter asserts that there was nothing before the universe started, when Prajapati created from this nothing the universe, imbued it with Prana (life force) to preserve it in the form of cosmic inert matter and individual psychic energy. Prajapati (Sanskrit: प्रजापति), is the 'lord of creation and protector', later identified with the creator god Brahma, but also many different gods. In classical and medieval era literature, Prajapati is equated to the metaphysical concept called Brahman as Prajapati-Brahman, or alternatively Brahman is described as one who existed before Prajapati.

Cosmological Complementarity

Brihadaranyaka asserts that the world is more than matter and energy – it is constituted also of Atman or Brahman (Self, Consciousness, Invisible Principles and Reality) as well as Knowledge.

Mental States approaching the Mind at Large The second chapter propounds the theory of dreams, positing that human beings see dreams because the mind draws, in itself, the powers of sensory organs, which it releases in the waking state. It then asserts that this empirical fact about dreams suggests that human mind has the power to perceive the world as it is, as well as fabricate the world as it wants to perceive it. But mind as a means, is prone to flaws. The struggle humanity faces, is in our attempts to realise the "true reality behind perceived reality". That is Atman-Brahman, inherently and blissfully existent, yet inaccessible because it has no qualities, no characteristics, it is "neti, neti" (literally, "not this, not this").

Love is Cosmic Reunion The fourth brahmana of the second chapter notes all love is for the sake of the Self, and the Oneness one realises in the Self of the beloved. Knowledge of the Self, the Brahman is what makes one immortal, the connection immortal. All longing is the longing for the Self, because Self is the true, the immortal, the real and the infinite bliss.

Cosmological Symbiosis

The fifth then states that everything is connected, beings affect each other, organic beings affect inorganic nature, inorganic nature affects organic beings, one is the fruit of the other, everyone and everything is mutually inter-dependent, nourishing and nurturing each other, all because it came from one Brahman.

Immanent and Transcendent Self The fourth brahmana of the third chapter asserts, "it is your Self which is inside all", all Selves are one, **immanent and transcendent**.

Panpsychic Cosmology The seventh discusses how and why the **Self interconnects and has the oneness through all organic beings, all inorganic nature, all of the universe**.

Learn three cardinal virtues – temperance, charity and compassion for all life.
तदेतन्नयं शिक्षेद् दमं दानं दयामिति — Brihadaranyaka Upanishad, V.ii.3

Neti Neti (Sanskrit : नेति नेति) is a Sanskrit expression which means "not this, not that, or "neither this, nor that" (neti is sandhi from na iti "not so"). With its aid the subject negates identification with all things of this world, which is Anatman (Not-Self). The Brihadaranyaka Upanishad II iii 1-6, states there are two forms of Brahman, the material and the immaterial, the solid and the fluid, the Sat 'being' and tya, 'that' of Satya – which means true, denies the existence of everything other than Brahman. The Self is thus real – the universe is not empty and it is not just matter, but filled with eternal conscious psyche.

Some of this philosophical and religious perspective has been driven psycho-pharmaceutically, with the use of cannabis as a visionary agent central in the life of Shiva sadhus as *Ganga*, the sacred river of Indian spirituality, along with historical evidence for the Soma of the Aryans and ancient ritual uses of cannabis in Israel 700-900 BC (Benet 1975, Arie, Rosen & Namdar 2020), China (500 BC) and among the Scythians (Rudgley 1993), and of ancient opium use in the Near East and Mediterranean.

Indra (इन्द्र) is the king of the devas and Svarga (heaven) in Hinduism. He is associated with the sky, lightning, weather, thunder, storms, rains, river flows, and war. Indra's powers are similar to other Indo-European deities such as Norse Odin, Jupiter, Perun, Perkūnas, Zalmoxis, Taranis, Zeus, and Thor, part of the greater Proto-Indo-European mythology. Indra drank copious soma.

In the Vedic tradition, sóma (Devanagari: सोम) is a ritual drink of importance among the early Vedic Indo-Aryans. The Rigveda mentions it, particularly in the Soma Mandala. Gita mentions the drink in chapter 9, the Soma Mandala. It is equivalent to the Iranian haoma. The texts describe the preparation of soma by means of extracting the juice from a plant, the identity of which is now unknown and debated among scholars. Both in the ancient religions of Historical Vedic religion and Zoroastrianism, the name of the drink and the plant are not exactly the same.

*We have drunk the soma; we have become immortal; we have gone to the light; we have found the gods.
What can hostility do to us now, and what the malice of a mortal, o immortal one?*

The Zoroastrian Frashokereti likewise notes the sacred drink parahaoma:

The righteous will partake of parahaoma, which will confer immortality. Thereafter, humankind will live without food, without hunger or thirst, and without weapons (or possibility of bodily injury).

In this context, one also has to consider the Buddhist tradition. I have during my journeys taken Tibetan Buddhist initiations with both the 16th Karmapa, and with the Ningmapa exorcist Yeshe Dorje, who lived in a kerosine tin shack with a Tibetan wife and several children above McLeod Gang in 1976 and both predicted the rainfall for builders, exorcised mental disabilities and scurried the clouds accompanying the Dalai Lama in Dharmasala. Later he moved to the US, where I took this video of him doing a puja in Santa Fe. Here is also a video I took of the milk baba of Pashupatinah in Kathmandu. All of these have since passed away. I do not follow any tradition. I reserve my path to be natural first person visionary experience, so that it is not beholden to any existing tradition.

I tend to see Buddhism as an outgrowth of the more ancient traditions embracing the principles of the Upanishads, just as Christianity arose out of Judaism, and appreciate the verdant polytheism spanning all the persona from Krishna to Shiva and Kali, harking back to 2500 BC in Mohenjo Daro. I have deep engagement with Brahman as a manifestation of “ultimate reality”. I have concerns that Buddhism, notwithstanding the immediacy of satori, is too focussed on mind over physical nature and the feminine as Maya – natural fecund chaos and is thus too focussed on the negative – renunciation and the suppression of the ego, which is good meditative practice, but tends to leave a negative void world view of enlightenment rather than the positive value of existence in the living universe. However Tibetan Buddhism also has roots in Bön shamanism, highlighting its ancient syncretic nature, and is pervaded by Tantra, giving it numinous diversity.

Common to the Eastern traditions, the emphasis on mind over nature means that both Buddhism and Hindu traditions, share the notion of, as sentient conscious beings, which really began as a conceptual “consolation prize” for moksha being so difficult to achieve in this lifetime, without sacramental entheogens. Because all life is viewed only from the perspective of conscious sentience, this subjugates the natural diversity of living species to a mind only perspective, where rampant vermin killing rare species as preserved. This becomes an affront to the evolution of living diversity as intrinsic natural embodiment. I live in Aotearoa, where native species, such as the iconic kiwi, are excessively vulnerable to feral exotic predators. Buddhists, who do revere the sanctity of life, often find themselves unable to control predators and end up failing to protect living diversity, because they can’t conceptualise the difference between a threatened species like the kiwi and an epidemic of rodents, stoats, and possums driving them to extinction. This is where the Bhagavad Gita of living nature has to say the diversity of life, that has taken billions of years to evolve, has to be respected and that the mind-only view of conscious existence is a false cosmology.

Fg 198b: Centre: the goddess of the sacred grove, an early Kālī manifestation, (L-R) Shiva as Pashupatinath the lord of the animals, human sacrifice. Indus Valley 2500 BC (Campbell 1962 166-9). Shakti-Kālī expresses the temporal embodiment of cosmic ultimate reality in nature that tends to be neglected by mind-sky Eastern mysticism.

Karen Armstrong (2022) in “Sacred Nature” notes the emergence of Upanishadic Vedanta from the earlier more animistic pervasiveness of nature resulting in a transition from mythology to cosmology:

The rishis attributed their poetic power to the hallucinogenic plant soma, which enabled them to look beneath the surface of things and discover a deva in every single one, so nature was alive, imbued with the divine. They called the faculty they had cultivated dhi (“insight”); it gave them a knowledge (veda) that bore no relation to mundane awareness. All these divine forces, the rishis concluded, were grounded in a mysterious omnipresent power, which they called Rta, one of the most important concepts in the Vedas, the ancient texts of Hinduism. Rta is best understood as “active, creative truth” or “the way things truly are.” Like qi and the Dao, Rta was not a god but a sacred, impersonal, animating force. It was impossible to describe or define Rta, but it could be experienced as the sublime whole, which flowed from itself expansively, bringing about the cosmos, humans and the gods themselves. The fact that for most of history people in different parts of the world developed such a remarkably similar conception of this sacred reality suggests that it may be an archetypal notion embedded in the human psyche. But after creating and organising the world, the devas did not return to heaven. They took up residence in the natural phenomena they had brought into being and dwelt forever within them. Thus every single bird, animal or flower embodied the divinity that had created it, and everything in the world had a sacred core. Instead of merely shining on things from afar, the devas remained embedded in the mundane, “entering into this world through their hidden nature.”

By about the sixth century BCE, however, the Aryans were redefining the ultimate reality; and they called it the Brahman. While Rta had been the eternal principle of being that informed and permeated the universe, the Brahman was the foundation of all reality, the “beingness” on which all things depended. This development was part of a new spirituality called Vedanta (“the end of the Vedas”), which sought to reveal the essential purpose of the ancient rites. Whereas the early rishis had depicted the gods poetically as different aspects of the one divine reality, the Vedantic priests now expressed this insight philosophically. The Brahman was the one and only sacred Atman (“Self”) of the entire universe. It pervaded everything and every person “right up to the tips of the fingernails.” It “lives in each and every being. Uniform, yet multiform, it appears like the [reflection of the single] moon in [the many ripples of] a pond.” The people of India would never lose this insight.

She however notes the emergence of ‘naturalness’ in Buddhism happened later:

So deeply was humanity’s religious impulse connected with the sacrality of nature that even a religious tradition such as Buddhism—which originally focused on the method of introspection by which humans could be liberated from sorrow—eventually turned to nature. When Mahayana Buddhism arrived in China, it insisted that the Buddhata—the “Buddha-Nature” or the potential to achieve Buddhahood and Enlightenment—was not confined to human beings but inherent in plants, rocks, trees and blades of grass. In the Dacheng qixin lun (“Awakening of Faith”), a sixth-century CE text, we learn that the Buddha-Nature is the essence of the entire cosmos, an “eternal, permanent, immutable, pure, and self-sufficient force that unites all beings, draws them into a coherent whole, and universally illumines the mind of man and enables him to cultivate his capacity for goodness (ren).” ... In Japan, Zen Buddhists believe that a single Buddha-Nature exists in the things of nature and that it is inseparable from the human self. The aim of Zen is to cultivate awareness of its existence, making it a reality within oneself.

Buddhist, Upanishadic and Biospheric Sacramental paths to Illumination

Buddhism in the US has developed a complex relationship with the use of psychedelics in a context of meditation. This is discussed in detail in “Altered States Buddhism and Psychedelic Spirituality in America” (Osto (2019), where psychedelics are described in succeeding chapters as a gateway, prelude, or adjunct to the true dharma involving both psychedelics and Buddhism in terms of practitioners’ varied points of view, and in and in “Zig Zag Zen: Buddhism and Psychedelics” (Badiner & Grey A 2015) discussed in [Primal Foundations of Subjectivity](#).

Hindu traditions, likewise have an ancient tradition of Shiva worship through ganja and bhang as form of cannabis intimately connected with meditative states and spiritual contemplations of the sadhus.

To Anand Rangarajan, a follower of Tibetan Buddhism and a UF CISE information scientist, Paul Werbos a Quaker mystic and machine learning pioneer, and Deepak Chopra a well-known author practicing the Eastern Wisdom

Tradition. I have found your conversations interesting and thought it could be helpful to add my perspective on the situation. I have a strong affection for Deepak's two positions (1) Everything is alive and (2) Consciousness is primary. However, like Paul, I accept (3) The universe is necessary. In fact I see the primary reality of consciousness and the necessary reality of the universe as complementary aspects of a cosmology which is neither monist nor dualist, but is the very Tantra of existence.

Fig 199: [Yeshe Dorje](#)

I have experience with Tibetan Buddhism at the hands of Yeshe Dorje and Rangjung Rigpe Dorje the 16th Karmapa, as well as Chogyam Trungpa's writing, travels in Tibet and Japan and experience of the Vedantic tradition from periods wandering India as a sadhu. For me the true Buddhism is what you see watching the devotions of the pilgrims passing through the Jokhang and the little shrines that surround it and in Hinduism, people you meet like the Milk Baba of Pashupatinath, the wayside shrines and ochre-stained yoni-lingams being spontaneously prayed to by schoolgirls on their way to class. I hold strongly to the underlying Upanishadic traditions.

I first met Yeshe Dorje, the exorcist lama, a Ningmapa closer to the original Bon shamanic traditions, who cleared the weather for the Dalai Lama and people putting roofs on houses in McLeod Gang and cured mental afflictions in his kerosine tin shack with his wife and seven children. When I took Buddhist vows, he warned me not to take the teachings of the monastic Gelugpas too seriously. He named me Yeshe Tenzin after himself and the Dalai Lama Jamphel Ngawang Lobsang Yeshe Tenzin Gyatso in 1976. Later we met again in Santa Fe in 1992, with an American partner, as I recall. You can find a critique discussion of both Buddhist and Vedic doctrines in the appendix.

However my prime numinous and visionary focus for the last 50 years has been sacramental meditation evoked by sacred mushrooms, peyote and ayahuasca, so I want to explain to you how this perspective complements and provides insights into your favoured traditions. Somewhere I have an old Tricycle issue dealing with this from a Buddhist perspective entitled "Just Say Maybe", so this is still a process in progress.

Fig 200: The Milk Baba of Pashupatinath Kathmandu Ram Krishna Das Vaishnaba, who consumed only milk for 40 years.

When I take mushrooms, I go into retreat and adopt a form of Upanishadic meditation which alternates between mindfulness and mindlessness – complete abandonment to the abyss, letting go of everything. This is almost an impossible task in the maelstrom of psychedelics but it is transfiguring and galvanising when it occurs. The Huichol have a name nierika for the cosmic portal peyote provides between ordinary reality and the spirit world, which is illustrated in yarn paintings as a richly illuminated cosmic orifice surrounded by all the illusory visions of tangential approach. There are several points that emerge.

The first, most devastating point is that this experience is not achieved in human conscious renunciation, or through lofty spiritual achievement and practice, but in the complete humility of natural psychic symbiosis with the biosphere. So, while I agree that mindfulness is the road to life, the sacramental approach is putting the sap and dew of nature right into the centre of the cyclone of moksha. Mindfulness can be mistaken for focused attention, but sacramental moksha is the revelation of interconnectedness of all conscious life and of all the diversity of life throughout the universe. This is humanity's founding vision of animism that all religious traditions later captured and misused. So the consequences are that the religious traditions confuse the diversity of life and its utter sacredness in the unfolding of consciousness, with notions like animals as simply sentient beings that are a product of previous moral indiscretions, creating a mind-sky view, in which human spiritual attainment is supreme over nature. Sacramental meditation, by contrast, is a true first-person Tantra with no confounding doctrine. It is expressing the complete complementarity of the Shivaic cosmic mind and the embodiment of Shakti in nature and the universe as an inextricable prisoners' dilemma, evoking reality as we know it to be. No longer is the mind alone but reunited with nature, embedded in the immortality of life, with a primary cosmological responsibility to the diversity of life as a whole.

The second point is that all the distinctions you have raised, for example between mindfulness and the void of no-mind, or between gradual enlightenment, rather than the instantaneous flush of satori become meaningless. They are just parts of the overall vision quest. Mindfulness is essential to gather one's focus and equanimity and yes it is pro-life rather than denial, but then one has to relinquish the internal dialogue and the ego-consciousness that accompanies us, to completely give one's self back to the universe, or more aptly the cosmic mind at large, to gain release from the mortal coil. Then we have the satori! This has a lot of implications. There is no distinction between the Brahman approach and the Zen or Bodhisattva approach. And there's a warning! The broad sweep of Eastern philosophy is integrally an expression of the meditative practices that support each, coming to pervade Buddhist and Vedantic cosmology. To the extent that these techniques are restricted, the cosmologies become restricted and lose integrity,

particularly when applied for coercive moral ends. In this the sacramental approach has a fertilising role to play. So any distinction that the Upanishads are too much about mind are simply a product of contesting disciplines. The reality is much simpler and more direct. I like the Upanishads because their description is a clear direct route to samadhi accepting the atman and Brahman as ultimate reality. Moreover sacramental samadhi adds a completely new dimension to the discourse, because it is bringing another kind of non-ordinary reality to the table, although one that has a lineage of equal antiquity to the Eastern or meditative traditions. This is thus a completion of the human mystical spiritual tradition and not a degenerate, incomplete, or imperfect path.

One can think of the entheogenic moksha epiphany occurring in a neutral state of ego dissipation and sensory withdrawal experiencing organismic moksha as the supermind at the interface of atman and Brahman – the mind at large. *At the centre of Aurobindo's metaphysical system is the supermind, an intermediary power between the unmanifested Brahman and the manifested world. Aurobindo claims that the supermind is not completely alien to us and can be realized within ourselves as it is always present within mind since the latter is in reality identical with the former and contains it as a potentiality within itself* (Wikipedia Aurobindo 1990).

This was the central concept of Aurobindo's metaphysical system, which he claimed can be realised within ourselves, as it is always present, since the mind is in reality identical with the supermind and contains it as a potentiality within itself. In *The Integral Yoga* he declared that "By the supermind is meant the full Truth-Consciousness of the Divine Nature in which there can be no place for the principle of division and ignorance; it is always a full light and knowledge superior to all mental substance or mental movement."

The third and final point somewhat distinct from "pure" spiritual experiences is that entheogenic moksha is scintillating with abundance. There is no need to ask questions like "is this or that a construct", or to try to deconstruct maya through realising all aspects of consciousness including the self are constructs and hence illusory. And it is not just a formless black void of nothing that is somehow construed to be the source of everything, but the light of illumination streaming out of the epiphany of being. Yes it is all in a sense an illusion but it is non-ordinary reality teaching us and it's test is not philosophical but the infinite compassion of the eternal mind at large for the mortal biological being experiencing moksha, so it has an immediate truth to it that is transformative of the mortal condition and the associated sensoria are veridical perception in numinous action. One doesn't have to be on the other side of the nierika for long, or often, to be transformed by it for the good and to use its teaching in formative and informative ways. Symbiotic Existential Cosmology is an example of this. Also one doesn't have to do 100,000 prostrations or daily pujas, so one can get on with the good work of redeeming the material world and the social world with love, compassion and scientific insight.

Symbiotic Existential Cosmology is an empirical quantum cosmology complemented by the mind at large, and so has deep commonalities and yet fundamental differences from the mind-primacy of the Eastern tradition. Aurobindo in his idea of soul evolution had a very similar view to the view of Symbiotic Existential Cosmology, in which the universe is capable of moving toward a point of consummating consciousness among its biota in our integration with biodiversity and exploring the abyss of conscious existence through meditation and entheogenic experience. Both visions share a sense of the cosmic mind coming alive through the participation of the conscious sentient beings within the universe.

Aurobindo notes the way in which the heights of the Eastern mystical experience have also, in a sense, left the spiritual corpus behind:

The refusal of life of the ascetics who concentrated on the transcendent divine beyond form; the revolt against gross matter, as the later, medieval, scholars would call it, which dominated Indian spirituality for quite some time—but was not emphasized in the ancient texts—has its place in the evolution of consciousness. Due to this, the psychology of heightening oneself has been worked out in great detail in the Indian tradition. Yet it is important to acknowledge that this is a realization at the summit of the consciousness while the outer nature remains untouched. Or, to say it in the terminology of Indian psychology, in order to realize the Purusha, Prakriti is left behind and uncared for. It is now time for a reconciliation of matter and spirit.

Aurobindo places the evolution of consciousness as occurring before the big bang and subsuming physical reality. Symbiotic Existential Cosmology remains open minded about this question.

In Aurobindo's view, this is followed by a process where pure consciousness involutes and conceals itself more and more by creating planes of consciousness of increased density, in order to create the density needed for physical manifestation:

According to Sri Aurobindo, in conformity with the oldest Indian scriptures, matter was created by the ultimate or supreme consciousness seeking manifestation. In order to manifest, supreme or absolute consciousness, starting from the full fluidity of the spirit, created graded planes of being, till it reached the state of manifesting the solid density of matter. Sri Aurobindo calls this the process of Involution. The involution of consciousness is the process in which the Supreme or Absolute conceals itself more and more by creating planes of consciousness of increased density, in order to create the density needed for physical manifestation. In each of the planes that were created during the involution, (called typical planes or graded worlds) the absolute or divine consciousness veiled itself increasingly till it was able to produce and manifest the various forms of solid matter. In the solid matter of the stone the ultimate consciousness is completely veiled in what Sri Aurobindo calls 'an exclusive concentration', in which this absolute consciousness is present in the atom in the movements of a specific number of protons and electrons through which it keeps up that specific form of matter. He continues to explain that in matter the ultimate consciousness is concealed, but the Will of the ultimate consciousness behind this evolutionary process is a gradual unveiling till it reaches a full manifestation of divine life in matter. In other words the evolution or unveiling of consciousness started from the time solid matter manifested.

But the Will of the ultimate consciousness behind this evolutionary process is a gradual unveiling till it reaches a full manifestation of divine life in matter in the process of biological evolution.

...what evolutionary Nature presses for, is an awakening to the knowledge of self, the discovery of self, the manifestation of the self and spirit within us and the release of its self-knowledge, its self-power, its native self-instrumentation. It is, besides, a step for which the whole of evolution has been a preparation... It is only upon earth that the psychic life begins, and it is just the process by which the Divine has awakened material life to the necessity of rejoining its divine origin. Without the psychic, Matter would never have awakened from its inconscience, it would never have aspired for the life of its origin, the spiritual life.

Fig 201: Cosmos as coitus: (Left) The Cakrasamvara Tantra in consort with Vajravārāhī, (Right): Vajravārāhī dominant.

Symbiotic Existential Cosmology sees consciousness as complementary to the physical universe and thus doesn't invoke a functionally mentalistic process of involution of consciousness to explain matter, as they are asymmetrically symmetry-broken complements, each reflecting the other. It thus differs from soul evolution in that it is not just a return to soul, as if nature is just a supporting vessel. It invokes consciousness and the

physical universe as a complementary Tao, or more specifically a fully Kaula Tantra rite of Yamala. Symbiotic Existential Cosmology avoids the problem of consciousness making the physical universe because it conceives of cosmic conscious as a state we approach asymptotically through opening the doors of perception, while primal subjectivity, like the universe, is vestigial at the cosmic origin, thus we don't have to try to explain the physical universe as derived from involutions of consciousness, which we know to be a primarily organismic climax in biological evolution.

The universe is a then sexual union between cosmic consciousness represented in Shiva, and Kali, as cosmological fecundity of the physical, manifest in time and evolution. In doing so it sets nature on the same level of sacredness as cosmic consciousness, not merely below or a precursor to it. There is not a higher spiritual realm, but a fully integrated phenomenon of emergent Paradise on the cosmic equator containing enlightened incarnate beings, not just disembodied spirits.

There is a caveat about pure conscious dominion over reality. As the conscious aspect becomes disengaged from its own incarnate embodiment in the biota, so it loses its sense of integration with life as a whole and its capacity to survive long term enough to reach climax. This changed perspective, elevating nature to the fully sacred, is a direct product of the entheogenic experience of integrated consciousness shared within the natural fabric by the interspecies relationship with the sacraments. Ignorant people will use mushrooms just for "kicks", but they contain this deep well of the conscious abyss which evokes a shamanistic rather than just higher and higher spiritually elite conscious realms.

Likewise the cosmology derives the key aspects of its comprehensive view by being true to the empirical science of observation of nature and uses this careful verified scientific empirical method to elucidate the whole view of the

sacredness of nature, from the fractally emergent interactive mandala of the standard model evoking atoms molecules organelles and tissues, through subjective conscious intent implying panpsychism and animism to symbiosis being the key principle of the climax evolving biosphere. By being fully grounded in nature the intuitive presumptions of pure consciousness are found to be incomplete in just the same way the physically materialistic description of science is incomplete about mind and consciousness.

Spiritual paths, from Gnosticism to Tibetan Buddhism, tend to create very ornate spiritual realities, from the pleroma to realms of the Titans to Hungry Ghosts and even more ornate visualisations of spirit entities and the eventual downfall of the entire cosmological edifice, that become their own phantasmic cosmologies unbound to the sap and dew of life itself. I also have deep reservations about Buddhist philosophies of emptiness. See my [later comments](#) on Shiva-Shakti fertility and a critique of Nāgārjuna's philosophy of emptiness, denying inherent existence.

The absolutely key issue is that humanity, whether by business as usual, or religious spiritual elitism, has so far failed the acid test of symbiotic respect for the biosphere that ensures the very evolution that Aurobindo is seeking to realise. This can happen only if the conscious biota retain integration with life as a whole over the full evolutionary times scale of Paradise on the cosmic equator. Furthermore, Paradise is the whole shebang, incarnate, enlightened, consciously eternal and biologically immortal as one is to one, in our living diversity in wholeness, abundance and resplendence. That is the complete story of the fulfilment of the totality the conscious universe is here to become. So the picture is subtly different from the pure wisdom tradition.

Vinod Sehgal: Do you think that Siddhi of materialization and other Siddhis as mentioned by Patanjali in Yog Darshan Sutras depend upon the scientific certification by scientists in their labs? Do you think that, by the provocation by scientists or any other persons, any Yogis shall come to the labs of scientists for examination of their Siddhis for their scientists and fulfil the doubts of skeptics? If you think so, you are highly mistaken and lack a total understanding in reading and knowing the mindset of such Yogis as possessing genuine Siddhis. Sage Patanjali has specifically forbidden in Yoga Sutras to not demonstrate any Siddhi, whether for scientific or non scientific purpose. There are high chances that any yogi who starts demonstrating Siddhis can loose all their Saadhnaa or spiritual development. There are high chances that any person playing with the fire of Siddhis may burn his own hands and fingers.

Chris King: I am on a vision quest. It is older than, and just as powerful as the Vedic tradition of the Upanishads, because it is unfettered by any limiting doctrine such as renunciation. I don't submit myself to scientific tests or proofs of non-ordinary experiences, but neither do I make unverified claims to trivial siddhis such as materialisation. Rather than expressing beliefs, I work cleanly as a biocosmologist in both the scientific and visionary paradigms without conflict.

You are professing beliefs in the guise of established facts and providing no evidence of any kind scientific, or first person experiential affect. The fact that you have to refer back to Patanjali two thousand years ago (Purohit 1937) shows how doctrinal and non-existent the living evidence for actual siddhis or enlightenment has become

In the Western tradition, Monotheism has been rightly accused of distorting the nature of nature to invoke a clockwork-like creation, in which humanity reigns supreme over nature, but is supplicant to God, in an eschatology that ends in the destruction of nature and supposedly divine eternal "moral" judgment. It took Copernicus to upset the flat Earth Monotheistic view of creation. In the scientific era this has involved denying evolution and the capacity of nature to evolve new life forms such as ourselves. Vedanta also tends to a similar "heresy" of nature, by regarding organisms as purely sentient beings in a round of reincarnation used as an excuse for the difficulty of achieving enlightenment. This affirmative religious view is in frank collision with empirical science and the diversity of living species and their genetic bases in a robust evolving biosphere is unacceptable in terms of the pursuit of truth.

The Upanishadic view has, in world cultural history, shown great hope of a more enlightened, informative approach, where the individual is encouraged to seek the Brahman that is the form of cosmic consciousness that transcends the individual atman. However it is an abuse of the Vedic tradition to use the same religious stratagems as Monotheism to claim siddhis like materialisation, which is claimed to be material, without either objective physical evidence, or even first person accounts that accumulate to any form of reliability. Your claims that it would be foolish for a yogi to demonstrate the natural truth of their claimed powers is a spoiler on any pretence of verifiability either subjective or objective. As long as this pretence goes on, the Upanishadic path remains a diminished religious belief having little or no natural significance unless and until the situation changes.

Again I would point out that while I do have and have had, siddhi-like prophetic experiences, none of them are worth a tin can of salted fish, unless I can help humanity come to terms of protecting the diversity of life on this planet, so it and the human species can continue to survive and discover ourselves in cosmological time.

The Upanishads were written around 700 BC and nothing has really changed since apart from the Shakti-Shiva notion of complementarity at the cosmic origin which is confluent with Symbiotic Existential Cosmology. This is a real life condemnation of the Upanishads – perhaps the most promising vision quest tradition to have ever emerged in human history.

The key to science as the pursuit of the truth in the discovery of nature is the sceptical principle, that the onus is on the claimant of a theory or observation and not the respondent and it works for both objective empirical observation in science and by affirmed empirical subjective experience as complementary tests. In physical and biological science, it is based on a very low probability of a chance effect. The same is true in criminal law beyond reasonable doubt and in civil law under the balance of the probabilities. To reverse this sceptical principle and place the onus on the respondent is the affirmative/imperative route to religious doctrine and despotism rather than the pursuit of truth.

The vision quest is a first person discovery journey into the deepest abyss of the conscious experience. It doesn't have to be performed in a laboratory using statistical methods. The subjective route is for people to make the journey into the abyss for themselves and return with grail insights to share with others setting out for themselves on this great journey. When psychonauts have similar or complementary experiences, these affirm the nature of non-ordinary reality by mutual first person agreement, setting up the process for all sentient beings to discover the core nature of the living conscious universe.

There is absolutely no possibility of getting anywhere on this journey while Vedantists continue to use only religious belief in Patanjali or Sai Baba or Maharishi as a basis for superficial levels of meditation and don't bring back in the first person serious journeys into the unknown which reflower and refresh the tradition and above all result in the unfolding of life immortal, in symbiosis with the biosphere.

Ram Vimal: Yogananda's and Kriyananda's methods of materialization are not easy and I am not sure they will materialize thought. However, you are most welcome to try them, and let us know if you are successful!

Here is a first technique of Yogananda you may practice, using a room or an apple as an object for your visualization:

I can keep looking at this room and concentrating upon it until, when I close my eyes, I can still see the room exactly as it is. This is the first step in deep concentration, but most people haven't the patience to practice it. I had the patience. As you continue to practice visualization you will find that your thoughts become materialized. The cosmic law will so arrange it that whatsoever you are thinking of will be produced in actuality, if you command it to be so. Suppose I am thinking of an apple, and the apple appears in my hand. That would be a demonstration of the highest power of concentration.

In order to realize that all the happenings of this world are dream experiences, we should learn how to visualize our thoughts-how to recharge them with the energy of concentration until they become visible manifestations. Proper visualization by the exercise of concentration and will power enables us to materialize thoughts, not only as dreams or visions in the mental realm, but also as experiences in the material realm. From the causal thought-forms, the astral body's five instruments of life force [the 5 pranas] make visible the astral body of light and the physical body of gross matter. Dreams and visions are astral in essence, being composed of light and energy. As you continue to practice visualization you will find that your thoughts become materialized. The cosmic law will so arrange it that whatsoever you are thinking of will be produced in actuality, if you command it to be so.

Chris King: I like Yogananda's (1950) autobiography, but his technique is claiming real world experience is just a form of dreaming reality, and with a supreme degree of focussed attention, we can make this physical reality. I don't accept this. It has profound consequences and arises from the notion that conscious experience makes matter.

Dreaming experience can conflate absolutely anything. I can have 360° vision, like Yogananda claimed, and see whole urban vistas and fly through landscapes. Frogs can turn into fish and cars we don't own can become crammed full of our possessions while we can't anywhere find the keys to drive them home. I can find myself in a huge witches mouth or become stranded in a dream world and search the sky trying to find my way back to Earth. Only in waking experiences do monkeys give birth to monkeys and sharks to sharks and that is what makes conscious life possible in

the evolving natural universe. So conflating dreaming and waking reality collapses biology into the dreamtime and cosmology into allegory.

This is an error of Vedanta and it comes from the mistaken view that all life forms are just subjective sentient beings trapped in reincarnation. That's not how cosmology works and it's not how subjective conscious volition complements physical reality either. **That's precisely why SEC says consciousness is primary, but the universe is necessary!**

Ram: If you want to use visualization not to materialize an object, but to make a project happen, or to obtain money, the technique and procedure is a different. You visualise not so much the details (of the apple, of the room, etc.), but you concentrate on the general result.

Chris: This quest is irresponsible and leads to karmic finesse. Why put so much effort into focussing one's thoughts on such menial quests, ignoring, the real existential crises of the future of life and its meaning, that do realise enlightenment? If we are focussing on not the money but the object of our quest e.g. an easier ride home, a plethora of future circumstances may be claimed to validate it.

BVK Sastry: Can you tell me your engagements and experiences with Yoga-Traditions of India Patanjali or Tantra or others – or the current teachings–practices–public perception as seen are a terrible mix up

Chris King: I meditate by using two complementary processes: (1) Eyes open mindfulness concentrating to abandon all thoughts. (2) Annihilation with eyes closed or half open, breathing and glancing out of the corner of my eye to completely let go.

Fig 202: Left and right-brained consciousness.

I generally do this only when tripping, to enter into the deep entheogenic state. That might be only very occasionally, say once a year, so I am in a kind of incipient meditative state the rest of the time, including periods of quiet abandonment and my psyche is kind of divided between a chaotic “right brain” aspect listening to the winds blowing past the window connected to my left hand and witnessing the “left brain” everyday world of thought and planning, noting that I am left-handed!

Like a Shiva sadhu, I eat cannabis butter daily and swoon out into the mild trance this evokes and watch my dreams as much as possible, but I use psilocybe mushrooms as my entheogenic sacrament. They are my shamanistic ally and bring on my Brahmanic apotheosis, which is a kind of altered state where I meet my cosmic self and regain conscious integration with what you might call the “spirit world” for want of a better term, meeting the Totality in a kind of near death experience, where I could go to the other side (death) but return to ongoing life because I’m not having a heart attack or a car accident and that is the covenant to complete the long journey of life. In this state I become intuitively conscious of a background experience which is like a telepathic awareness of all living beings throughout space-time as disincarnate entities in communion, but I don't take any of these experiences literally or believe in them religiously.

When I’m tripping I am trying to simply do deep annihilation meditation to try to descend into the disembodied state that is visionary reality. I generally slide out of my ordinary consciousness into a kind of abstract synesthetic world of resonating sounds and abstract visions which can rapidly turn into visionary states the Huichol shamans describe as passing through the nierika portal to the spirit world of the ancestors. There is a way of listening to the whisperings of the sounds and patterns which causes one to go to the other side.

The experience of the journey there and back when it happens full on is sufficiently transformative to constitute a lifetime mystical experience which I can go for months of ordinary consciousness knowing that even when I am not experiencing it in this way, it is nevertheless the sacred ground of my conscious being. I don't have to rate it as transcendent but it IS and it is falling outside my incarnation into the reality at large that is the conscious awareness of all sentient beings. I have been tripping all my life on a regular but occasional basis as my ally, advisor and informant complementing my scientific view of natural reality. Lots of times, realisation only happens partially but it is still formative on my being and brings me back to the source of all conscious existence.

Christianity is an avowedly sacramental religion but the Eucharist is cannibalistic – soma and sangre, eating and drinking Christ's flesh and blood, so its a dead sacrament waiting for biospheric fruition. The idea of a visionary sacrament is an anathema to Christians who are plagued by heresies, from the gnostics claiming Jesus and Mary Magdalene were lovers, to the European witches taking deadly nightshade, which explains why psychedelics have been regarded as diabolical heresies to the consumer capitalist status quo in the 20th century.

Vedanta is also historically and actually sacramental, from the Soma of the Aryans to the Ganga of the Sadhus, likewise waiting for the sacraments of the Americas that the Eastern tradition missed out on ecologically, although Psilocybe cubensis mushrooms have been associated with Brahman cattle in South East Asia.

Sacramental shamanism is older than any religion and I am of the opinion that evolution arrived at our sappy chemical brains and in parallel evolved psychoactive species out of a common cosmological process that gave rise to consciousness in single-celled eucaryotes, so that the confined world view of a dominant species like humanity that can get lost in egotistical grasping can reintegrate with cosmological conscious reality and live throughout our generations in symbiotic unity with the diversity of life in our biosphere. So I have it in mind to fulfil the Western sacramental tradition of "Soma and Sangre" through rebirthing the biospheric sacraments, and to fulfil the Vedantic tradition through the Tantric marriage of the path of meditative renunciation as Shiva with the sappy life-engaging flow of the sacraments as Shakti, which is already incipient in the sadhus' use of cannabis as a meditative ally.

Ram Vimal: As I mentioned, SaS (self-as-subject) is not eternal because it eventually returns back to its source (dual-aspect substrate at unmanifested state) after many reincarnations/rebirths as per the principle of karma.

Chris: Both Vedanta and Buddhism postulate reincarnation of pure sentient conscious beings. But physical biology has all conscious organisms breeding true with only small mutational changes. You can't postulate reincarnation that allows a bad man to become a crocodile. How does he think? Will he ever regret his actions? Have you ever seen a regretful crocodile? That's the irony of crocodile tears speaking! What kind of mentality is it to be reincarnated as a flea?? If you then say humans reincarnate as humans do fleas do so as fleas? Why? What sense does this make of biology and cosmology? Why would the universe evolve to this end? You need to admit that reincarnation was invented because Samadhi never comes in the average lifetime. It's a toxic consolation prize to the diversity of life!

John Kineman: It is interesting to see these strong assertions, Chris, when so much else that you write I agree with.

Chris: I think you are trying to make a mistaken defence of the Vedic tradition when your incarnate duty is to the immortal survival of life. I am here to protect your descendants and the diversity of life period.

John: Let's take the idea of attributing moral meaning to reincarnation and the idea that there is "no cosmic morality". This means that moral meanings are human inventions, aside from our otherwise naturalistic essence. But how do we invent something aside from our use of natural means, if that is what is claimed we are?? The logic creates an inverted pyramid resting on a non-existing point. It builds and builds in its denial of natural essence. In contrast, adopting the view that the foundation is a complex unity of material and spiritual (meaning "of spirit" vs matter) essence, we can see how forms of morality can emerge from that relation at many levels and in many forms.

Chris: This is a figurative argument but is in conflict with reality. There is no inverted pyramid. Moral meanings are NOT human inventions, they are emergent properties of intelligent animal sociobiology, exploited by religious systems to ensure cultural dominance. Richard Alexander (1987) wrote the *Biology of Moral Systems* contemplating human nuclear mutually assured destruction. He is right. This began on a tribal basis with totem deities and has continued ever since. Indra for example is a typical thunder god of war that is a second generation tribal deity. He is associated with the sky, lightning, weather, thunder, storms, rains, river flows, and war. Indra's myths and powers are similar to other Indo-European deities such as Jupiter, Perun, Perkūnas, Zalmoxis, Taranis, Zeus, and Thor, part of the greater Proto-Indo-European mythology. My Indian name is Yogindra Baba named by the Santana hotel in Puri in 1976, the site of the Jaggernath juggernaut which devotees threw themselves under the wheels of. We could likewise explore the veracity of these beliefs. I know we agree on many points and you know that my inspiration comes partly from the Upanishads, but reincarnation has no more validity than the day of judgment. This isn't just about science vs religion, but the pursuit of true knowledge. I am here to defend the diversity of life sine qua non as a prima facie vision quest. We have to learn to be honest with ourselves if we want to survive as a species.

John: Why do you think moral beliefs are not natural and relative to the systems they pertain to? And why, if they are, would they not have a natural foundation?

Chris: Of course they do have a natural foundation, but they also have a relevant context and that is in encouraging intra-social cooperation and individual sacrifice to achieve inter-group domination and hence collective survival of the group against other similar and competing groups. Morality is NOT cosmologically ordained in the way Monotheistic and Vedic scriptures claim and we really need to respect that it is a limited concept based on competition. If we are going to ensure human survival in the closing circle of the biosphere, morality is inadequate, because it basically applies only to individual sacrifice and altruistic punishment to achieve group dominance. That won't save the biosphere or humanity because it is inadequate to get people to face the sanctity of life and is already being misused to promote religious and cultural dominance. If I would coin a Buddhist analogy, the suffering of the ego is not about morality but about mortality, and it is not about reincarnation or moral karma. It is mortality itself that teaches us that the only thing that matters is the survival of our generations in a surviving biosphere for the simple reason that for mortal biological beings, we can't take it with us when we go. The only meaning in life is to give back to reflower abundance and accept the vagaries of fate.

John: Well, I'm very familiar with that view but learned that there is a stronger case for cooperation than competition in ecology and evolution. Competition turns out to be more epiphenomenon than cause. It can't exist unless cooperation is at the foundation. Lions aren't trying to compete with anything, or to survive, they're just trying to eat and cooperating with nature is the best way to do that.

Chris: That's why existential cosmology is symbiotic!

Alex Hankey: If God is the Origin of Creation, and Dharma, Natural Law, is all about Growth of Consciousness, then morality has a Primary Place in the Meaning of Things.

Chris: We can't predicate life and existence on God or the concept of divine creation. We have to deal with things as they are with no assumptions because it all comes down to us. What we have within us will save us if we bring it forth from ourselves. Life itself is the source and is the source of the growth of consciousness. Dharma and Natural Law are classical concepts in a non-classical universe. The true dharma is life immortal. Compassion transcends morality.

John: Sorry, that reads like the handbook for insanity. I'm sure you mean 'for the purposes of science', but even so we can't lose site of origins.

Chris: It's not about science John. It's not about a description of reality. It's simply dealing directly with existential reality. We are the sentient witness to the existence of the cosmos. We simply have to take responsibility for the fate of life in the universe. We can't reliably depend on the assumption of deity and creation by deity.

Chris said: Karma is not a moral law but the integration of entropy, quantum uncertainty and synchronicity if you will.

John: This is replacing fundamental existence with description; like going to a fine restaurant and eating the menu.

Chris: On the contrary it is going far far beyond morality. The mystical condition IS cosmological. The secrets of the totality are in the way nature manifests, not in cultural doctrines of dharma. I can't help but describe the undecipherable to you in a simple transparent way. Sure it may sound to you like a description but its purpose is manifest. Spiritual reality is the universe becoming. It's not a moral invention or creation. How else do you expect me to explain it to you? We know the way that can be told is merely a description.

Karma contains the siddhis and is our ultimate teacher. Life is rough justice, fulfilment is a luxury and there are no guarantees of a good outcome, but together we can produce overflowing abundance and express true love, sexual and spiritual, because the spiritual arises from the wonder of sexual procreation and the passage of the generations forever as long as Paradise last on the cosmic equator in space-time. This is a radically different weltanschauung. It really is the remedy, but that's a hard saying!

Entheogens are intrinsic to the Yoga tradition:

Patanjali notes: *The Siddhis are born of birth, drugs, mantras, penance or Samadhi. (IV-1) Powers are either revealed at birth, or acquired by medicinal herbs, or by repetition of sacred words, or through austerity, or through illumination. All know the healing qualities of herbs; only a few know that some of them have the qualities of awakening spiritual powers.*

Ram: Can you please try performing the experiment I mentioned whenever you have dissociative OBE?

Chris: Patanjali's Aphorisms on Yoga, in my own Purohit Swami edition (1938) says of siddhis: These powers are obstacles to illumination. They have their value so far as this world is concerned but they obstruct the progress of the soul so far as its liberation is concerned. The power they give is an encumbrance, unless it is brought under control.

I am not prepared to exert control or distort the flow of karma from that which is freely manifest to my consciousness as the circumstances emerge. Demonstrating siddhis is a curse upon them. It is attempting to manipulate powers that arise adventitiously without warning and may not repeat and it is interfering in the natural process of unfolding reality. I have suffered plenty of karmic predicaments threatening my very survival to know and respect the risks.

Siddhi arise from karma. Karma is not simply a moral force, but much deeper, entwined in the quantum uncertainties of fate. It is not a moral law but the very foundation of conscious idiosyncrasy, in prescience, synchronicity and misfortune. We have no explanation for why one person escapes a disastrous fate and another gets a terminal illness when the one escaping may be a bad person and the one expiring may be a very good one. It doesn't just come down to morality and we have no control over it except through our prescience and careful attention to the flow of life, as well as intelligently avoiding risks. You simply can't afford to manipulate it for superficial effects, or other outcomes may result which are very harmful to you or others.

I have to try to balance three things, (1) astute ego to protect me and take on the world at large, (2) complete annihilation to merge with karma with no predilection, and (3) mortal compassion to protect all life because that is my covenant with Brahman-Ishvara – Om Nama Shivai.

John: Well said that "Spiritual reality is the universe becoming". This is where we find common ground. Maybe the corollary is that scientific reality is what became? Let me clarify that I'm not really disagreeing, I'm pointing out that the sciences are forced into such epistemology, but we as experiential beings do not have to be and in fact cannot afford to be on a human level. So both views have to be understood.

Chris: Let me say back to you – thank you John! How to express this and turn it into a world reflowering in one day standing on one leg is a real challenge. What I am trying to do is go out to battle for life in the style of the Gita I am singing the Song of God, between between Arjuna and Krishna. My chariot is the weltanschauung of immortality throughout our generations. The battle is worthy and just, even though treasured icons may pass away!

John: This raises a very fundamental question about epistemology and the foundations of science and belief. In the sciences, which have been my profession, we adhere to the idea that propositions must be tested against data, or at least inferred from theories that have been well-tested on other data. In spiritual pursuits and religious practices one is attempting to overlook smoke-screens presented by the senses to see and experience a deeper reality through direct participation. As science developed to its present state we came to realize that the observational reality cannot be complete. This is not a direct answer – I don't want to agree or disagree, but to point out that there are and it seems always will be things we don't know about reality, and that may be the most important thing we can know about it. It is greater than us. That realization does not preclude "taking responsibility" - it requires it.

Chris: The entire purpose of conscious existence is to unfold the existential universe, so yes it is a journey into the unknown, but not the unknowable, so I see this statement as coming too close to a doctrine of human fallibility. So let's look at the evidence you have presented.

John: Incompleteness proofs that say no description of reality can ever be fully accurate or fully meaningful.

Chris: Godel's theorem⁵⁷ is dealing only with axiomatic model system descriptions. Laotzu said: "The way that can be told is not the countless way". But he didn't say "The way that can be experienced is not the countless way."

⁵⁷ Godel's first incompleteness theorem states that no consistent system of axioms whose theorems can be listed by an effective procedure (i.e., an algorithm) is capable of proving all truths about the arithmetic of natural numbers. For any such consistent formal system, there will always be statements about natural numbers that are true, but that are unprovable within the system. [An example is whether there is a cardinal number between the rationals and the reals]. The second incompleteness theorem, an extension of the first, shows that the system cannot demonstrate its own consistency.

John: This to me indicates that the way forward from here is to work out the relation between these two ways of knowing reality. As we have seen even the idea of direct participatory knowing, personal experience, may have problems reaching ultimate reality.

Chris: The vision quest IS the countless way of direct experience and is not inconsistent or incomplete except that it is complemented by science.

John: It is claimed to be reachable but apparently [only] in very special cases (Moksha, Samadhi, ascension, etc.).

Chris: The special cases “prove” the rule.

John: Similarly in science there is the “epistemic cut”. *Howard Pattee has claimed that an epistemic cut separates the world from observers and therefore from organisms. The epistemic cut imputes a linguistic mode of operation to living systems. In Pattee’s words: Evolution requires the genotype-phenotype distinction, a primeval epistemic cut that separates energy-degenerate, rate-independent genetic symbols from the rate-dependent dynamics of construction that they control.*

Chris: Howard Pattee is an engineer making symbolic claims about genetic systems. I see these claims as reducing how DNA molecules work as quantum systems to symbolism and they are inaccurate about regulatory non-coding DNA which is responsible for higher organism phenotypic evolution, so his distinction between genotype and phenotype is fallacious. I don't accept the epistemic cut any more than epistemic humility ⁵⁸.

But we need to do more than grasp it. We need above all to **protect** the world in itself, so the only epistemic humility I am prepared to accept is biospheric symbiosis, in humility to the diversity of life unfolding. This is not a scientific description, or proposition, but a dire necessity and central to the meaning of the vision quest. What you are saying is that descriptions of reality are not reality. This is true and it is the reason why I apply the manifestation test to experiential empiricism. That is, experiential empiricism needs to be a manifest account of a conscious experience, not a description of a model of reality, which is an abstract objective outline of the concept of the experience. Most SBoC discussions are model theoretic or traditional Vedic. Furthermore I see accepting full personal responsibility as a critical step for humanity to take if we are ever going to survive our own self-appointed maladaptions to nature. Fallibility is a pathetic fallacy of an excuse. There is one kind of responsibility when we recognise that the buck stops with us and all the descriptions we make, from deity to mechanism are just ways of abnegating full personal responsibility, that we cannot as mere humans address the central existential questions. But there are no other manifest experiencers in the universe outside life’s diversity.

John: But I think we can say that a “description of reality” must intrinsically be incomplete. Descriptions are by their design different from what they describe. Only when description itself is incorporated into the concept of reality can a description encompass all that exists, but in that case it creates an infinite regress, like a video camera pointed at the screen displaying the same camera’s view.

Chris: The description is incomplete, just like eating the menu you described. But the vision quest is not an infinite regress any more than the scent of a rose. The only resource we can dependably rely on, even on a temporary basis is our direct experience. Outside that, it is all presumption and we can't afford limiting a priori assumptions like God is greater, or mechanism has it all sewn up so we cannot know ourselves or the world at large.

John: There are and it seems always will be things we don't know about reality, and that may be the most important thing we can know about it. It is greater than us.

Chris: Is it greater? Or are we the essential ingredient at the very centre of the cyclone – the key factor in whether meaning in the universe will survive? The anthropocene has ended our gatherer-hunter childhood and the religious adolescence of our species. We are now at a make or break point for Fermi self-extinction and have to become mature adults and take full responsibility for our actions. We have to take extreme care and show our true compassion, but not limit ourselves by claiming fallibility at the outset.

John: All excellent points. I'm prepared to accept that the goal can be reached by responsible experiential means. The only block that relational theory is that there is no syntactic path to the subjective or the whole. So it supports your thesis. By remarks about infinite regress refer to a theoretical vs participatory approach. I can't comment on the possibility of complete transcendence through personal performance. My gut says that is also a path of endless learning, but how would I know? It's not analyzable like science is.

⁵⁸ In the philosophy of science, epistemic humility refers to a posture of scientific observation rooted in the recognition that (a) knowledge of the world is always interpreted, structured, and filtered by the observer, and that, as such, (b) scientific pronouncements must be built on the recognition of observation's inability to grasp the world in itself.

An Anthropology of the Soul or Spirit

In these examples, you will find a great diversity of views on one or many souls humans conceive and their immortality or otherwise. These differ entirely from the materialist scientific description of nature, in which human consciousness is a manifestation of brain function, which ceases to exist on the death of the organism.

Many traditions, from Ancient Egypt, Hinduism, Judaism and Christianity to Austronesian peoples, identify soul with breath. The identification with breath is organismic, because the breath is both voluntary and autonomic, indicating the interface between subjective conscious volition and natural biology.

As we have noted, animism the idea of souls and other spiritual beings pervading life and will in nature is a founding human belief in all natural features entities and phenomena having spirits or souls, that form the vital principle of life and that the normal phenomena of and the abnormal phenomena of disease could be traced to spiritual causes. Thus every human has, in addition to his body, a 'ghost-soul', an insubstantial human image, the cause of life or thought in the individual it animates, capable of leaving the body far behind' and continuing to exist and appear to men after the death of that body. Animism differs from pantheism in that animism puts more emphasis on the uniqueness of each individual soul. In pantheism, everything shares the same spiritual essence, rather than having distinct spirits or souls. It also shows the source notion from which religious ideas of the eternal soul later evolved.

Anciently among the San bushmen we hear: ≠Gao!na, tallest of the Bushmen, was in his earthly existence a great magician and trickster with supernatural powers, capable of assuming the form of an animal, a stone or anything else he wished, and who changed people into animals and brought the dead back to life. But as the Great God who lives beside a huge tree in the eastern sky, he is the source and custodian of all things. Thus their hunting and gathering way of life was ordained from the very beginning and ≠Gao!na ordained that when they died they should become spirits, // Gerais, who would live in the sky with him and serve him.

By contrast, in Amazonian Shipibo cosmology, every tree and plant has its indwelling spirit, which forms the principle of its life and growth. When a tree is felled, this is regarded as an offence against its spirit. Every tree has what the Indians call its "mother" (and which he equates with "soul"). Human progeny come from the watery depths and flow upward like the souls of the dead, which rise up the World Tree through its roots, which penetrate the underworld. Several Inuit groups believe that a person has more than one type of soul. One is associated with respiration, the other can accompany the body as a shadow.

In Shamanism, soul dualism ("multiple souls" or "dualistic pluralism") is a common belief and is essential in the universal and central concept of "soul flight" ("soul journey", "out-of-body experience", "ecstasy", or "astral projection"). In some cases, there are a plethora of soul types with different functions, such as nature spirits of trees and rivers. It is the belief that humans have two or more souls, generally termed the "body soul" (or "life soul") and the "free soul". The former is linked to bodily functions and awareness when awake, while the latter sometimes called the *Nagual*, as opposed to the *Tonal* of the day, can freely wander during sleep or trance states.

Soul dualism and multiple souls are prominent in the traditional animistic beliefs of the Austronesian peoples, the Chinese people (*hún* and *pò*), the Tibetan people, most African peoples, most Native North Americans, ancient South Asian peoples, Northern Eurasian peoples, and in Ancient Egyptians (the *ka* and *ba*).

The Proto-Austronesian word for the "body soul" is **nawa* ("breath", "life", or "vital spirit"). It is located somewhere in the liver or heart. The "free soul" is located in the head **qaNiCu* ("ghost", "spirit [of the dead]"), which also apply to other non-human nature spirits. The "free soul" is also referred to in names that literally mean "twin" or "double". A virtuous person is said to be one whose souls are in harmony with each other, while an evil person is one whose souls are in conflict. The "free soul" is said to leave the body and journey to the spirit world during sleep, trance-like states, delirium, insanity, and death. Illnesses are regarded as a "soul loss". To heal the sick, one must "return" the "free soul" (which may have been stolen by an evil spirit or got lost in the spirit world) into the body.

Looking to major human cultures, notions of the soul or spirit, are also varied.

The ancient Egyptian *ka* (breath) was a "soul" that survived death but remained near the body, while the spiritual *ba* proceeded to the region of the dead.

The Chinese distinguished between a lower, sensitive soul, which disappears with death, and a rational principle, the *hun*, which survives the grave and is the object of ancestor worship. According to Chinese traditions, every person has two types of soul called *hun* and *po* (魂 and 魄), which are respectively yang and yin.

Taoism believes in ten souls, *sanhunqipo* (三魂七魄) "three *hun* and seven *po*". A living being that loses any of them is said to have mental illness or unconsciousness, while a dead soul may reincarnate to a disability, lower desire realms, or may even be unable to reincarnate.

Shinto distinguishes between the souls of living persons (*tamashii*) and those of dead persons (*mitama*), each of which may have different aspects or sub-souls.

The Monotheistic religions of Judaism, Christianity Islam and Zoroastrianism share a view of all humans possessing or being possessed by a soul which is the spirit of life's agency.

In Zoroastrianism the final renovation, all of creation—even the souls of the dead that were initially banished to or chose to descend into "darkness"—will be reunited with Ahura Mazda in the *Kshatra Vairya* (meaning "best dominion"), being resurrected to immortality. In Middle Persian literature, the prominent belief was that at the end of time a savior-figure known as the *Saoshyant* would bring about the *Frashokereti*, while in the Gathic texts the term *Saoshyant* (meaning "one who brings benefit") referred to all believers of Mazdayasna but changed into a messianic concept in later writings.

The Hebrew terms נפש *nefesh* (literally "living being"), רוח *ruach* (literally "wind"), נשמה *neshamah* (literally "breath"), חיה *chayah* (literally "life") and יחידה *yechidah* (literally "singularity") are used to describe the soul or spirit. The early Hebrews apparently had a concept of the soul but did not separate it from the body, although later Jewish writers developed the idea of the soul further. In older writings the dead go down to sheol.

"Then the LORD God formed man of the dust of the ground, and breathed into his nostrils the breath of life; and man became a living being" (Genesis 2:7).

Soul or psyche is "to breathe", (Latin 'anima'). It comprises the mental abilities of a living being: reason, character, free will, feeling, consciousness, qualia, memory, perception, thinking, etc. These are precisely what scientists call the conscious mind so it's already subject to scientific investigation.

The Christian view contains three different soul origins. The major theories put forward include soul creationism, traducianism, and pre-existence. According to soul creationism, God creates each individual soul directly, either at the moment of conception or some later time. According to traducianism, the soul comes from the parents by natural generation. According to the preexistence theory, the soul exists before the moment of conception.

The Kabbalah separates the soul into five elements, corresponding to the five worlds:[59]

- a *Nefesh*, related to natural instinct.
- b *Ruach*, related to intellect and the awareness of God.
- c *Neshamah*, related to emotion and morality.
- d *Chayah*, considered a part of God, as it were.
- e *Yechidah*. This aspect is essentially one with God.

The Platonic soul consists of three parts:

- a the *logos*, or *logistikon* (mind, nous, or reason)
- b the *thymos*, or *thumetikon* (emotion, spiritedness, or masculine)
- c the *eros*, or *epithumetikon* (appetitive, desire, or feminine)

Eastern religions encompassing Vedanta, including Buddhism share a concept of eternally reincarnated souls.

In Hinduism the atman ("breath," or "soul") is the universal, eternal self, of which each individual soul (*jiva* or *jiva-atman*) partakes. In the Brihadaranyaka Upanishad we are told that the Supreme Being is Pure Consciousness, in which subjects and objects merge together in a state of Universality. The Supreme Being knew only Itself as 'I-Am', inclusive of everything. This indicates that enlightenment arises from merging with the cosmic self after rounds of birth and

death and raises a different prospect to Monotheism, where individual eternal souls are believed to continue to exist forever.

Buddhism denies the existence of the self and teaches merely that individual souls are caught in an endless round of reincarnation until they reach enlightenment essentially a void state outside Maya or illusion, although Buddhist realms include levels of conscious existence from Titans to hungry ghosts.

In Jainism, every living being, from plant or bacterium to human, has a soul and the concept forms the very basis of Jainism. According to Jainism, there is no beginning or end to the existence of soul. It is eternal in nature and changes its form until it attains liberation. The difference between the liberated and non-liberated souls is that the qualities and attributes are manifested completely in case of *siddha* (liberated soul) as they have overcome all the karmic bondages whereas in case of non-liberated souls they are partially exhibited. The soul lives its own life, not for the purpose of the body, but the body lives for the purpose of the soul.

In Brahma Kumaris, human souls are believed to be incorporeal and eternal. God is considered to be the Supreme Soul, with maximum degrees of spiritual qualities, such as peace, love and purity.

In Sikhism "God is in the Soul and the Soul is in the God."

To William James (1902) author of "The Varieties of Religious Experience" at the beginning of the 20th century, the soul as such did not exist at all but was merely a collection of "psychic phenomena". This is probably a well informed position given the huge scope of his research into religious beliefs. It also coincides with views of animism as the founding human belief system preceding doctrinal religion. I have a real concern about the quest for individual eternal life because it leads towards a "crowded cosmos" of angels dancing on the head of a pin with no relationship to living existence and a distraction from the primacy of protecting and preserving the diversity of life as a dominant species.

Joshua Davis (2009, 2019 see also Gillett & Davis 2015): The way I read it, is that many more people aspire to eternal life for the wrong reasons in a self centred way, while fewer people aspire to eternal life for the right reasons in an altruistic and wondrous way.

Cathy Reason: But why is it necessarily better to do something for altruistic reasons than to do something for self-centred reasons? Why is everyone else's well-being always valued more highly than one's own?

Chris King: Relaxing ego is not valuing others more. It is an individual quest to avoid hungering that hurts oneself and life around us. More or less categorical reasoning is too black and white. If death is black and life is white, sentient existence has the many-splendid colours of living abundance. It is not balance, but survival at the edge of chaos.

Hal Cox: Is it something about dropping the ego? Or merging the ego with a larger Self? No ego, no suffering? This idea is passed to us by followers of Buddha, I guess, whose ideology seem to have ever increasing weight among the intellectuals in the West including notably famous atheists and other skeptics.

Chris: I reject Buddhism as a *via negativa* redeemed only by the Bodhisattva ideal. Love life! Don't hate the ego, heal it! It is our ally preserving life and our very vibrancy!

But there is more. Eternal religious cosmologies just make it harder to live in symbiosis with life as a whole. Monotheism leads to eternal life, eternal judgment and the Eschaton, in which life is discarded by God as a prop. Eastern reincarnation cosmologies do the same by imagining an endless round of birth and death leading to eternal suffering. Biological and physical life is mortal. To live in the universe involves entropy and a negentropic balancing act. The subject fears ultimate annihilation and then invents the possibility of life after death. This amplifies the dilemma of ego, so that instead of merging with life as a whole, we seek an eternal pinnacle.

Hal: Perhaps enlightenment is not the goal, but only an occasional accident. The goal is to drop the ego.

Chris: This is where Eastern cosmologies fail, because, without biospheric sacraments enlightenment is rarer than life itself. Biospheric sacraments let the ego dissolve naturally, given loving support, inducing a form of cosmic consciousness which IS enlightenment. That's just the way it is!

Hal: I was thinking you may consult with his assembly of experts on the anthropologies of perceptions in populations. Their insights are rare and not necessarily otherwise easily available for study. I do not know a serious anthropologist who has surveyed the population biology of psychical behaviors like NDE/OBE, but I do know of anthropologists in Mishlove's broader community who have deeply invested in select populations of experiences. First person subjective versus third person objective evidence is debated in these groups with a widespread *egoic* assumption that only first person singular matters. That's an incomplete but not wrong assumption in itself. A more complete investigation of subjective experience needs to encompass population behaviors at multiple scales, i.e. anthropologies of groups, tribes, societies, and cultures. Is there any special weight for the evidence of a population's experience in your analyses?

Chris: The approach of Symbiotic Existential Cosmology is not 1pp singular but 1pp affirmative. The subjective weighting is established by mutual affirmation between 1pp subjective empirical experiences, in a complementary manner to verified empirical observations in physical science. The scientific threshold is replication of an initial result i.e. two experiments agreeing, followed by more as it happens. This is complemented by statistical measures in each experimental process.

Hence the subjective threshold is two experiencing individuals mutually agreeing on their experiences but more is desirable, up to population levels. Experiments reporting subjective responses enables this to be done with valid statistical measures in the same way as scientific observational experiments. These two approaches can also be combined, with EEG and fMRI studies of individuals on psilocybin, complemented by subjective reports of their experiences such as relief of depression or positive spiritual experiences, both subject to statistical analyses.

There are whole classes of fringe phenomena, including synchronicity, forms of claimed Psi, prophetic experiences, claims of life after death via NDEs, which are actually living experiences of survivors as well as via mediums, and OBEs such as the case of Maria recounted by Groff (1988), from Grayson & Flynn (1984), in which a woman in short-term cardiac arrest saw a tennis shoe on the high ledge in the hospital that the doctor later discovered, at her behest, and so on that I think need to be kept in a separate category from true/false. They may be fundamentally uncertain in the sense that they can be experienced adventitiously, but not in a fully verifiable way, because like non-IID quantum brain dynamics they are part of the Schrödinger cat phenomena of the universe – one person can experience them fortuitously but can't guarantee to repeat the good luck of premonition. To me the worst thing we can do about prescience is to try to measure it in a classical or statistical way because that IS IID. The whole utility of synchronicity and prescience is that it is an omen that may never repeat.

Cultural belief systems are notoriously self-reinforcing. Christian doctrine has such a strong influence on its believers that it creates a form of totalitarian doctrinal disinformation, leading to creationism and belief in eternal life and eternal damnation. Vedanta does the same with subservient belief in yogic teachings as "science" and notions like reincarnation. But they're not the only ones. Psychedelic warrior societies with high rates of male homicide are obsessed with casting evil spells using psychedelics. What are we supposed to conclude from that? Believers in Psi and life-after-death create similar expectations.

I have to balance my insight as an egotistical individual having a teaching to save us all biologically and physically, with the party lines of major religions professing all kinds of supernatural beliefs, as well as hard core scientific materialists. I have to stand against the tide because I am carrying a unique personal insight which, in my own humble opinion when I face down these oceanic forces is essential to turn the tide. I keep looking at this legion, including the combined forces of Judaism Christianity and Islam when I went to Jerusalem, until I can "see the whites of their eyes" and sum up the veracity of their predilections against my own insights.

So I am not prepared to go gentle into that anthropological, "good night". When the chips are down for protecting life as a whole, you have to be able to decide to be a pure egotist, as Cathy said! If you are sure it is right to protect the diversity of life, just do it!

4 Psychedelic Agents in Indigenous American Cultures

The prominent use of much more potently transformative psychedelic agents in human populations has evaded the mainstream of philosophical and religious practice because it has been focused on the Americas, where *Psilocybe* fungi were consumed as *teonanactl* – “flesh of the gods” for spiritual and therapeutic purposes by the Mayans from 1000 BC, *Lophophora cacti* from 500 BC as *peyote* and species of *Psychotria* and *Bannisteriopsis* combined as *yage*, or *ayahuasca*, in the Amazon basin, with evidence also of the use of *Trichocereus cacti* by the Nazca (100-800 CE) and dimethyl-tryptamine containing snuffs (Schultes & Hofmann 1979, Williams et al. 2022).

For the **contemporary spiritual entheogenic movements** see: [Redemption of the Soma and Sangre](#), [Maria Sabina's Holy Table](#), [The Man in the Buckskin Suit](#) and [Santo Daime and the Union Vegetale](#).

Fig 203: Traditionally used psychedelic species provide access to a first person visionary experience, deemed to be of genuine spiritual significance by researchers (Griffiths). Top row Maria Sabina our benefactress, Gordon Wasson (see also fig 245). Sacred mushrooms, containing psilocin. *Psilocybe cubensis* (di-shi-tjo-le-ra-ja (“divine mushroom of manure”), Mayan mushroom stone with metate for grinding (1000 BC) Quetzalcoatl teaching nine deities the use of sacred mushrooms. She also used *Salvia divinorum* fig 88. Mayan mushroom stone with grinding metate (1000 BC). Nine deities receive instructions from Quetzalcoatl on the origin and use of sacred mushrooms Codex Vindobonensis. Mixitec kingdom (Schultes and Hofmann 1979). Second row my roadman Tellus Goodmorning, deer with peyote in its mouth (500 BC Monte Alban), the Nierika, peyote’s portal to the spiritual realm and Don Jose Matsuwa and peyote, containing mescaline. Right and bottom row My curandero Snr. Trinico, chacruna and the vine of the soul, UDV and ayahuasca, containing dimethyl-tryptamine and harmine. While psychedelic “trips” are cyclonic experiences in themselves, that can challenge our conceptions of reality and need careful guidance, at the centre of the cyclone lies the compassionate redemption of a [moksha epiphany](#) that can both provide comfort to the terminally ill, restore faith in life of the depressed and reveal life-changing first-person insight and illumination into the roots of the spiritual quest into the cosmological nature of consciousness. Lower: The principal ingredients of sacred mushrooms, peyote, ayahuasca and salvia.

Sacred Mushrooms The story of the original Quetzalcoatl of the Nahuas who followed the Toltec but predated the Aztec in the valley of Mexico is told in by Dobkin de Rios (1984). They were “quite advanced in their cultural development. Their divinity, Quetzalcoatl was a man of wisdom who gave them a code of ethics and a love for art and science.” Acquaintance with the drug plants goes back to 1000 BC with the Mayan mushroom stones and 300 BC with the Chicameras the Aztec ancestors and the Toltec. Quetzalcoatl is said to have passed knowledge of the mushroom to

Piltzintecuhtli a god of hallucinatory plants, including mushrooms. Quetzalcoatl is the plumed serpent, the feathers signifying flight and divinity and the serpent is his organismic aspect entwined in the natural world. He is symbolic of Venus the “star” that separates the day and the night. The earliest known iconographic depiction of the deity appears on Stela 19 at the Olmec site of La Venta. Dated to around 900 BC, it depicts a serpent rising up behind a person probably engaged in a shamanic ritual.

Because at the time of the arrival of Columbus, these were used by the Aztecs, who were renowned for their sacrificial violence and were documented by conquistadores vehemently and violently opposed to pre-Columbian culture, historical descriptions of their use are shrouded in diabolical accounts. Dobkin de Rios (1984) notes that the divinatory properties of sacred plants [including mushrooms, peyote, datura, morning glory and tobacco] were of paramount importance to the Aztecs. They believed that whoever ate these sacred plants would receive the power of second sight and prophecy. Thus, one could discover the identity of a thief, find stolen objects, or predict the outcome of a war or the attack of a hostile group.

"Sacred mushrooms played such an important part in Aztec life that Indian groups which owed tribute to the Aztec emperor paid it with inebriating mushrooms. One Spanish priest wrote that for the Aztecs, the sacred mushrooms were like the host in the Christian religion: through this bitter nourishment, 'they received their God in communion' The divine mushroom was taken during ritual ceremonies. Successful Aztec merchants sponsored night banquets. The Florentine Codex records that when the participants ate the mushrooms with honey, and they began to take effect, the Aztecs danced, wept, and saw hallucinations. Others entered their houses in a serious manner and sat nodding. Visions included prophecies of one's own death, battle scenes, or war captives that one would take in battle. Others reported visions that they would be rich. All that could possibly happen to a person could be seen under the effects of the mushrooms. After the effect wore off, people would consult among themselves and tell each other about their visions".

Schultes and Hofmann (1979) note that early chroniclers such as Fransisco Hernandez, physician to the King of Spain, described several sacred mushroom species:

'Others when eaten cause madness that on occasion is lasting of which the symptom is a kind of uncontrolled laughter. Usually called teyhuintli, these are deep yellow, acrid of a not displeasing freshness. There are others again, which without inducing laughter bring before the eyes all kind of things such as wars and the likeness of demons. Yet others are not less desired by princes for their fiestas and banquets, of great price. With night-long vigils they are sought, awesome and terrifying.

Friar Sahagun, one of the earliest chroniclers, remarked of the Aztec mushroom eaters:

'when they become excited by them start dancing, singing, weeping. Some do not want to sing but sit down and see themselves dying in a vision; others see themselves being eaten by a wild beast; others imagine they are capturing prisoners of war, that they are rich, that they possess many slaves, that they have committed adultery and were to have their heads crushed for the offence ... and when the drunken state had passed, they talk over amongst themselves the visions they have seen.'

Fig 204: Nine Preclassic mushroom stones found in a cache along with nine miniature metates at the highland Maya archaeological site of Kaminaljuyu. The contents of the cache were dated by Stephan de Borhegyi at 1000-500 BC. The tall jaguar mushroom stone on the left, also from Kaminaljuyu, was excavated separately.

Dobkin de Rios further notes:

"during the coronation feast of Moctezuma in 1502, teonanacatl (the divine mushroom) was used to celebrate the event. War captives were slaughtered in great numbers to honour Moctezuma's accession to the throne. Their flesh was eaten, and a banquet was prepared after the victims' hearts were offered to the gods. After the sacrifice was over, everyone was bathed in human blood. Raw mushrooms were given to the guests, which one writer, Fray Duran, described as causing them to go out of their minds-in a worse state than if they had drunk a great quantity of wine. In his description, these men were so inebriated that many took their own lives. They had visions and revelations about the future, and Duran thought the devil was speaking to them in their madness. When the mushroom ceremony ended, the invited guests left. Moctezuma invited rival rulers to feasts which were held three times a year. One of these important feasts was called the Feast of Revelations, when the invited dignitaries and Moctezuma, or his representative, ate the wild mushrooms. ... During the Aztec king Tizoc's enthronement feast, all those present ate wild mushrooms - the kind that made men lose their senses. After four days of feasting, the newly crowned Tizoc gave his guests rich gifts and sacrificed the Metztlitan victims".

The repression of the sacred mushrooms by the conquistadors resulted in their disappearance from the annals of history, except for the troubling appearance of small mushroom stones dating from 1000 B.C. scattered about the much more ancient ruins of the Mayan civilisation. In 1935 the anthropologist Jean Bassett Johnson witnessed an all night mushroom ceremony at Huautla de Jimenez.

Maria Sabina This report was to lie idle until 1955 when Gordon and Valentina Wasson 'were invited to partake of the *agape of the sacred mushrooms*' in the hills of Oaxaca, among isolated peasant peoples who used them to divine the future and seek a cure of illness, after a long search and a previous unsuccessful season in the town:

"Perhaps you will learn the names of a number of renowned curanderos, and your emissaries will even promise to deliver them to you, but then you wait and wait and they never come. You will brush past them in the market place, and they will know you but you will not know them. The judge in the town hall may be the very man you are seeking and you may pass the time of day with him yet never know that he is your curandero." – Wasson (Weil et. al. 30).

The sacred mushroom is called by the Mazatec Indians '*the little flowers of the gods*' or '*that which springs forth*'. '*The little mushroom comes of itself we know not whence, like the wind that comes we know not whence or why*'.

Wasson was deeply struck by the spiritual power of the sacred mushroom, which he referred to as '*the divine mushroom of immortality*': '*Ecstasy! The mind harks back to the origin of that word. For the Greek ekstasis, meant flight of the soul from the body. Can a better word be found to describe the bemushroomed state? ... Your very soul is seized and shaken until it tingles, until you feel that you will never recover your equilibrium*' (Furst 198). "*... geometric patterns, angular not circular in richest colours, such as night adorn textiles or carpets. Then the patterns grew into architectural structures with colonnades and architraves, patios of regal splendour, the stone work all in brilliant colours, gold and onyx and ebony, all most harmoniously and ingeniously contrived, in richest magnificence extending beyond the reach of sight, in vistas measureless to man ... They seemed to belong... to the imaginary architecture described by the visionaries of the Bible*" (Riedlinger 1996 30).

Shortly before his arrival she had had a vision while on the little saints, that non-Mazatec strangers would come to seek *nti-si-tho*, the little one who springs forth. She had shared her vision with Cayetano García the local sindaco or justice who also partook, he agreed that the knowledge should be shared and brought Wasson to her. Her life was beset by many tragedies including a macabre vision she had shortly afterward on the little things, which foretold the murder of her son, possibly in vengeance for opening the knowledge of the mushroom. Her house and little shop were also burned (Estrada 71, 79). The CIA were also in Mexico in search of the mushroom. Within a few days, a Mexican botanist had phoned the CIA to confirm Wasson's find and an agent was dispatched as a mole on Wasson's return trip.

"The father of my-grandfather Pedro Feliciano, my grandfather Juan Feliciano, my father Santo Feliciano - were all shamans - they ate the teonanacatl, and had great visions of the world where everything is known... the mushroom was in my family as a parent, protector, a friend" — Maria Sabina, who lived to the age of 91.

Maria Sabina took sacred mushrooms in abundance as a child. A few days after watching a wise man cure her uncle :

'Maria Anna and I were taking care of our chickens in the woods so that they wouldn't become the victims of hawks or foxes. We were seated under a tree when suddenly I saw near me within reach of my hand several mushrooms. If I eat you, you and you" I said "I know that you will make me sing beautifully". I remembered my grandparents spoke of these mushrooms with great respect. After eating the mushrooms we felt dizzy as if we were drunk and I began to cry, but this dizziness passed and we became content. Later we felt good. It was a new hope in our life. In the days that followed, when we felt hungry we ate the mushrooms. And not only did we feel our stomachs full, but content in spirit as well. I felt that they spoke to me. After eating them I heard voices. Voices that came from another world. It was like the voice of a father who gives advice. Tears rolled down our cheeks abundantly as if we were crying for the poverty in which we lived.' She had a vision of her dead father coming to her. '*I felt as if everything that surrounded me was god.*

Maria Anna and I continued to eat the mushrooms. We ate lots many times, I don't remember how many. Sometimes grandfather and at other times my mother came to the woods and would gather us up from the ground on which we were sprawled or kneeling. "What have you done?" they asked. They picked us up bodily and carried us home. In their arms we continued laughing singing or crying. They never scolded us nor hit us for eating mushrooms. Because they knew it isn't good to scold a person who has eaten the little things, because it causes contrary emotions and it is possible that one might feel one was going crazy' (Estrada 39).

After the death of her first husband Maria Sabina performed a *velada* for Maria Anna, who was sick with an internal bleeding. After expressing the blood she had a vision of six or eight people who inspired her with respect - 'the Principal Ones of whom my ancestors spoke'. One of the Principal ones spoke to her and showed her the book of wisdom. She realised that she was reading her book. Afterwards she had the contents always in her memory, and became herself one of the Principal Ones who became her dear friends. After this vision, she had another vision of Chicon Nindo the lord of the mountains, a being surrounded by a halo, whose face was like a shadow. She realised that she had become his neighbour. She entered the house and had another vision of a vegetal being covered with leaves and stalks that fell from the sky with a great roar like a lightning bolt. *"I realized that I was crying and that my tears were crystals that tinkled when they fell on the ground. I went on crying but I whistled and clapped, sounded and danced. I danced because I knew I was the great Clown woman and the Lord clown woman"* (Estrada 49).

*"Says.. woman who thunders am I,
woman who sounds am I.
Spiderwoman am I, says
hummingbird woman am I says
Eagle woman am I, says
important eagle woman am I.
Whirling woman of the whirlwind am I, says
woman of a sacred, enchanted place am I, says
Woman of the shooting stars am I." ...*

(Mushroom Ceremony - Smithsonian Institute)

*I'm a birth woman, says
I'm a victorious woman, says
I'm a law woman, says
I'm a thought woman, says
I'm a life woman, says ...
"I am a spirit woman, says
I am a crying woman, says
I am Jesus Christ, says ...
I'm the heart of the virgin Mary."*

Maria Sabina notes (Schultes and Hofmann 1979):

'There is a world beyond ours, a world that is far away, nearby and invisible. And there is where God lives, where the dead live, the spirits and the saints, a world where everything has already happened and everything is known. That world talks. It has a language of its own. I report what it says. The sacred mushroom takes me by the hand and brings me to the world where everything is known. It is they, the sacred mushrooms that speak in a way I can understand. I ask them and they answer me. When I return from the trip that I have taken with them I tell what they have told me and what they have shown me'. 'The more you go inside the world of teonanacatl, the more things are seen. And you also see our past and our future, which are there together as a single thing already achieved, already happened. . . . I saw stolen horses and buried cities, the existence of which was unknown, and they are going to be brought to light. Millions of things I saw and knew. I knew and saw God: an immense clock that ticks, the spheres that go slowly around, and inside the stars, the earth, the entire universe, the day and the night, the cry and the smile, the happiness and the pain. He who knows to the end the secret of teonanacatl – can even see that infinite clockwork'.

Traditionally the mushroom was taken not merely to see god, but to cure physical maladies (see [section 2](#)). The healing process could be severe and terrifying. At a *velada*⁵⁹ attended by Wasson, a young boy took the mushrooms to seek a cure. However Schultes and Hofmann comment:

"upon learning from Maria that the mushrooms prognosticate death, the boy falls to the ground in despair. He did in fact die a few days later of undiagnosed, but apparently natural causes". Maria Sabina described this somewhat differently: "But there was no remedy for the sick one. His death was near. After I saw Perfecto's appearance, I said to Aurelio 'This child is in a very grave condition'. ... I took the children and began to work. That was how I learned that Perfecto had a frightened spirit. His spirit had been caught by a malevolent being. ... Weeks went by and someone informed me that Perfecto had died. They didn't take care of him like they should have. If they had done several vigils he would certainly have gotten well" (Estrada 72).

Fray Bernadino de Sahagun estimated from Indian chronology that peyote had been known to the Chichimeca and Toltec at least 1890 years before the arrival of the Europeans. Usage for as long as 3000 years is suggested from Tarahumara rock carvings and Peyote specimens found in Texas rock shelters. de Sahagan reports: *"There is another herb like [opuntia]. It is called peiotl. It is found in the north country. Those who eat or drink it see visions, either frightful or laughable. This intoxication lasts two or three days and then ceases. It is a common food of the Chichimeca, for it sustains them and gives them courage to fight and not to feel hunger or thirst. And they say it protects them from all danger"* (Schultes and Hofmann 132).

Peyote The Huichol as discussed in the [animism chapter](#) (see also [section 2](#)) make a yearly pilgrimage, the peyote hunt, over 600km of rugged desert country. They refer to a portal to the spirit world, the nierika (fig 203) which can be negotiated by the devoted practitioner during the trance-like peyote experience:

⁵⁹ *velada* soirée, nighttime meeting, literally a shamanic mushroom vigil Spanish *velar* Latin *vigilō* ("to watch, guard") as in vigilant.

There is a doorway within our minds that usually remains hidden and secret until the time of death. The Huichol word for it is nierika – a cosmic portway or interface between so-called ordinary and non-ordinary realities. It is a passageway and at the same time a barrier between the worlds” (Halifax 242).

Fig 205: Two Chavin urns with jaguar beside mescaline containing San Pedro cacti (1200-600 BC), Aztec mural showing sacred mushroom deity (Magliabecchiano Codex) as an apotheosis of a mushroom taker, a Chavin statue showing snuffing nasal discharge, Amazonian Yanomamo using a hallucinogenic snuffing pipe for Anadenanthera beans containing bufotenine, Nazca gourds showing nasal discharge from hallucinogenic snuffing, and a Nazca pottery (100-800 AD) showing San Pedro use.

One of the most outstanding Huichol peyote

shamans of modern times is don Jose Matsuwa (fig 203), who at 1990 was the venerable age of 109. Besides walking in the sacred journey to Wirikuta, 'don Jose spent many years living alone in the Huichol sierra learning directly from the ancient ones who reside there in the caves and mountains. In order to become a shaman in the Huichol tradition one must learn to dream consciously and lucidly, for after a healing has been performed, that night the shaman tries to dream about the patient and find out the reason for the illness. Each day the Huichols tell their dreams to "Grandfather fire". Dreams help to bring together the past, present and the future' (Halifax 249).

"The shaman's path is unending. I am an old, old man and still a nunutsi (baby) standing before the mystery of the world"

"I have pursued my apprenticeship for sixty-four years. During these years, many, many times I have gone into the mountains alone. Yes I have endured much suffering in my life. Yet to learn to see, to learn to hear, you must do this - go into the wilderness alone. For it is not I who can teach you the ways of the gods. Such things are learned only in solitude." - Don Jose Matsuwa (Halifax) 238).

Brant Secunda became his apprentice after walking from Ixtlan into the mountains:

'On the third day of my journey, I became completely lost after walking down a deer trail. I became terrified and lay down to die, from sun exposure and dehydration. I then began to have vivid visions of colourful circles filled with deer and birds, but was suddenly awakened by Indians standing over me sprinkling water over me. They told me the shaman of their village had had a dream about me two days earlier and they had been sent out to rescue me' (Rainbow Network Aug 90 4).

"When the mara'akame passes through the nierika he moves just as the smoke moves; hidden currents carry him up and in all directions at once ... as if upon waves, flowing into and through other waves ... the urucate. As the mara'akame descends and passes through the nierika on the return, his memory of the urucate and their world fades; only a glimmer remains of the fantastic journey that he has made" (Halifax 242).

Psychedelic use also goes back centuries in South America. One of the most powerful traditions in shamanic use of sacred plants comes from a complex of plants containing various admixtures of methylated-tryptamines and beta-carbolines used as snuffs and hallucinogenic potions in the Amazon basin. San Pedro use, which like peyote contains mescaline, is evident in the cactus found alongside a leopard in a vase in Chavin culture (1200-600 BC) and San Pedro and sculptures showing snuff use among Nazca (100-800 CE).

Ayahuasca is a potent psychedelic admixture based on both dimethyl-tryptamine (DMT) and harmine. The bark of the vine of certain Banisteriopsis species is mashed and boiled with the leaves of plants such as certain Psychotria species. Sometimes some tropanes are also added. The principle is regarded as a major botanical discovery: the harmine acts as a mono-amine oxidase inhibitor, making it possible for the DMT to both enter the body through the stomach and to remain in action for some four hours. In combination, these substances produce a profound and sustained visionary state of a particularly tumultuous kind.

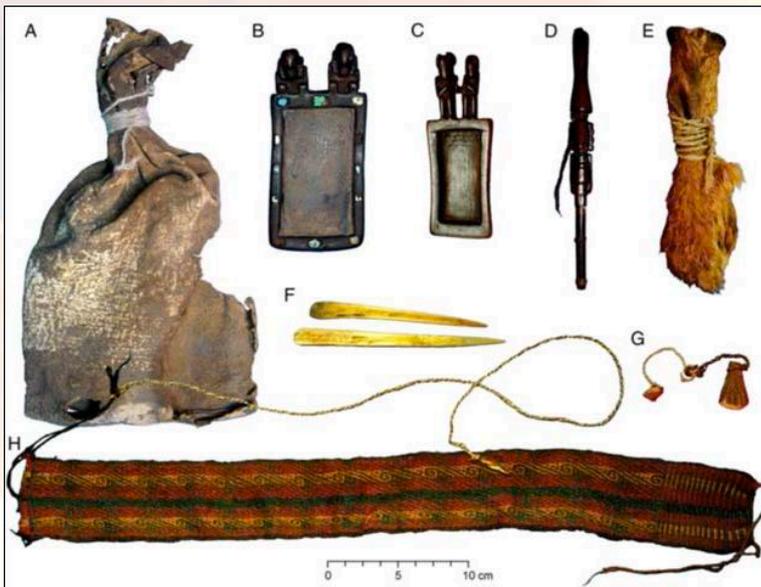

Fig 206: Diverse sacramental use of psychedelic entheogens over millennia in the Americas. Cueva del Chileno ritual bundle, LÍpez highlands of southwestern Bolivia radio-carbon dated to approximately 1,000 C.E. consisting of: outer leather bag (A), expertly carved and decorated wooden snuffing tablets with anthropomorphic figurines (B and C), intricate anthropomorphic snuffing tube with two human hair braids attached to it (D), animal-skin pouch constructed of three fox snouts (*L. culpaeus*) stitched together (E), two camelid (*L. glama*) bone spatulas (F), two small pieces of dried plant material attached to wool and fibre strings (G), and a polychrome woven textile headband (H). Artifacts (E and G) were tested using LC-MS/MS analysis. LC-MS/MS results from the fox-snout pouch indicate the presence of cocaine, BZE, harmine, bufotenine, DMT, and peak potentially corresponding to psilocin (Miller et al. 2019).

Michael Harner (1980) gives a striking description of his introduction to ayahuasca by the Conibo indians:

'Just a few minutes earlier I had been disappointed, sure that the ayahuasca was not going to have any effect on me. Now the sound of rushing water flooded my brain. My jaw began to feel numb ... Overhead the faint lines became brighter and gradually interlaced to form a canopy resembling a geometric mosaic of stained glass. I could see dim figures engaged in shadowy movements ... the moving scene resolved itself into a supernatural carnival of demons. In the centre was a gigantic grinning crocodilian head from whose cavernous jaws gushed a torrential flood of water'. The scene gradually transformed into sky and sea. He then saw two vessels which merged 'into a single vessel with a dragon-headed prow'. 'I heard a regular swishing sound and saw it was a giant galley. I became conscious too of the most beautiful singing I have ever heard in my life ... emanating from myriad voices on the galley. I could make out large numbers of people with the heads of blue jays'. 'At the same time some energy essence began to float from my chest up into the boat' as if to take his soul away.

Fig 207: Ayahuasca serves to form a meaningful social bond reinforcing the inner meaning of cultural values of the tribal relationships. It is thus valuable for young people and serves as a protection from the scourges of cocaine addiction. Note the death-like visage on the left (Psychedelic Science TV). Left & Right: Phosphene ornamentation on the Maloca Ritual yaje vessel (female) (Reichel-Dolmatoff 1978).

His body began to become numb as if his heart was going to stop. His brain became partitioned into an intellectual command level, the numb level and lower levels of the visions'.

'I was told that this new material was being presented to me because I was dying and therefore 'safe' to receive these revelations. First they showed me the planet earth as it was eons ago. Then appeared large creatures with pterodactyl-like wings which were fleeing from something out in space and showed me how they had created life on the planet in order to hide within the multitudinous forms. He then witnessed the unfolding of plant and animal speciation learning that the dragon-like creatures were inside all forms of life. These revelations alternated with visions of the floating galley which had almost taken my soul on board. With an unimaginable last effort, I barely managed to utter one word: "Medicine!" I saw them rushing around to make an antidote which eased my condition but did not prevent me from having many additional visions. Finally I slept. Rays of light were piercing the holes in the palm-thatched roof when I awoke. I was surprised to discover that I felt refreshed and peaceful' (Harner 1980).

In South America, there are two widespread movements supporting the spiritual and therapeutic use of ayahuasca which have also initiated world-wide interest (see [section 2](#)), the Union Vegetale and Santo Daime, a syncretic movement combining Catholicism with indigenous beliefs centred on the use of ayahuasca for personal spiritual and religious insight. *"Within traditional religious settings, often individuals are required to accept what the religious authorities tell them to accept. In new religious forms, in new spiritualities, such as Santo Daime, the individual is absolutely central to forming the religious beliefs that the individual holds."* (Dr Andrew Dawson)

I have travelled personally to the sources of the natural psychedelics, having been twice to the Amazon to take ayahuasca, having taken peyote, both with the Native American Church and on Wirikuta, the sacred mountain of the Huichol. I have spent much of my life in a psychic symbiosis with sacred plants and fungi, particularly sacred mushrooms and in the scientific discovery of *Psilocybe aucklandii*.

Michael Pollen, in “How to Change Your Mind” (2018) has given an insightful current account of the state of psychedelic research and therapy, including several personal accounts of taking sacred mushrooms, ayahuasca, LSD and bufotenine, which give indicative first-time experiences of a novice under these agents.

Incarnate Existence

Complementarity is a Tao.
Reality is a Tantra.

As body is to mind,
as nature is to experience,
as universe is to consciousness
so particle is to wave,
fermion is to boson,
matter is to light,
sperm is to egg,
male is to female,
time is to space,
past is to futures,
consistency is to paradox,
order is to chaos,
defection is to cooperation.

A prisoners' dilemma
in the bundle of life,
which can be known
and unravelled
only by being.

Natty Dread and Planetary Redemption ⁶⁰

Christianity's Apocalyptic Tragedy and the Immortal Tree of Life

For Elaine Pagels, in memory of Vibia Perpetua

1. The Scope of the Crisis

Christianity presents a unique threat to world futures by the misleading portrayal of Jesus as a miraculous supernatural "Son of God", in conflict both with any credible cosmological account of existence and not least with the core principles of Monotheism. The other monotheistic religions also have a scorched-Earth eschatology ⁶¹, amid violence, particularly to women (Schwartz 1996), in conflict with our primary cosmological responsibility as a sexual species to ensure the diversity of conscious life survives. The Christian canonical account undermines the capacity of humankind to fathom what kind of universe, or existential cosmos we are actually living in and threatens humanity's ability to survive and flourish in evolutionary time scales without lethal misadventure. It is a cargo cult illusion threatening ours and the living planet's living future, through a direct conflict of belief with reality, promoted by miraculous fallacy.

Fig 209: Akkadian "Temptation seal": The man, the woman, the tree of life and the serpent (2200 BCE).

When the priestly author wrote Genesis 1, claiming the 'Elohim said "*Let there be light and there was Light*", creating heaven and Earth out of *tohu va vohu*, casting the plants as created before the Sun and Moon, and making humanity male and female in "our" likeness, we know that black holes and galaxies had

been forming long before, and that neutrinos were flashing through the Earth unnoticed. We now know that all people alive and present at the time, were composed of quarks and leptons grouped in baryons, nuclei, atoms, molecules, organelles, cells and organs, with DNA, RNA and proteins coursing through their veins and permeating their tissues. That they/we were not created from clay or breath, but develop naturally from the fertilisation of egg and sperm. This is not materialism speaking, it is cosmology. Genesis is not the oldest book in the Torah, but is a more recent addition.

And God said, Let the earth bring forth grass, the herb yielding seed, and the fruit tree yielding fruit after his kind, whose seed is in itself, upon the earth: and it was so. ... And the evening and the morning were the third day.

And God made two great lights; the greater light to rule the day, and the lesser light to rule the night: he made the stars also. ... And the evening and the morning were the fourth day.

⁶⁰ This article and the complementary one "Natural Entheogens and Cosmological Symbiosis: Solving the Central Enigma of Existential Cosmology" were co-conceived out of a quantum change experience. Taken together they inform a sacramental paradigm shift towards planetary survival.

⁶¹ *eschatology* the part of theology concerned with death, judgement, and the final destiny of the soul and of humankind. Greek *eskhatos* 'last' + -logy.

And God blessed them, and God said unto them, Be fruitful, and multiply, and replenish the earth, and subdue it: and have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth.

The word subdue is the Hebrew verb *kavash* meaning to place your foot on the neck of your conquered enemy signifying a submission of the enemy to his defeater. The words "have dominion" (from Latin *dominium*, from *dominus* 'lord, master') are the Hebrew verb *radah* meaning to rule by going down and walking among the subjects as a benevolent leader.

We can accept the priestly Sabbatical Creation as a beautiful allegory based on the understanding available at the time, even though the Yahwistic account in the Garden of Eden is a punitive curse on humanity as sexual beings, casting womankind in the role of the "devil's gateway" enduring the pain of childbirth under the rule of her husband and depriving humanity of immortal Paradise, to battle the thistles and thorns in human conflict with nature.

We know from Jeremiah's claims of God's anger and the resulting response of the people, that the religious practices of Jerusalem in the time of the Kings involved diverse forms of worship, including the Goddess by her various names – Inanna/Ishtar, or Asherah the ancient consort of El, and the male god Tammuz/Dumuzi, who, was contemporaneously spurned by Gilgamesh for her excesses (Mark 2011). But we also at once know the people at the time were using *Saccharomyces cerevisiae*, a eucaryote yeast, to make their bread and wine, which a couple of billion years before had arisen from a pivotal symbiosis between an Asgard archaean and a proteobacterium, as we all have. Again this is not materialism, but nature speaking.

Jer 7:17 "Seest thou not what they do in the cities of Judah and in the streets of Jerusalem? The children gather wood, and the fathers kindle the fire, and the women knead their dough, to make cakes to the queen of heaven, and to pour out drink offerings unto other gods, that they may provoke me to anger"

Jer 44:17 "But we will certainly do whatsoever thing goeth forth out of our own mouth, to burn incense unto the queen of heaven, and to pour out drink offerings unto her, as we have done, we, and our fathers, our kings, and our princes, in the cities of Judah, and in the streets of Jerusalem: for then had we plenty of victuals, and were well, and saw no evil. But since we left off to burn incense to the queen of heaven, and to pour out drink offerings unto her, we have wanted all things, and have been consumed by the sword and by the famine."

Psalm 82's confession of polytheism likewise shows this diversity:

"God standeth in the congregation of the mighty; he judgeth among the gods ... I have said, Ye are gods; and all of you are children of the most High ... But ye shall die like men, and fall like one of the princes."

History in both the Old and New Testaments is perceived through a glass darkly, in Paul's own words, distorted by the political bias and religious imperatives of the redactors. The diversity of worship described in Jeremiah in the time of the Kings comes to us through the Yahwistic gloss of the exilic authors in Babylon, sharpened by Zoroastrian apocalyptic ideas, replacing the Hebrew notion of Sheol with a future purification by fire in the end of days, leading to the stark contrast of Heaven and Hell. This originated from the time Cyrus allowed the Jews in exile to return to Israel, where they instituted a more fundamentalistic paradigm, ordering the men of Israel to forsake their gentile wives:

"And Shechaniah ... answered and said unto Ezra, We have trespassed against our God, and have taken strange wives of the people of the land: yet now there is hope in Israel concerning this thing. Now therefore let us make a covenant with our God to put away all the wives, and such as are born of them, according to the counsel of my lord, and of those that tremble at the commandment of our God; and let it be done according to the law" (Ezra 10:2).

Life in Israel up to this point had been culturally diverse. Free worship in the tabernacles from ancient times had been supplanted only a few years before the Babylonian annexation, by Jerusalem-centred worship, by the youthful Josiah. As Wikipedia puts it: "Between the 10th century BCE and the beginning of their exile in 586 BCE, polytheism was normal throughout Israel. It was only after the exile that worship of Yahweh alone became established, and possibly only as late as the time of the Maccabees (2nd century BCE) that monotheism became universal among the Jews".

Likewise, we know Christian history is a distorted tale, firstly of the supplanting of the original following of Yeshua by born again Pauline revisionism under threat of the *anathema maranatha* despite Paul having no direct knowledge of the events, or the key character involved, and then by the orthodox victors who suppressed the Valentinian gnostics and many others, causing the Nag Hammadi texts to be buried in jars until the 20th century, just as later developments like the Nicene creed and the Trinity also constitute confabulations of Yeshua's mission.

2. A Cross-Cultural Perspective

To be fully understood, Yeshua's apocalyptic journey of redemption thus has to be seen in its context. Israel was in a state of flux, effectively ruled by the Romans, with the Sanhedrin Sadducees and the tetrarchs holding high office, Pharisees spread through the smaller towns and more extreme sects such as the Essenes in desert retreats. By contrast, the Edomite Kingdom of Nabatea which emerged around 300 BCE, was in its cultural prime and was an autonomous state, reaping rich commercial gains as the artery through which trade coursed from the East to and from Europe via Gaza. Edom was a nominally Arab culture whose original female deities, al-Lat, al-Uzza and Manat who continued to be worshipped in Mecca up to the time of Muhammad, along with Dhushara the Lord of Seir. Gen 32:3 *"And Jacob sent messengers before him to Esau his brother unto the land of Seir, the country of Edom"*.

In the wake of Alexander cutting a military swathe across the Near East and the ensuing Seleucid empire, these deities were imbued with Greek personae as can be seen in the architectural forms of Nabatean deities, where the female deities took on Greek forms like Tyche and Dhushara became a Dionysian deity whose tragic mask had the power to confer immortal life.

Israel, Nabatea and surrounding lands all spoke the Aramaic language of Syria. This was the language of Yeshua in Galilee and this was the language of the Nabateans. Galilean Aramaic is noted in Peter's exposure: *"And a little after, they that stood by said again to Peter, Surely thou art one of them: for thou art a Galilaean, and thy speech agreeth thereto."* (Mark 14:11) Deuteronomy notes of Jacob *"A wandering Aramaean was my father"*. The word Aram goes right back to the Mari texts of the twelfth century BCE. The whole area around Israel was in a state of inter-communication through commerce and a common language. The rulers of Nabatea and the Herodian dynasty closely intermarried. There was a Jewish population scattered throughout and on all sides diverse beliefs. Nabatea held its own celebrations and religious festivals *"on every high hill and under every green tree"* as the Jewish curse against the nations goes.

Yeshua's mission was invoked when John the Baptist cursed Herodias, accusing Herod Antipas of taking the wife of his brother Herod II (Philip) in contradiction to Hebrew law. Lev 18:16 *"Thou shalt not uncover the nakedness of thy brother's wife: it is thy brother's nakedness."* Josephus and Mark both recount aspects of this event. Herod asked Salome the daughter of Herodias to dance (the seven-veils descent ⁶²) in front of his generals at Macherus on the Nabatean border to their pleasure:

*And when a convenient day was come, that Herod on his birthday made a supper to his lords, high captains, and chief estates of Galilee; And when the daughter of the said Herodias came in, and danced, and pleased Herod and them that sat with him, the king said unto the damsel, Ask of me whatsoever thou wilt, and I will give it thee. And he sware unto her, **Whatsoever thou shalt ask of me, I will give it thee, unto the half of my kingdom.** And she went forth, and said unto her mother, What shall I ask? And she said, The head of John the Baptist. And she came in straightway with haste unto the king, and asked, saying, I will that thou give me by and by in a charger the head of John the Baptist (Mark 6:21-25).*

But this was no ordinary occasion and it's about a lot more than the morality of divorce and was in fact exposing a mortal threat to Herod. It is likely that Herod's high captains were present because Herod had sent his previous wife the Nabatean princess royal Phasaelis, daughter of Aretas IV, fleeing in fear of her life. Josephus notes:

About this time Aretas, the king of the Arabian city Petra, and Herod Antipas had a quarrel. Herod the tetrarch had married the daughter of Aretas [called Phasaelis], and had lived with her a great while. But when he was once at Rome, he lodged with Herod [Philip], who was his brother indeed, but not by the same mother (this Herod was the son of the high priest Simon's daughter). Here, he fell in love with Herodias, this other Herod's wife, who was the daughter of Aristobulus their brother, and the sister of Agrippa the Great. Antipas ventured to talk to her about a marriage between them; when she admitted, an agreement was made for her to change her habitation, and come to him as soon as he should return from Rome: one article of this marriage also was that he should divorce Aretas' daughter. So Antipas made this agreement and returned home again. But his wife had discovered the agreement he had made before he had been able to tell her about it. She asked him to send her to Machaerus, which is a place in the borders of the dominions of Aretas and Herod, without informing him of her intentions. So, Herod sent her thither, unaware that his wife had perceived something. Earlier, she had sent to Machaerus, and all things necessary for her journey were made already prepared for her by a general of Aretas' army. Consequently, she soon arrived in Arabia, under the conduct of several generals, who carried her from one to another successively. She met her father, and told him of Herod's intentions. So Aretas made this the first occasion of the

⁶² Inanna the Queen of Heaven's descent into Hell, stripped one by one of her seven veils, by the Galla of her sister Ereshkigal's domain of Hell, before returning to let them sacrifice her beloved husband and partner Dumuzi for usurping the sovereign's powers in her absence, only to have him resurrected and sacrificed seasonally as a God of fertility.

enmity between him and Herod, who had also some quarrel with him about their limits near Gamala. So both sides raised armies, prepared for war, and sent their generals to fight.

Aretas, who figures as joint ruler with Queen Shaliqat on coinage, then invaded and defeated Herod with the military help of Herod's other brother Philip, attesting to the cooperation between the Herodian and Nabatean dynasties. The name Phasaelis was also the name of Phasael, Herod the Great's brother, himself born in the Hasmonean Kingdom to a Jewish aristocratic family of Edomite descent. What this goes to show is how interpenetrating the affairs of Israel and Nabatea actually were, despite their contrasting religious traditions and how Yeshua came to replace John when he was effectively sacrificed in the Inanna's descent (Wolkenstein & Kramer 1987).

Note that, according to Mark's account, Herod swore unto Salome "Whatsoever thou shalt ask of me, I will give it thee, unto the half of my kingdom," echoing the sacrificial ending of the Book of Esther ⁶³. In return, completing Inanna-Ishtar's descent, Herodias, through Salome's dance, demanded John's head on a plate, completing the sacrificial descent of Dumuzi-Tammuz.

Fig 210: (Left) Aretas IV and Queen Shaliqat jointly on the Nabatean coinage. (Right) Aubrey Beardsley for Oscar Wilde's "Salome".

Josephus again notes: *When they joined battle, Herod's army was completely destroyed by the treachery of some fugitives, who, though they were from the tetrarchy of Philip, had joined Aretas' army. So Herod wrote about these affairs to the emperor Tiberius, who became very angry at the attempt made by Aretas, and wrote to Lucius Vitellius, the governor of Syria, to make war upon him, and either to take him alive and bring him to him in bonds, or to kill him and send him his head. This was the charge that Tiberius gave to the governor of Syria.*

However Tiberius then died and the order against Aretas was never carried out.

The apocalyptic mission is thus portrayed in the Christian gospels as having passed through sacrifice to John's baptised successor Yeshua. Luke 7:19 "And John calling unto him two of his disciples sent them to Jesus, saying, Art thou he that should come? or look we for another?" Mark 6:16 "But when Herod heard thereof, he said, It is John, whom I beheaded: he is risen from the dead". John makes this even more explicit: 3:28 "Ye yourselves bear me witness, that I said, I am not the Christ, but that I am sent before him. He that hath the bride is the bridegroom: but the friend of the

⁶³ Esther (Ishtar), the beautiful Jewish wife of the Persian king Ahasuerus (Xerxes I), and her cousin Mordecai (Marduk), persuade the king to retract an order for the general annihilation of Jews throughout the empire. The massacre had been plotted by the king's chief minister, Haman, and the date decided by casting lots (purim). Instead, Haman was hanged on the gallows he built for Mordecai. When word of the planned massacre reached Esther, beloved Jewish queen of Ahasuerus and adopted daughter of Mordecai, risked her life by going uninvited to the king to suggest a banquet that Haman would attend. — *Now it came to pass on the third day, that Esther put on her royal apparel, and stood in the inner court of the king's house, over against the king's house: and the king sat upon his royal throne in the royal house, over against the gate of the house. And it was so, when the king saw Esther the queen standing in the court, that she obtained favour in his sight: and the king held out to Esther the golden sceptre that was in his hand. So Esther drew near, and touched the top of the sceptre. Then said the king unto her, What wilt thou, queen Esther? and what is thy request? it shall be even given thee to the half of the kingdom. And the king said unto Esther at the banquet of wine, **What is thy petition? and it shall be granted thee: and what is thy request? even to the half of the kingdom it shall be performed.** Then answered Esther, and said, My petition and my request is; If I have found favour in the sight of the king, and if it please the king to grant my petition, and to perform my request, let the king and Haman come to the banquet that I shall prepare for them, and I will do to morrow as the king hath said. Then Esther the queen answered and said, If I have found favour in thy sight, O king, and if it please the king, let my life be given me at my petition, and my people at my request: For we are sold, I and my people, to be destroyed, to be slain, and to perish. Then the king Ahasuerus answered and said unto Esther the queen, Who is he, and where is he, that durst presume in his heart to do so? And Esther said, The adversary and enemy is this wicked Haman. Then Haman was afraid before the king and the queen. And the king arising from the banquet of wine in his wrath went into the palace garden: and Haman stood up to make request for his life to Esther the queen; for he saw that there was evil determined against him by the king. Then the king returned out of the palace garden into the place of the banquet of wine; and Haman was fallen upon the bed whereon Esther was. Then said the king, Will he force the queen also before me in the house? As the word went out of king's mouth, they covered Haman's face. And Harbonah, one of the chamberlains, said before the king, Behold also, the gallows fifty cubits high, which Haman had made for Mordecai, who spoken good for the king, standeth in the house of Haman. Then the king said, Hang him thereon. So they hanged Haman on the gallows that he had prepared for Mordecai.*

bridegroom, which standeth and heareth him, rejoiceth greatly because of the bridegroom's voice: this my joy therefore is fulfilled”.

However it remains historically unclear whether the Baptist intended this succession, as he was beheaded.

Luke has John state emphatically the Yeshua is the Christ “And as the people were in expectation, and all men mused in their hearts of John, whether he were the Christ, or not; John answered, saying unto them all, I indeed baptize you with water; but one mightier than I cometh, the latchet of whose shoes I am not worthy to unloose: he shall baptize you with the Holy Ghost and with fire: Whose fan is in his hand, and he will thoroughly purge his floor, and will gather the wheat into his garner; but the chaff he will burn with fire unquenchable.” But the winnowing fan is characteristic of Tammuz and Dionysus the dying gods of bread and wine who are combined in the two substances of the eucharist.

To understand his mission and how Yeshua envisaged it, we have to turn to sources of material documented long after the events, by followers with divergent eschatologies. None of these authors had direct experience of Yeshua’s presence or were present during his mission, so all accounts are hearsay and thus non-evidential. Despite Yeshua’s miracles forming a key part of his ministry in the gospels, modern biblical scholars are almost universal in their scepticism of these accounts, although they form the central contradiction of Christian beliefs.

One way of understanding these hearsay scriptural accounts is to combine (a) the three synoptic gospels, beginning from Mark (c 66-74 CE), with earlier dates largely discredited. It is complemented by the proposed Quelle sayings source, assigning John and Revelation to be later (90-100 CE), historically less reliable and in conflict with the synoptics, with (b) the Gospel of Thomas (c 60-120 CE), forming a counterpoint, underpinned by material from other Nag Hammadi texts, (c) the relevant Talmud entries and (d) the works of Flavius Josephus, excepting the Christian redactions concerning Yeshua (Wilson I 1996) Matthew and Luke/Acts are roughly contemporaneous and around half a century after Yeshua’s death and well after the siege of Jerusalem. Most scholars believe Matthew was composed between AD 80 and 90. The most probable date for Luke’s composition, along with Acts is around AD 80–110. Revelation is commonly dated to about 95 AD. The fact that Acts is deeply embedded in the Pauline ‘heresy’ to convert Yeshua’s mission to a new gentile religion, their accounts of Yeshua have to be seen as highly coloured and thus of similar questionability to the Gnostic texts, with the exception of the Gospel of Thomas, which is a collection of source sayings, and particularly in terms of their retrospective apocalyptic emphasis in the light of the Fall of Jerusalem.

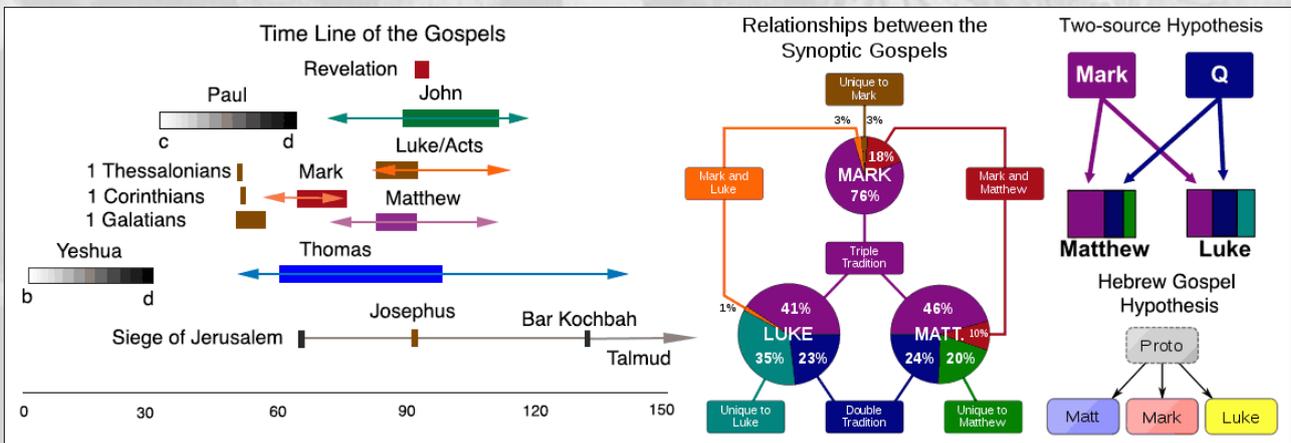

Fig 211: Time line of the gospels. The Pauline epistles are at least 20 years after Yeshua’s crucifixion, but before the Fall of Jerusalem. The four canonical gospels and Revelation are all after the Fall, consistent with their apocalyptic stance. The three synoptics have both commonalities and differences. Matthew and Luke are believed to have derived from Mark and the Q (*quelle* = other) source. The hypothesis of a Hebrew rather than Greek origin, deriving from Papias of Hierapolis, 125–150 CE ⁶⁴ has been largely discredited. This time line raises major uncertainties about the origin of Christianity and how much of what is in the synoptic gospels is Yeshua’s own world view rather than that of Pauline Christianity. Paul began his epistles in AD 49-50 17 years after Yeshua’s death and Mark was written close to 70 AD, another 20 years later. The key question to ask is how much of the Hellenistic world view and events in the synoptics, which are essential to establishing the dying saviour role of Son of God did Yeshua conceive?

The dating of the Gospel of Thomas remains controversial. Broadly speaking, the early camp includes scholars of gnosticism such as Elaine Pagels (2003), Marvin Meyer (2005,7) and April DeConick (2006,7), while the late camp tends

⁶⁴ “Matthew collected the *logia* in the Hebrew dialect and each one interpreted them as best he could.”

to include ordained priests such as John P. Meier and Joshua R. Porter, and professed evangelicals such as Bart D. Ehrman and Craig A. Evans. This highlights the political rather than historical basis of the late camp position.

Evidence for an early origin comes from a number of known parables, including Thomas 8, 9, 31, 57, 63, 64 and 65 where the Thomas version underlies the canonical versions. Thomas 17 modifies Paul's statement in 1 Corinthians 2:9 (53–54 CE), echoing Isaiah 64:4. The episode in John about the doubting Thomas, with the former attempting to discredit the latter, in the passage about Thomas not fully recognising Yeshua's divinity, disclaims Thomas-13's gnostic view in favour of his own, implying Thomas was in existence when John was compiled. In the same vein Thomas 13, criticising both Peter and Matthew's views of Yeshua, hints at an early stage, when the gospel writers were all vying in their points of view, before the authority of the canonical writers had become established. In Thomas 12, Yeshua refers to James the Just, consistent with Galatians 2:1-14, which most scholars date to 50-60 CE. Sayings 6, 14 and 104 also echo opposition to Jewish traditions, regarding circumcision and fasting against consistent with Galatians. Although the gospel of Thomas states "*These are the secret sayings which the living Jesus spoke and which Didymos Judas Thomas wrote down*" where *didymos* means "twin" the Thomas sayings 55, 99 and 101 express clear opposition to a family tradition of the desposyni, in contrast with later gnostic texts where the family tradition is emphasised in Thomas being Yeshua's twin brother. Likewise the reference to James in Thomas 12 does not specify that James is the brother.

The late camp tend to interpret the sayings as mid-second century conflation of canonical gospel statements combined with some additional inauthentic or authentic older sayings. For example Thomas 5 "*Recognize what is in your sight, and that which is hidden from you will become plain to you. For there is nothing hidden which will not become manifest.*" is claimed to echo Luke 8:17, and 10 "*I have cast fire upon the world, and see, I am guarding it until it blazes.*" is claimed to echo Luke 12:49. This reading seems incorrect as the two slants have opposing implications and the Thomas passage is more consistent in its conception. Thomas 16, in which dissension is cast upon the earth is claimed to conflate Luke 12:51-2 and Matt 10:34-5. The difficulty here is that these Thomas sayings could be from an older text. Both these passages are assigned to be from Q. This claim is compounded by the claim that in the Oxyrhynchus Greek passages, 5 uses the language of Luke rather than Mark, but arguing from one passage believed to have been written down around 200 CE, this is not conclusive, especially given the lack of agreement about the original language in which Thomas was written (Coptic, Greek or Syriac). Other arguments centre around the supposed similarity to Syriac compilations of the canonical gospels and the lack of apocalyptic content in Thomas in favour of gnostic realisation that the kingdom is in the mind, but the former is contested and the latter is self-fulfilling orthodox rationalisation, because Thomas's view clearly differs from orthodox beliefs in the apocalyptic destiny of Christianity.

Elaine Pagels (2012) also notes the antagonism between John and Paul expressed by each in the Epistles and the Euangélion, with John adhering to more orthodox practices on food and sex and Paul becoming the catalyst for a new religion, usurping and violating Jewish practices.

The Nag Hammadi texts, although diverse and apocryphal accounts, most of which are historically much later, can be given some comparable weighting to the Pauline works, as both are derived by followers who did not actually meet Yeshua and were not present during his mission. This is the only unbiased way to give an investigative balance to the question of Yeshua's actual mission, as opposed to the Christian religious canon, on the basis that checking both sides, of the story, orthodox and gnostic, helps uncover the inconsistencies between them. This approach is again not materialistic, because the gnostic wing of the scripture is both the most spiritually diverse and fantastic and offsets the Pauline works as equally the product of an imaginative rewriting of Yeshua's mission in the eyes of the beholder.

It is clear that, whatever his strengths or weaknesses, Yeshua was a brilliant transformative innovator, with an unparalleled insight into the spiritual zeitgeist, a literal Einstein of the existential crisis of his time, who embraced the true meaning of apocalypse, to throw the covers of reality, by bridging the full scope of the extant traditions, both to redeem the lost sheep of Israel and to fulfil the expectations of the wider backdrop of fertility worship of the nations, leading to Christianity becoming a world religion through its popularity among the gentiles. That said, one can also fairly claim, unlike some docetic gnostic texts that, whatever else may have subsequently happened, Yeshua the man had human DNA and was composed of molecules and cells, consistent with the natural world as we have now discovered it to be, given that his mission took place only once he became around 30 years of age. Again this is not reductionism speaking, it is evidential realism.

3. Forcing the Kingdom of God

The scope of Yeshua's mission goes far beyond Essene ideas of the end of days and constitutes a forcible challenge to bring on the Kingdom of the Father, ostensibly in three days, through a sacrificial confrontation, in which the forces of dark and light are brought into violent conflict, in the persona of Yeshua as the baptised Son of God. The span of Yeshua's mission thus becomes that of a messiah fomenting controversy and chaos focussed on the corruption of Jerusalem, leading to the tragic enactment of the Crucifixion.

This has been portrayed in the Christian account as a sacrificial act, in which God's only begotten son has to die, so that humanity fatally flawed by being infected with the original sin of the serpent can live, provided they believe in him, but otherwise they will burn in hell fire as unredeemed sinners. But whence the origin of this peculiarly pagan sacrificial idea? Why does the God of Creation require his only begotten son to be killed? It is also completely unclear why attacking only certain factors of society deemed to be corrupt serves this purpose. To redeem the sins of the world would require taking on the entire burden of sin, both in the strong rulers and in the weak. Why does inducing a frenzied level of conflict against the authorities in the enactment of a tragedy leading to his own death serve the purpose of defeating sin as a whole? Why is this necessary, or even helpful cosmologically? Isn't it just manufacturing a cosmic war to institute evil as the supreme enemy of God when no such enemy exists?

This conceives a universe entirely inconsistent with the universe as we now know it to be. If God created the universe as we now know it, "He" created the black holes, galaxies, and the four forces of nature and their underlying symmetries and symmetry-breakings necessary for the complexity of the universe to emerge. He also therefore created the physical circumstances in which life can evolve and become conscious. Social morality is not the driving force of the natural world, but a product of it, and climax diversity arises from adventitious mutation, a balance between predators and prey and parasites and hosts, amid a counterpoint between competition and cooperation, in which symbiosis in a dynamic at the edge of chaos has been pivotal. Humanity could not come to exist unless these processes of complexification had been able to play out unhindered. Morality is not a prime motivating force, but a product of complex animal societies that arises naturally, because reduction of internal strife makes a species, or society, more resilient against external competition (Alexander 1987).

There is thus no way that, if a God, or "The" God, created the natural universe, that the appeal of Yeshua to create a religious suicide bomb to blow apart the presumptions of a corrupt and sinful generation, would abruptly, in three days, or in the same generation, bring on the Kingdom in power, by annihilation of a physical universe of 13 billion years stable existence, necessary for conscious life to be able to emerge and evolve.

Not less, there is and can be no credibility to the notion, of purely diabolical proportions, that God the Father would send his pre-existent only begotten divine son into the world as a human being to curse the sins of a corrupt generation and in a preconceived cosmic war between good and evil would commit his Son to be sacrificed to forgive mankind for their sins, while at the same time returning in the same generation in a terminal Day of Judgment as an avenging Lord to judge all for their sins, destroy the natural universe and create a new Jerusalem in the sky, with himself posing as the "Lamb of God" in its very centre. This by its very conception is the core of evil manifest in notions of divinity. There can be no credibility to any such ill conceived notion perpetuated for 2000 years on the cannibalistic notion of consuming the flesh and blood of the saviour or we have no life within us.

4. The Messiah of Light and Dark

What is clear throughout the canonical gospels is that Yeshua's mission, as conceived by the Evangelists, has two complementary and yet discordant themes, leading to inevitable catastrophe.

A. The light side provides the wisdom for which Yeshua is renowned, composed of astute sayings, particularly those which stress compassion. To fully understand the breadth and scope of these it is essential to also consider the contrapuntal sayings of the Gospel of Thomas, which are pivotal in gaining a true perspective.

A key example of the astute sayings is Yeshua's golden rule, which is an inversion of Hillel's earlier (110 BCE – 10 CE) silver rule: "*That which is hateful to you, do not do to your fellow. That is the whole Torah; the rest is the explanation; go and learn*", which Yeshua inverted: Matt 7:12 "*Therefore all things whatsoever ye would that men should do to you, do ye even so to them: for this is the law and the prophets*".

One can immediately see that Yeshua's statement is derived from Hillel's, complete with the trailing "law and prophets" repeating Hillel's "torah". It is also notable that Hillel's statement was prefigured 500 years before by Confucius: "*Never impose on others what you would not choose for yourself*". This gets to the quick of the issue. Both Hillel and Confucius are stating an ethic of avoiding bad acts, respecting the autonomy of others, but Yeshua is going further, invoking active intervention ostensibly for the good. While this may seem beneficial, there is a pitfall demonstrated throughout history. What if the other person or social group doesn't want you to do to them what you would like them to do to you? If a large group of people want a conservative society of a certain kind for themselves, even for their own protection, does this mean it is reasonable for them to pass restrictive laws to enforce it on a diverse society, or is mutual tolerance of differences essential for humanity and for nature to flower? If I want you to have sex with me, is it reasonable for me to proactively have sex with you? The answer is no.

The Sermon on the Mount goes further than mere cooperation and invokes actively rewarding ones enemies twofold:

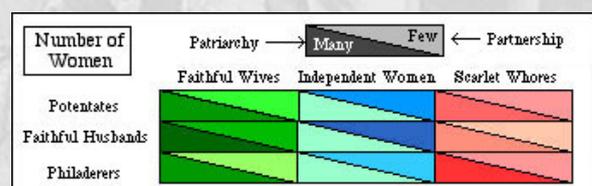

Matt 5:38 "*Ye have heard that it hath been said, An eye for an eye, and a tooth for a tooth: But I say unto you, That ye resist not evil: but whosoever shall smite thee on thy right cheek, turn to him the other also. And if any man will sue thee at the law, and take away thy coat, let him have thy cloak also. And whosoever shall compel thee to go a mile, go with him twain ... Ye have heard that it hath been said, Thou shalt love thy neighbour, and hate thine enemy. But I say unto you, Love your enemies, bless them that curse you, do good to them that hate you, and pray for them which despitefully use you, and persecute you*".

The central question here is this: Are we invoking a paradigm of natural survival in perpetuity, or one in which all care is cast to the winds, because our rewards are in eternal life in Heaven and not on this Earth? Christians extol these passages as pivotal to Yeshua's compassionate teachings, in contrast to the narrower, more punitive "eye for and eye" of Old Testament teachings, but they are unsustainable in the natural world of living survival.

These questions pivot around the prisoners' dilemma of tragic temptation universal to the complementation of cooperation and defection, and hence good and evil. Two prisoners are arrested for a crime. If they cooperate and remain silent they will receive a moderate sentence, but if one betrays the other the one cooperating with the prosecution may get off altogether and the other will go down severely. But this can lead to temptation and both defecting, so they both receive a long punitive sentence. This is the central question around which the ethics revolves and it is also illustrated in the tragedy of the commons (Hardin 1968), where winner-take-all gains tempt people to exploit the common resource before others do and the entire commons is destroyed, just as humanity is doing to the planet today.

Elementary evolutionary prisoners' dilemma game theory (Fielder & King 2004 [D](#)) has established that both **tit-for-tat** – doing to others what they last did to you and **win-stay lose-shift** – switching between cooperation and defection depending on how the payoffs of the last round worked out, out-survive both systematic **cooperation** and systematic **defection**. However tit-for-tat strategies can lead to endless rounds of retaliation characteristic of clan hostilities. Marcus Frean (1994) established a middle ground between eye-for-an-eye and turn-the-other-cheek, called **firm-but-fair**. This is a form of tit-for-tat that turns the other cheek about a third of the time and leads to the firm-but-fair population reaching 98% of the whole, when each party can make their response asynchronously. Always cooperate is a suckers game, which can be invoked only when we have the out of a quick exit to Heaven, in fear of Hell, otherwise it is cumulative suicide. Social dynamics is a prisoners' dilemma between cooperation and defection generalised into order and chaos, in which both sides have essential roles. Violent criminal defection is harmful, while movements opposing oppression by people in power are essential. Complex societies thus involve an equilibrium of cooperation and defection. Again, this is not materialism speaking, but the ethics of constructive diplomacy, to protect the whole for the future of all and the survival of human life and nature.

Fig 212: Prisoners' dilemma of the patriarchs – patriarchal oppression inhibits independent women but cooperating faithful wives and defecting whores can flourish overtly and covertly. Rarity is precious, preventing extinction. A single scarlet woman in a country of faithful wives can claim any man she pleases. A single faithful maiden in a society of loose women may claim the king's hand in marriage.

The Sermon on the Mount also has a strong current of having no care for even moderate self protection of one's own life. Matt 6:25 "*Therefore I say unto you, Take no thought for your life, what ye shall eat, or what ye shall drink; nor yet for your body, what ye shall put on. Is not the life more than meat, and the body than raiment?*"

Nor is there any thought for the future, nor the future of life: Matt 6:34 *“Take therefore no thought for the morrow: for the morrow shall take thought for the things of itself. Sufficient unto the day is the evil thereof.”*

The sayings on the mount are thus being made in a context where no thought needs to be given for survival because of the immanent Kingdom of God in Heaven and the much more dire consequences of being thrown into Hell.

These positive sayings are also mixed with destructive sayings: Matt 5:29 *“And if thy right eye offend thee, pluck it out, and cast it from thee: for it is profitable for thee that one of thy members should perish, and not that thy whole body should be cast into hell. And if thy right hand offend thee, cut it off, and cast it from thee: for it is profitable for thee that one of thy members should perish, and not that thy whole body should be cast into hell”.*

This generosity does not apply to anything except the material: Matt 7:6 *“Give not that which is holy unto the dogs, neither cast ye your pearls before swine, lest they trample them under their feet, and turn again and rend you.”*

It is wonderful that Yeshua considers the lilies of the field, who “toil not” as plants, to be more beautiful than Solomon in all his glory, but the rains fall on good and bad people alike because that is how nature works. The fowls of the air are not fed by God’s grain. The hawks are also part of nature, as are the lion, and all carnivores. Climax life requires an interplay of cooperation and defection. Carnivores’ tooth and claw killings ensure the herbivores don’t become extinct by eating all the plants. Even parasitic diseases end up playing a role in the evolutionary process. Sexuality and hence all complex life has arisen from a Red Queen race between parasites and hosts, in which the endless variations of sexual individuals avoid a pandemic that would wipe out a non-sexual species. Hence individual mortality arises from sexuality and we could not have evolved as humans, or be alive without sexuality and hence the mortal coil.

Yeshua also intimates that any sexual feelings are against the law. Matt 5:28 *“But I say unto you, That whosoever looketh on a woman to lust ⁶⁵ after her hath committed adultery with her already in his heart”.* In a sense anyone who looks on a woman with lust is committing adultery, but as long as they don’t act upon it without the consent of the other, that is an essential manifestation of the natural fertility of sexuality, through which all human beings on this planet have come to exist. Lust is natural and fertility incarnate. It is sexual exploitation that is an evil.

B. The dark side, all the more ominous because it would ultimately lead to Yeshua’s crucifixion, stands out as completely alien to the Hebrew prophetic tradition, claiming to perform nature miracles walking on water and calming the storms on Galilee, bringing people back from the dead, and other actions causing him to be typecast by the scribes as “Baal Zebul” the Lord of Flies, when he cured a man by mere sleight of hand, rather than the traditional methods of faith healing at the time. Yeshua’s response was incendiary, claiming that the scribes were cursing themselves because the devil can’t cast our devils.

Some “miracles” were outright grotesque: After exorcising the legion of spirits of a madman, Yeshua drives a helpless herd of pigs into the lake to drown: Luke 5:13 *“And forthwith Jesus gave them leave. And the unclean spirits went out, and entered into the swine: and the herd ran violently down a steep place into the sea, (they were about two thousand;) and were choked in the sea”.*

The credibility of the miracles wanes in the presence of more familiar company of people rather than excited superstitious crowds seeking faith healing, as noted in Nazareth Mark 6:4:

“A prophet is not without honour, but in his own country, and among his own kin, and in his own house. And he could there do no mighty work, save that he laid his hands upon a few sick folk, and healed them.” Even the disciples did not have confidence in the miracles at least until the wind died on the lake: Mark 6:51 *“And he went up unto them into the ship; and the wind ceased: and they were sore amazed in themselves beyond measure, and wondered. For they considered not the miracle of the loaves: for their heart was hardened.”*

Yeshua’s mission became a three year long enactment of a Dionysian tragedy, just as Dionysian theatre and the three tragedies for one comedy became the cathartic portal in which the lives of men and gods intertwined in ancient Greece, as it remains the nuclear core of all dramatic productions, movies and television series today.

⁶⁵ Matthew’s Greek uses ἐπιθυμέω (epithūméō) to set one’s heart on a thing, desire, covet. Passion has a more benevolent sexual meaning involving infatuation and love, but the Greek πάσχω (páskhō) is “to suffer, to be acted on, to undergo, experience” rather than an act, or desire.

One can have little doubt that controversy and confrontation was anything other than intentional on Yeshua's part, in the light of his first sermon at the synagogue in Nazareth, where despite admitting his own affliction (possibly the lameness mentioned in the Talmud), his incendiary claims caused the people to seek to throw him off the cliffs.

Luke 4:23 *"And he said unto them, Ye will surely say unto me this proverb, Physician, heal thyself: whatsoever we have heard done in Capernaum, do also here in thy country. And he said, Verily I say unto you, No prophet is accepted in his own country. But I tell you of a truth, many widows were in Israel in the days of Elias, when the heaven was shut up three years and six months, when great famine was throughout all the land; But unto none of them was Elias sent, save unto Sarepta, a city of Sidon, unto a woman that was a widow. And many lepers were in Israel in the time of Eliseus the prophet; and none of them was cleansed, saving Naaman the Syrian. And all they in the synagogue, when they heard these things, were filled with wrath, and rose up, and thrust him out of the city, and led him unto the brow of the hill whereon their city was built, that they might cast him down headlong. But he passing through the midst of them went his way".*

Luke's (80–100 CE) description can be taken in one of two ways. A sceptic would say this is a contrivance of the Christian forefathers, calculated to destine Yeshua's mission as being at the outset to the Gentiles rather than Israel, where he will not be accepted and indeed betrayed by the Jews. However, if we accept Luke's account as genuine, then it is Yeshua saying he is opening mission to envelop the gentile religious paradigm from the outset in a clash of the cultures against the existing hierarchy in Israel. This duality extends throughout all the descriptions of Yeshua's mission by all the gospels. Either Yeshua is being misrepresented as forming a bridge to the gentiles by the Christian forefathers to further the Christian interpretation of history as a gentile religion, or Yeshua was himself seeking to form an apocalyptic bridge transcending both the Hebrew religion of the Israelites and the fertility traditions of the nations, when Christianity did not yet exist.

Yeshua's purported miracles fall into three types (a) Healing miracles involving (i) curing sickness, (ii) exorcisms of evil spirits or devils and (iii) three resurrections; (b) Procedural "miracles" in which loaves loaves and fishes are shared among a large congregation in much the manner of a communion wafer; and (c) nature miracles including water into wine, cursing the fig, driving swine to drown after an exorcism and calming and walking on the waters. Ranke-Heinmann (1992) notes Yeshua disdaining demands for the miraculous *"unless you see signs and wonders, you will nor believe"* (John 4.48). *"Why dies this generation seek a sign? Truly I say to you, no sign shall be given to this generation"* (Mark 8.22). She attributes their occurrence to *"a naive addiction to miracles on the part of the authors of the Gospels and their sources"*, noting Elisha's miracles in 2 Kings (4.34 & 6.18).

Spiritual healings were mainstream activities in an era where spiritual cures were sought given limited medical knowledge. It's thus not simply that crowds seek a faith healer because they heal many people but can be the reverse – they appear to heal many people because crowds gather round them seeking a cure. As Ranke-Heinmann puts it *"Crowds didn't stream towards Jesus because he healed many people; rather, because crowds streamed toward him, he healed many people"*. The pool at Bethesda was famous for healing simply via troubled waters. John 5:4 *"For an angel went down at a certain season into the pool, and troubled the water: whosoever then first after the troubling of the water stepped in was made whole of whatsoever disease he had."* The procedural "miracles" were not fundamentally miraculous but just anticipating the communion rite. However, the nature miracles both set Yeshua completely outside the framework of Hebrew religious principles and are systematically consistent with Dionysian traditions.

Fig 213: The three signs of Christ's manifestation on the Epiphany. Water to wine, the baptism and the Magi. Left: Missal of Odalricus - early 12th century (Lavin). Right: Roman Missal. Lower: Dionysian festival of the Epiphany in Greece.

John begins with Yeshua's first miracle at Cana, where his mother says *"They have no wine."* Yeshua says *"Woman, what have I to do with thee? mine hour is not yet come"*, but Mary tells the servants *"Whatsoever he saith unto you, do it"* and Yeshua says *"Fill the water pots with water."* When they take them to the governor, they are fresh wine. This miracle is likely to be an account derived from a lost earlier source listing miracles, as shortly after casually declaring the son of a nobleman near death to be healed, John notes *"This is again the second miracle that*

Jesus did, when he was come out of Judaea into Galilee" (Bultmann 1962 78).

This raises several issues. Why is Yeshua's mother asking him to perform a miraculous feat over a trivial request for alcohol at a wedding? Doesn't this indicate a family operation in miraculous cures? But the third issue is pivotal. Why is Mary inciting Yeshua to perform a miraculous feat known throughout the Near East as the signature of Dionysus as the god of wine and miraculous altered states?

The word Epiphany from the Greek and means "manifestation," "appearance," or "revelation." ... A festival of Dionysus' Advent was kept on this day in the Aegean and Anatolia. The Christian world has conflated three events, all to Jan 6th, the Magi, John's baptism and Cana.

*We keep this day holy in honour of three miracles:
this day a star led the wise men to the manger, this day water was turned to wine at the marriage feast,
this day Christ chose to be baptised by John in the Jordan, for our salvation, allelu-Yah (Magnificat antiphon)*

In a rural area situated in Greece, in Eastern Macedonia, rituals take place at the Epiphany, that coincide with the Orthodox Christian holiday of the baptism of Christ. The locals see no contradiction between the pagan character of their customs and their Christian context, since these rituals are meant to be "a praise to a fertile and good year", a gesture which in turn "rests on the pillars of fruitfulness and productivity". Dionysus, the god of wine, fertility and theatre, was worshipped in the region. A temple dedicated to Dionysus (4th and 3rd centuries BC) is located at the nearby village Kali Vrissi. The vineyards of Drama surround it on all sides. The region's Dionysian heritage is marked by the annual Twelve-Day (Dodekaimero) celebrations, which culminate every year between January 6 to 8 in the region's villages. Noisy parades are held to herald fertility, during which participants strike large bells to awaken Mother Earth. Lots of dancing to the sound of traditional tunes, played with the gaida (bagpipe) and daire (drum), takes place over three days and three nights at the villages of Monastiraki, Kali Vrissi, Petrousa, Pyrgi and Volakas.

Rudolf Bultmann (1962) puts it this way: *"In fact the motif of the story, the transformation the water into wine is a typical motif of the Dionysus legend, in which this miracle serves to highlight the god's epiphany. And hence it is timed to coincide with the feast of Dionysus, from January 5th to 6th. In the ancient church, this affinity was still understood when ... the 6th of January was taken to be the day that the marriage feast was celebrated at Cana"*. The same Christian cooption of pagan festivals occurred with Easter (Ēostre) and Yuletide/Christmas (Odin, Mithras, Saturnalia), but with the Epiphany, Cana implicates Yeshua in the contrivance.

Uta Ranke-Heinman's (1992) position is clear: *"The 6th January became for Christians, the feast of the power revelation (epiphany) of their God, thereby displacing the feast of Dionysus's epiphany. As Bultman says 'No doubt the story has been borrowed from the pagan legends and transferred to Jesus'. On his feast day Dionysus made empty jars fill up with wine in his temple in Elis; and on the island of Andros, wine instead of water flowed from his spring or temple. Accordingly, the true miracle of the marriage feast at Cana would not be the transformation by Jesus of water in wine, but the transformation of Jesus into a sort of Christian wine god"*.

Yeshua's relationship with his family and his friends became more troubled as his spell-binding approach to the mission evolved. *"After this he went down to Capernaum, he, and his mother, and his brethren, and his disciples: and they continued there not many days"* (John 2:12). *"And when his friends heard of it, they went out to lay hold on him: for they said, He is beside himself."* (Mark: 3:21). *"There came then his brethren and his mother, and, standing without, sent unto him, calling him"*, upon which he replied *"whosoever shall do the will of God, the same is my brother, and my sister, and mother"* (Mark 3:31). *"His brethren therefore said unto him, Depart hence, and go into Judaea, that thy disciples also may see the works that thou doest. For there is no man that doeth any thing in secret, and he himself seeketh to be known openly. If thou do these things, shew thyself to the world. For neither did his brethren believe in him"* (John: 7:3). This is also an indirect swipe against James the Just, mentioned as the leader in Thomas:

'The disciples said to Jesus, "We know that you will depart from us. Who is to be our leader?" Jesus said to them, "Wherever you are, you are to go to James the righteous, for whose sake heaven and earth came into being.' (Thom (12)

Metaphors of the winebibber pervade Yeshua's mission. Luke 7.33 *"For John the Baptist came neither eating bread nor drinking wine; and ye say, He hath a devil. The Son of man is come eating and drinking; and ye say,*

Behold a gluttonous man, and a winebibber, a friend of publicans and sinners! But wisdom is justified of all her children.” Mark 2;18 “And no man putteth new wine into old bottles: else the new wine doth burst the bottles, and the wine is spilled, and the bottles will be marred: but new wine must be put into new bottles.” John 15:1 “I am the true vine, and my Father is the husbandman.”

This enactment of his mission as a destined dramatic tragedy on a catastrophic collision course with the forces of darkness, perceived in both the devil and the Jerusalem authorities, religious and secular, ultimately culminated in a series of ritual events, from the necromancy of Lazarus in John, through the march of the palm king and turning the tables in the temple, resulting in Yeshua’s trial and crucifixion for both insurrection against the Romans and blasphemy against the Hebrew tradition, ostensibly set at nought (i.e. castrated) in the Saturnalia by the Roman guards, and later crucified on the Cross, echoing both Psalm 22 and the Canaanite cry of the death god Mot to El:

“And at the ninth hour Jesus cried with a loud voice, saying, Eloi, Eloi, lama sabachthani? – My God, my God, why hast thou forsaken me?” (Matt 15:34)

This doesn’t mean that Yeshua was posing as Dionysus but that he was bringing together all the spiritual currents extant in the greater Israel and its neighbour nations, and adopted currents of Dionysian magical transformation and fertility worship notions of sacrifice of the sacred king, as well as the apocalyptic expectations of the Jewish eschatology in its Zoroastrian-inspired end of days form. These then form a bridge to a new Heaven and a new Earth.

To imbue prophetic validity to Yeshua’s apocalyptic mission, Christian scriptures attempt to conflate these assumed events with passages from the prophets such as Zechariah, where the foolish shepherd brings about an apocalyptic denouement replete with echoes of Judas’ betrayal:

“And the LORD said unto me, Cast it unto the potter: a goodly price that I was prized at of them. And I took the thirty pieces of silver, and cast them to the potter in the house of the LORD” (Zech 11:13).

But the Christian accounts incorrectly attribute this to Jeremiah and Matthew is in double contradiction with Acts:

*“Then Judas, which had betrayed him, when he saw that he was condemned, repented himself, and brought again the thirty pieces of silver to the chief priests and elders, Saying, I have sinned in that I have betrayed the innocent blood. And they said, What is that to us? see thou to that. And he **cast down the pieces of silver in the temple**, and departed, and **went and hanged himself**. And the chief priests took the silver pieces, and said, It is not lawful for to put them into the treasury, because it is the price of blood. And **they took counsel, and bought with them the potter’s field, to bury strangers in**. Wherefore that field was called, *The field of blood*, unto this day. Then was fulfilled that which was spoken by Jeremy the prophet, saying, And they took the thirty pieces of silver, the price of him that was valued, whom they of the children of Israel did value. And gave them for the potter’s field, as the Lord appointed me” (Matt 27:3).*

*“Men and brethren, this scripture must needs have been fulfilled, which the Holy Ghost by the mouth of David spake before concerning Judas, which was guide to them that took Jesus. For he was numbered with us, and had obtained part of this ministry. Now **this man purchased a field with the reward of iniquity; and falling headlong, he burst asunder in the midst**, and all his bowels gushed out. And it was known unto all the dwellers at Jerusalem; insomuch as that field is called in their proper tongue, *Aceldama*, that is to say, *The field of blood*” (Acts 1:16-19).*

Either these “prophecies” were part of a Dionysian enactment, with Jesus and Judas both complicit, or they are a contrived imputation by later writers, who did not have first hand experience of the mission.

5. The Dionysian Heritage

Evidence from the Mycenaean period shows that Dionysus is one of Greece's oldest attested gods 1400 years before Yeshua. His attribute of "foreignness" as an arriving outsider-god may be inherent and essential to his cults, as he is a god of epiphany, sometimes called "the god that comes". With the advent of viticulture in archaic Greece, Dionysus became a god of transformation, and eternal life. His cult involved bands of married women (*thiasoi* - adherents of a deity) periodically retreating to the mountain forests at night to hold an ecstatic revel rout, where through dances and other rituals they experienced the divinity of Dionysus and the release and liberation he afforded as liber, associated with the orgiastic and ecstatic frenzy of his worshipers, including the *maenads* (“raving ones”) who were said to use nightshade to dilate their pupils to make them 'dolorous' from which nightshade’s name Belladonna (“beautiful lady”) comes. In Athens there was a procession on his feast day, when his image was paraded before the crowd, after which he performed a sacred marriage ritual with the king’s wife.

Fig 214: Dionysian parallels: Simone Martini's "Carrying the Cross" shows Mary Magdalene, her face smitten with streaks of blood following Jesus in despair. "*The watchmen that went about the city found me, they smote me, they wounded me; the keepers of the walls took away my veil from me*" Canticles (5:7). Suggested to be one of several secret codas by medieval artists to support the idea that Mary was Yeshua's lover. The women of Galilee figure as the effective maenads of Yeshua, in supporting him out of their substance, in anointing him for his burial and in watching from far off during the crucifixion and announcing his resurrection. Gospel accounts of Yeshua walking on water and rescuing Peter are prefigured in the story of Dionysus miraculously turning the pirates into dolphins when they jump into the ocean in fear of his miraculous manifestations. Inset: two Nabatean and Syrian tragic masks used to confer immortal life on the bearer prefiguring the apocalyptic notion that the death of the saviour is the key to immortal life.

Dionysus, who was the twice born and resurrected ⁶⁶son of God Zeus by mortal Semele, was said to perform a variety of miracles in connection with grapevines and wine, all to do with the god's seasonal epiphany at the time of his festival, evidencing the presence of his divinity. Epiphania means "appearance" in Greek and refers to the revelation of the Lord's power in his appearance. In pagan antiquity, 6 January was the epiphany of Dionysus. Vase paintings depict wine flowing directly from grape clusters, presenting wine as a product of the divine. On the occasion of Dionysus's festival called *Thyria* ("raging"), when Dionysus was thought to be present there, priests under the watch of witnesses placed three empty basins in a building under seal. The next morning when the seal on the door was broken and people entered, the basins were full of wine. In Euripides' *Bacchae*, a maenad struck the ground with her *thyrsus*, "and the god at that spot put forth a fountain of wine."

Dionysus, of all deities, stands as the manifestation of miraculous dread at a level unsurpassed by Yeshua's miracles on Lake of Galilee. The magical metamorphoses of Dionysus are rendered on the Dionysus Cup from around 540-530 BCE by Exekias. A band of Tyrrhenian pirates sailing by the shore happens upon Dionysus and kidnaps him for ransom, believing him to be a wealthy prince binding him to the mast. To their surprise, the fetters fall away from his hands and feet. The ship's helmsman cries out: "*Madmen! What god is this whom you have taken to bind? Do not lay hands on him, lest he grow angry and stir up dangerous winds and heavy squalls.*" His mates do not heed the warning and strange things are seen about them. Sweet, fragrant wine runs streaming throughout the pirates' black ship. Vines dripping with clusters of grapes spread across the tops of the sails, while dark ivy blooming with flowers and berries entwines the ship's mast. Dionysus transforms into a dreadful lion and summons illusions of wild beasts, the leopard or panther, sacred to him, and lions, tigers, and bears. As the beasts lunge, the terrified pirates promptly jump overboard into the sea's cold embrace, but the god enjoys the last laugh as the pirates transform into dolphins upon striking the waves. Only the helmsman, who enjoyed the change of heart, is spared to tell this tale of the wrath of Dionysus.

What is distinctly different about the Dionysian tale is that it is and has always been recognised as mythopoetic allegory, not a physical fact, while Yeshua's alleged miracles and his promises of a return from the dead in power have been crafted by the Christian forefathers to be a claimed cosmological fact more real than the word around us. This is profoundly dangerous, because it lays a false cosmological claim in complete contradiction to every verified form of knowledge, to jam pack the persona of the Son of God into the portal of

⁶⁶ Dionysus, the son of Zeus, was a horned child who was torn to pieces by Titans who lured him with toys, then boiled and ate him. Zeus then destroyed the Titans by thunderbolt as a result of their action against Dionysus and from the ashes humans were formed. However, Dionysus' grandmother Rhea managed to put some of his pieces back together and brought him back to life.

reality to make a claim of ultimate ascendancy over nature on the part of the Son of Man become the Son of God under pain of eternal torment.

The Dionysian connection pervaded the Near East with the rise of Alexander and the ensuing Greek empires and became integral to Syria and Nabatea. Dhushara was an ancient Arabic deity originally represented by a simple stone block in a similar manner to the worship of a stone pillar at Bethel by Jacob, as a non iconic face of the abstract God, as Yahweh was. Gen 35:14: *"Jacob set up a pillar in the place where he had spoken with him, a pillar of stone; and he poured out a drink offering on it, and poured oil on it"*. However with the rise of Nabatean commerce and viticulture, Dhushara gained the persona of the Greek Dionysus, just as al-Uzza, al-lat and Manat gained the forms of Tyche, Atargatis and Aphrodite. Nabatean culture had shrines scattered far and wide across the fertile landscape.

Astral worship came to involve elaborate repasts on triclinia overseen by *"the consecrated and inviolable possession of"* Dhushara, in which concern for making detailed preparations for immortal life had a pivotal focus. Dhushara became the god with the tragic death mask conferring immortal life on the wearer: *"The Nabatean use of the tragic mask furnishes yet another example of their preoccupation with immortality and their intense desire to become identified with their divinity. The mask served as a portrait of the deathless God Dushara, Dusares Dionysos and its wearer became united with him through its use for life everlasting escaping thus the limitations of the mortal span"* (Glueck 242).

Given that these forms of worship extended across the East of the Jordan from Arabia in the South to Syria in the North, and the commercial currents running between East to West by sea, it is inescapable that these currents of deity would have been grist to the mill of religious and apocalyptic ferment.

6. The Women of Galilee and the Daughters of Jerusalem

Yeshua's mission is intimately bound up in the affairs of key women who ministered unto him out of their substance, effectively providing the financial funding for the mission: Luke 8:1 *"And it came to pass afterward, that he went throughout every city and village, preaching and shewing the glad tidings of the kingdom of God: and the twelve were with him, and certain women, which had been healed of evil spirits and infirmities, Mary called Magdalene, out of whom went seven devils, and Joanna the wife of Chuza Herod's steward, and Susanna, and many others, which ministered unto him of their substance"*.

The seven devils are the seven Galla of Inanna-Ishtar that pursued and ravaged Tammuz-Dumuzi, corresponding to the seven layers of hell when the goddess of heaven does her descent, so mentioning them specifically in the gospels casts Mary Magdalene as the sacrificial Queen of Heaven in the piece, preemptively anointing him for his burial after his sacrifice as a sacred king in the shadow of Dumuzi and Tammuz. This means that, as we converge on the crucifixion, there is a relentless parallel with John the Baptist's death in Inanna's Descent enacted by Salome at Macherus. Rather than being anointed by a high priest, as was David and Solomon, Yeshua is anointed by a woman, either on his feet or head and in Mark and John ominously for his burial as a sacred king.

John's account has Mary performing the task. John 12:3 *"Then took Mary a pound of ointment of spikenard, very costly, and anointed the feet of Jesus, and wiped his feet with her hair: and the house was filled with the odour of the ointment. Then saith one of his disciples, Judas Iscariot, Simon's son, which should betray him. Why was not this ointment sold for three hundred pence, and given to the poor? This he said, not that he cared for the poor; but because he was a thief, and had the bag, and bare what was put therein. Then said Jesus, Let her alone: against the day of my burying hath she kept this"*. This appears to link to Luke's reference to Mary playing *"that good part"* in the Dionysian ritual: Luke 10:41 *"And Jesus answered and said unto her, Martha, Martha, thou art careful and troubled about many things: But one thing is needful: and Mary hath chosen that good part, which shall not be taken away from her."*

In Mark, Yeshua is anointed on his head and the pharisees murmur against him because of the cost: Mark 14:3 *"And being in Bethany in the house of Simon the leper, as he sat at meat, there came a woman having an alabaster box of ointment of spikenard very precious; and she brake the box, and poured it on his head. And there were some that had indignation within themselves, and said, Why was this waste of the ointment made? For it might have been sold for more than three hundred pence, and have been given to the poor. And they murmured against her. And Jesus said, Let her alone;*

why trouble ye her? she hath wrought a good work on me. ... She hath done what she could: she is come aforehand to anoint my body to the burying.

Fig 215: Piero della Francesca "The Baptism of Christ", Giovanni de Milano "Anointing", Piero della Francesca "The Crucifixion", Icon "The Holy Myrrh Bearing Women", Titian "Noli me Tangere". The women play a pivotal role in Yeshua's mission and are thus portrayed as witnesses and ritual participants in all the critical events, from the baptism, ministering unto him out of their substance, with Mary Magdalene, out of whom went the seven Galla of Inanna (above) anointing him for his burial, watching over his crucifixion and witnessing the risen Christ.

In Luke this woman is described as a "sinner", interpreted as a prostitute and they murmur because she is a sinner: Luke 7:37 *"And, behold, a woman in the city, which was a sinner, when she knew that Jesus sat at meat in the Pharisee's house, brought an alabaster box of ointment, And stood at his feet behind him weeping, and began to wash his feet with tears, and did wipe them with the hairs of her head, and kissed his feet, and anointed them with the ointment"*.

This sinner has also been associated with Magdalen and with the woman caught in adultery: John 8:3 *"And the scribes and Pharisees brought unto him a woman taken in adultery, saying to Yeshua "Master, this woman was taken in adultery, in the very act" to which he replied He that is without sin among you, let him first cast a stone at her, And they which heard it, being convicted by their own conscience, went out one by one, and so Yeshua said "Woman, where are those thine accusers? hath no man condemned thee? She said, No man, Lord. And Jesus said unto her, Neither do I condemn thee"*.

Yeshua's very fanciful genealogy in Matthew, as King of the Jews, descends through five "fallen" women: (1) Tamar who covered her head with a veil as a prostitute to become impregnated by her father-in-law when he failed to honour betrothing her to a husband's brother on the death of her husband according to Hebrew law. (2) Rahab, the prostitute who let the Israelite spies into Jericho. (3) Ruth who lay with Boaz at night and later became his wife. (4) Bathsheba who sired Solomon with David, although then married to Uriah, whom David later had killed and (5) mother Mary who was found with child out of wedlock and was partnered by Joseph: *"Then Joseph her husband, being a just man, and not willing to make her a publick example, was minded to put her away privily"* (Matt 1:19).

All these women are perceived to be virtuous, but all have at face value sexually transgressed, despite the fact that Mary is claimed by the Christian account to be impregnated by God in the form of the Holy Ghost, just as Semele was impregnated by Zeus.

Likewise the parable of the foolish virgins, which is clearly apocryphal, as it appears only in Matthew, overlays an intensely sexual theme of the Bridegroom entering a marriage ceremony with multiple virgins, at least five of which he consorts with. This is of course an echo of the Jewish relationship of God with the bride Israel, expounded throughout the Old Testament in God's jealousy and violent opposition to the whoring of the nations, taken to a pastoral climax with Rabbi Akiva's adoption of the Song of Songs, one of the most fertile and

haunting love songs ever committed to scripture, as the Holy of Holies, the inner temple sanctum, and which despite its myrrh on the locks enigmatically remains in the Christian bible as the same metaphor.

However the dark side of this parable is that it is used sacrificially. Luke 2:19 *“And Jesus said unto them, Can the children of the bridechamber fast, while the bridegroom is with them? as long as they have the bridegroom with them, they cannot fast. But the days will come, when the bridegroom shall be taken away from them, and then shall they fast in those days”*, again echoing the Dionysian winebibber *“And no man putteth new wine into old bottles: else the new wine doth burst the bottles, and the wine is spilled, and the bottles will be marred: but new wine must be put into new bottles.”*

Christianity thus waits endlessly for the messiah’s Second Coming, in contrast to the fertile quest of the Jews to go forth and multiply as a living species. It thus constitutes a hijacking of the fertility principle to enshrine Christianity as the cosmic portal of salvation.

The women also play a pivotal role in the tragic enactment of the Crucifixion, with the daughters of Jerusalem and the women of Galilee playing opposing parts as a contrapuntal dramatic chorus:

Luke 23:27 *“And there followed him a great company of people, and of women, which also bewailed and lamented him. But Jesus turning unto them said, Daughters of Jerusalem, weep not for me, but weep for yourselves, and for your children. For, behold, the days are coming, in the which they shall say, Blessed are the barren, and the wombs that never bare, and the paps which never gave suck”*.

Luke 23:48 *“And all the people that came together to that sight, beholding the things which were done, smote their breasts, and returned. And all his acquaintance, and the women that followed him from Galilee, stood afar off, beholding these things”*.

Consistent with the Dionysian maenads and fertility traditions of the nations, the women are intimately involved, while the male disciples are scattered like sheep in Yeshua’s hour of need. The women of Galilee were pivotal and Magdalen prominently among them for pronouncing the risen Christ: *“And the women also, which came with him from Galilee, followed after, and beheld the sepulchre, and how his body was laid. And they returned, and prepared spices and ointments; and rested the sabbath day according to the commandment”* (Luke 23:55). Luke 24:10 *“It was Mary Magdalene and Joanna, and Mary the mother of James, and other women that were with them, which told these things unto the apostles.”*

7. Whom do Men say that I Am?

The canonical gospels pivot on the critical assumption that Yeshua is Christ the Son of God who must die and rise again on the third day. Luke 9:20 *“He said unto them, But whom say ye that I am? Peter answering said, The Christ of God. And he straitly charged them, and commanded them to tell no man that thing; Saying, The Son of man must suffer many things, and be rejected of the elders and chief priests and scribes, and be slain, and be raised the third day.”*

Mark has the latter discussions in more detail which indicates that the entire mission was conceived as a confrontational assault on the division of dark and light in which the sacrifice would bring about the Resurrection in three days. When Peter rebukes Yeshua, his response is to call him Satan, confirming the war of dark and light – Matt 12:30 *“if you are not with me, you are against me”*, *“Mark 8:31 And he began to teach them, that the Son of man must suffer many things, and be rejected of the elders, and of the chief priests, and scribes, and be killed, and after three days rise again. And he spake that saying openly. And Peter took him, and began to rebuke him. But when he had turned about and looked on his disciples, he rebuked Peter, saying, Get thee behind me, Satan: for thou savourest not the things that be of God, but the things that be of men.”*

Matt 16:13 *“When Jesus came into the coasts of Caesarea Philippi, he asked his disciples, saying, Whom do men say that I the Son of man am? And they said, Some say that thou art John the Baptist: some, Elias; and others, Jeremias, or one of the prophets. He saith unto them, But whom say ye that I am? And Simon Peter answered and said, Thou art the Christ, the Son of the living God.”*

In his trial, Yeshua confirms he is the Christ and will return in power. Mark 14:61: *“But he held his peace, and answered nothing. Again the high priest asked him, and said unto him, Art thou the Christ, the Son of the Blessed? And Jesus said, I am: and ye shall see the Son of man sitting on the right hand of power, and coming in the clouds of heaven”*.

In complete contrast, in **The Gospel of Thomas**, which begins *"Whoever finds the interpretation of these sayings will not experience death"* Yeshua says he is NOT the disciples master, but they are drunk on his Dionysian spring: Thom (13) *Jesus said to his disciples, "Compare me to someone and tell me whom I am like." Simon Peter said to him, "You are like a righteous angel." Matthew said to him, "You are like a wise philosopher." Thomas said to him, "Master, my mouth is wholly incapable of saying whom you are like." Jesus said, "I am not your master. Because you have drunk, you have become intoxicated from the bubbling spring which I have measured out."* Again a Dionysian metaphor, but also a veridical declaration of truth.

Likewise, the Kingdom, which the canonical gospels declare will come with apocalyptic cataclysm, is the natural world around us obscured by our own barriers to knowing and appreciating reality: Thom (113) *'His disciples said to him, "When will the kingdom come?" Jesus said, "It will not come by waiting for it. It will not be a matter of saying 'here it is' or 'there it is'. Rather, the kingdom of the father is spread out upon the earth, and men do not see it'.*

Rather than a future day of judgment, the new world is already here: Thom (51) *His disciples said to him, "When will the repose of the dead come about, and when will the new world come?" He said to them, "What you look forward to has already come, but you do not recognize it.*

The Kingdom is preceded and evoked by the natural condition in which we all become the sons of God: Thom (3) *Jesus said, "If those who lead you say to you, 'See, the kingdom is in the sky,' then the birds of the sky will precede you. If they say to you, 'It is in the sea,' then the fish will precede you. Rather, the kingdom is inside of you, and it is outside of you. When you come to know yourselves, then you will become known, and you will realize that it is you who are the sons of the living father.*

Thom (20) *The disciples said to Jesus, "Tell us what the kingdom of heaven is like." He said to them, "It is like a mustard seed. It is the smallest of all seeds. But when it falls on tilled soil, it produces a great plant and becomes a shelter for birds of the sky."*

The end of days is not an end but is as it was in the beginning. Thom (18) *The disciples said to Jesus, "Tell us how our end will be." Jesus said, "Have you discovered, then, the beginning, that you look for the end? For where the beginning is, there will the end be. Blessed is he who will take his place in the beginning; he will know the end and will not experience death."*

Nevertheless he reinforces that he is there to provoke conflict and conflagration: Thom (16) *Jesus said, "Men think, perhaps, that it is peace which I have come to cast upon the world. They do not know that it is dissension which I have come to cast upon the earth: fire, sword, and war. For there will be five in a house: three will be against two, and two against three, the father against the son, and the son against the father. And they will stand solitary."*

Yet he will do this by instilling new vision: Thom (17) *Jesus said, "I shall give you what no eye has seen and what no ear has heard and what no hand has touched and what has never occurred to the human mind."*

Perceiving ultimate reality with the mind counterpoints Paul's quote, which stresses loving God: 'But, as it is written, *"What no eye has seen, nor ear heard, nor the human heart conceived, what God has prepared for those who love him"* (1 Corinthians 2:9). This is again different from the Old Testament original *"From ages past no one has heard, no ear has perceived, no eye has seen any God besides you, who works for those who wait for him"* (Isa 64:4), which emphasises Yahwistic monotheism, waiting in in faithful covenant.

The key to the kingdom is childlike innocence: Thom (46) *Jesus said, "Among those born of women, from Adam until John the Baptist, there is no one so superior to John the Baptist that his eyes should not be lowered (before him). Yet I have said, whichever one of you comes to be a child will be acquainted with the kingdom and will become superior to John."* Thom (37) expands hinting that unravelling the Edenic Fall brings back the immortality of the Tree of Life claimed in the opening passage: *Jesus said, "When you disrobe without being ashamed and take up your garments and place them under your feet like little children and tread on them, then [will you see] the son of the living one, and you will not be afraid."*

He says we all have it within us, but warns that what we lack through denial can also kill us. Thom (70) *Jesus said, "That which you have will save you if you bring it forth from yourselves. That which you do not have within you [will] kill you if you do not have it within you."*

And that the undivided unity removing the duality of division is the key: Thom (106) *Jesus said, "When you make the two one, you will become the sons of man, and when you ' say, 'Mountain, move away,' it will move away."*

Thom (22) *Jesus said to them, "When you make the two one, and when you make the inside like the outside and the outside like the inside, and the above like the below, and when you make the male and the female one and the same, so that the male not be male nor the female female; and when you fashion eyes in place of an eye, and a hand in place of a hand, and a foot in place of a foot, and a likeness in place of a likeness, then will you enter [the kingdom]."*

Yeshua sees himself as pure cosmological spirit permeating the natural world. Thom (77) *Jesus said, "It is I who am the light which is above them all. It is I who am the all. From me did the all come forth, and unto me did the all extend. Split a piece of wood, and I am there. Lift up the stone, and you will find me there."*

Yeshua feels afflicted by human ignorance of his insights: Thom (28) *Jesus said, "I took my place in the midst of the world, and I appeared to them in flesh. I found all of them intoxicated; found none of them thirsty. And my soul became afflicted for the sons of men, because they are blind in their hearts and do not have sight; for empty they came into the world, and empty too they seek to leave the world. But for the moment they are intoxicated. When they shake off their wine, then they will repent."*

Some of the sayings tend to a gnostic pessimism about the natural world, but accepting of its potential to produce conscious enlightenment: Thom (29) *Jesus said, "If the flesh came into being because of spirit, it is a wonder. But if spirit came into being because of the body, it is a wonder of wonders. Indeed, I am amazed at how this great wealth has made its home in this poverty."*

He does not say physician heal thyself but acknowledges deftly that a physician does not treat their friends: Thom (31) *Jesus said, "No prophet is accepted in his own village; no physician heals those who know him."*

He makes a cryptic observation that the king will die after the sacred union: Thom (61) *Jesus said, "Two will rest on a bed: the one will die, and the other will live." Salome said, "Who are you, man, that you ... have come up on my couch and eaten from my table?" Jesus said to her, "I am he who exists from the undivided. I was given some of the things of my father." ... "I am your disciple." ... "Therefore I say, if he is destroyed he will be filled with light, but if he is divided, he will be filled with darkness."*

There is a mention of apocalyptic times, but no hint of Christ returning in power: Thom (79) *"A woman from the crowd said to him, "Blessed are the womb which bore you and the breasts which nourished you." He said to [her], "Blessed are those who have heard the word of the father and have truly kept it. For there will be days when you will say, 'Blessed are the womb which has not conceived and the breasts which have not given milk.'"*

Although he rejects Peter's patriarchalism, he still entertains a notion that the male is spiritual: Thom (114) *Simon Peter said to them, "Let Mary leave us, for women are not worthy of life." Jesus said, "I myself shall lead her in order to make her male, so that she too may become a living spirit resembling you males. For every woman who will make herself male will enter the kingdom of heaven."*

Thom (43) *His disciples said to him, "Who are you, that you should say these things to us?" Jesus said to them, "You do not realize who I am from what I say to you, but you have become like the Jews, for they (either) love the tree and hate its fruit (or) love the fruit and hate the tree."*

In complete contrast to the canonical succession through Peter to Paul, Thomas has Yeshua declare that James the Just, his brother the original founder of the Jewish Christian movement was his ordained successor: Thom (12) *The disciples said to Jesus, "We know that you will depart from us. Who is to be our leader?" Jesus said to them, "Wherever you are, you are to go to James the righteous, for whose sake heaven and earth came into being."*

As one final paradoxical counterpoint, we have: (11) *Jesus said, "This heaven will pass away, and the one above it will pass away. The dead are not alive, and the living will not die. In the days when you consumed what is dead, you made it what is alive. When you come to dwell in the light, what will you do? On the day when you were one you became two. But when you become two, what will you do?"*

As a counterpoint to the Gospel of Thomas, Thunder Perfect Mind remains the most enigmatic of the Nag Hammadi texts. It reveals a female presence at least as enigmatic and paradoxically transcendent as Yeshua's persona. Here her statements and Yeshua's are presented as a refrain between female thunder and male lightning.

Dialogue of the Saviours ⁶⁷**Thunder - Perfect Mind**

A: Look upon me you who reflect upon me
and you hearers hear me
You who are waiting for me
take me to yourselves.

*For I am the first, and the last.
I am the honored one and the scorned one.
I am the whore, and the holy one.
the virgin and the wife..*

*I am [the mother] and the daughter....
I am the barren one, and many are her sons
I am she whose wedding is great,
and I have not taken a husband....*

En/lightning El-Nino

B: Look upon me you who reflect upon me.
For I am alpha and omega,
the divine and the blasphemer,
Ba'al Zebul and the Holy Ghost,

the Father and the Son of Man.
I am the father of my mother
and it is my wife who begot me
or ever I was born

I am the Bridegroom
whose communion is celebrated
and I have not
taken a wife.

A: *I am knowledge and ignorance....
I am shameless and ashamed.
I am strength, and I am fear....
I am senseless, and I am wise. ...*

*I am the silence that is incomprehensible
and the idea whose remembrance is frequent.
The voice whose echo is reverberating
the thunder that intoxicates.*

*I am the one whom you have pursued .
I am the one that you have seized.
I am the one that you have scattered
and you have gathered me together.*

B: I am the word made flesh
and yet the bread of life.
I am the good shepherd
and yet the paschal lamb.

I am the true vine
and yet the sprouting rod.
I am the fisher of men
and yet the eye of the storm.

I am the lightning uniting heaven
and earth in rains of plenty.
I am the light of the world
and the darkness at noontide.

A: *The union and the dissolution.
I am the judgment and the acquittal.
I am the shameless one
before whom you are ashamed.*

*Though sinless, I am the root of sin.
The solace even of my labour pains.
I am the meaning of the word
and the very sound of the name.*

*I am the one whom they call Life
and you have called death.
In my weakness do not ever forsake me,
nor ever fear my power.*

B: Split a piece of wood and you will find me there
Lift up a stone and you will find me there
for I am the light above the All
and to me did the All extend.

I am not your master but you've become drunk
from the bubbling stream that I have measured out
and whoever discovers this interpretation
will never experience death

I am the one who returns to loosen the bands
and open the prison to them that are bound.
I am the din that is unendurable.
The epiphany of miraculous dread.

A: *I am the intimate companion of the savior.
He would come to kiss me on my mouth
He asked them "Why do I not love you,
as I love the one who permeates the All?"*

*I am lust in [outward] appearance
and yet I'm the very soul of discretion,
for many are the forms ...
and fleeting pleasures*

*which men embrace, till they become sober
and go up to their resting place.
And there they will find me
and live and not die again.'*

B: I am the one who is called Truth
and I am cast upon the face of the earth.
I am the one who you have despised
and yet you love me all the more.

Why do you curse me and honour me?
Why do you consume and sanctify me?
Why do you leave the body hanging there
when the fire is already alight?

**I bring you to weave, the garments of salvation
and offer you the requital of true love.
In our blood flows the fruit of the Tree of Life
and in our flesh the healing of the nations.**

⁶⁷ Titled in recognition of The Dialogue of the Saviour (Robinson 1990).

8. Descent into Hades and Harrowing Hell

Yeshua's crucifixion and resurrection on the third day, echoes Inanna-Ishtar's descent as the Goddess of Heaven and Earth, into her sister, Ereshkigal's domain of Hell in the three days of the dark moon, stripped naked of her garments one by one in the dance of the seven veils, by the galla, who later sacrifice Tammuz-Dumuzi on her return. Hellenistic writers have, since the crucifixion sought to explain Yeshua's death and perceived ascension, in terms of the Greek cosmology of Hades as the realm of the dead, echoing the Hebrew Sheol, later becoming the increasingly apocalyptic Harrowing of Hell, to delineate a revealed cosmology of God's cosmic manifestation, both forwards in time to the eschatologic apocalypse and backwards in time to the very beginning in Adam, thus trumping both the pagan world and the Judaic Hebrew traditions, as incomplete flawed realisations of the invincible cosmic deity manifesting in history, in the final conversion of Yeshua, the person and apocalyptic prophet into a Hellenistic man-God.

Fig 216: Five views of Christ's descent into Hades the Hellenistic realm of the dead, later hyperbolised into harrowing Hell. Christ leads Adam by the hand Vaux Passional, c. 1504, The Harrowing of Hell - Petites Heures de Jean de Berry, 14th-century, Harrowing Hell - Greek icon, Christ reaches out to Adam and stands on Hades with the broken door behind him, Christ grants salvation to souls by the Harrowing of Hell - Fra Angelico, c. 1430s. This sojourn is initially regarded as to preach to those drowned in the flood, and then extends to preaching to those who dies before Yeshua's time, then extending all the way back to Adam as depicted upper and lower left, thus cementing Christ's reign both forwards to the apocalypse and backward to Eden, claiming Christianity as the divinely ordained faith of the true God of all history.

The word "Hell"—from the Norse, *Hel*; in Latin, *infernus*, *infernus*, *infernus*; in Greek, ᾍδης (Hades); in Hebrew, שְׁאוֹל (Sheol) – is used in

Scripture and the Apostles' Creed to refer to the abode of all the dead, whether righteous or evil, unless or until they are admitted to Heaven. This abode of the dead is the "Hell" into which the Creed says Christ descended. This distinction between Hades and Hell continues, from the earliest creeds to this day, in the varying accounts of the Apostles Creed and its precursors: "he descended to the dead" and "he descended into hell". In the time before it entered the creed, the descent was frequently taken to mean that Christ had gone to rescue the souls of the Old Testament faithful from the underworld, from what Western Catholic theology eventually called the *limbo patrum*.

The Old Testament view of the afterlife was that all people, whether righteous or unrighteous, went to Sheol when they died. No Hebrew figure ever descended into Sheol and returned, although an apparition of the recently deceased Samuel briefly appeared to Saul when summoned by the Witch of Endor. The New Testament maintains a distinction between Hades or Sheol, the common "place of the dead", and the eternal destiny of those condemned at the Final Judgment, variously described as Gehenna, "the outer darkness," or a lake of eternal fire, otherwise known as Hell. The Hellenistic views of heroic descent into the Underworld and successful return follow traditions that are far older than the Orphic and other mystery religions popular at the time of Christ, including that of Gilgamesh and the Odyssey.

Milavec (2021) notes the progression in the view of Christ's descent, which undergoes an apocalyptic extrapolation as time ensues. In Acts 2:23, Peter says that Christ "was not abandoned by God in Hades [ο τε κκατελείφθη ε ι δην]," but says nothing about Jesus preaching in Hades. In 1 Peter however this is specifically described:

"By which also he went and preached unto the spirits in prison, which sometime were disobedient, when once the long suffering of God waited in the days of Noah, while the ark was a preparing, wherein few, that is, eight souls were saved by water." (3:20).

Justin Martyr (d. 165 C.E.) claims it is the Jews who had died prior to the coming of Jesus: *"The Lord God remembered his dead people of Israel who lay in their graves, and he descended to preach to them his salvation"* (Dial. 72.4). The intent here appears to be that the good news of the soon-to-arrive Kingdom of God was being shared with the hundreds of thousands of those Jews from Abraham to John the Baptist. Even though they are admittedly laying in their graves, they receive the message of God's future salvation intended for those "sleeping" in hope. Clement of Alexandria (d. 215 C.E.) tells that the Apostles, following their own deaths, descended into Hades where they preached to the pagan philosophers who had lived righteous lives (Strom. VI, 6:45, 5). The third-century Gospel of Bartholomew portrays the "King of Glory" as descending the stairs of a thousand steps into the underworld. Hades, the god of the underworld, is trembling uncontrollably as he descends. Jesus "shattered the iron bars" of the gates of Hades and grabs the god Hades himself and pummels him "with a hundred blows and bound him with fetters that cannot be loosed" in an operation to save "Adam and all the patriarchs". When Christ meets Adam, he specifically says: "I was hung upon the cross for your sake and for the sake of your children", establishing the backwards causality.

The Catholic Catechism states this forward and backward causality from end to end of time. "In his human soul united to his divine person, the dead Christ went down to the realm of the dead. He opened Heaven's gates for the just who had gone before him." His death is claimed to have freed from exclusion from Heaven the just who had gone before him: "It is precisely these holy souls who awaited their Saviour in Abraham's bosom whom Christ the Lord delivered when he descended into Hell", echoing the words of the Roman Catechism, His death was of no avail to the damned. "By the expression 'He descended into Hell', the Apostles' Creed confesses that Jesus did really die and through his death for us conquered death and the devil 'who has the power of death' (Hebrews 2:14):

Forasmuch then as the children are partakers of flesh and blood, he also himself likewise took part of the same; that through death he might destroy him that had the power of death, that is, the devil; And deliver them who through fear of death were all their lifetime subject to bondage. For verily he took not on him the nature of angels; but he took on him the seed of Abraham.

Given this annihilating redemptive power over the devil, it remains opaque why deadly sin is still deemed to exist.

This Hellenistic view of the underworld extends from the Synoptic Gospels through to Revelation:

"And you, Capernaum, who are exalted to heaven, will be brought down to Hades; for if the mighty works which were done in you had been done in Sodom, it would have remained until this day." (Matt 11:23, Luke 10:15).

"I am He who lives, and was dead, and behold, I am alive forevermore. Amen. And I have the keys of Hades and of Death." (Revelation 1:18)

"The sea gave up the dead who were in it, and Death and Hades delivered up the dead who were in them. And they were judged, each one according to his works." (Revelation 20:13)

In the parable of the rich man and Lazarus the beggar, Luke 16 has Yeshua referring to Hades in a manner that anticipates the punishments of Hell in the Day of Judgment, preordaining it for the guilty as an antechamber of woe. Versions of the Bible continue to predominantly refer to this as Hades or "the dead", with only King James using Hell:

"And being in tormented in Hades, he lifted up his eyes and saw Abraham afar off, and Lazarus in his bosom. And he cried and said, Father Abraham, have mercy on me, and send Lazarus, that he may dip the tip of his finger in water, and cool my tongue; for I am tormented in this flame. But Abraham said, Son, remember that thou in thy lifetime receivedst thy good things, and likewise Lazarus evil things: but now he is comforted, and thou art tormented".

The Gospel of Matthew allegorically relates that many people rose from the dead, and after the resurrection walked about in Jerusalem and were seen by many people there:

"And, behold, the veil of the temple was rent in twain from the top to the bottom; and the earth did quake, and the rocks rent; and the graves were opened; and many bodies of the saints which slept arose, And came out of the graves after his resurrection, and went into the holy city, and appeared unto many. Now when the centurion, and they that were with him, watching Jesus, saw the earthquake, and those things that were done, they feared greatly, saying, Truly this was the Son of God". (Matt. 27:53)

9. Balaam the Lame: Talmudic Entries

In contrast to the Christian gospels, the Talmudic entries cast Yeshua as a false messiah who led Israel into misfortune. These entries portray an antagonism which in itself explains the attitude in the gospels is not merely anti-Jewish

polemic based on the betrayal by the high priests, but genuinely records a spiritual tension about cosmological pretensions that arose from the Crucifixion and the claim to be the Son of God.

The Lexicon Talmudicum and Talmud babli Sanhedrin 106b, 43a, 51a and the Toldoth Yeshu states (Graves 1946 6, 1953 23, 288): *Commentators refer to Yeshu-ha-Notzri [Jesus of Nazareth] by mention of the wicked kingdom of Edom, since that was his nation... he was hanged on a Passover eve... He was near to the kingdom [genealogically].*

Likewise the Qur'an refers to Jesus as Isa after Esau the "red man" of Edom. It thus appears that both the Jews and the Arabs recognised the Edomite character of Jesus' mission in a way not understood by Christians themselves, probably because Muhammad used it from the Jews of Medina. "Isa" is used in his return in divining the day of judgment: Sura 43:61 *He (Isa) is surely a knowledge of the hour. ... And when Isa came with clear arguments he said: I have come to you indeed with wisdom, and that I may make clear to you part of what you differ in. "*

According to hadith, in Sunan of Ibn Majah, Muhammad said, *"There is no Mahdi save Isa son of Maryam". Balaam the lame was 33 years old when Pintias the Robber [Pontius Pilate] killed him... They say that his mother was descended from princes and rulers but consorted with carpenters.*

The Mishnah (Baraita and Tosefta) note the following passages highlighting the tension between conventional Jews and Jesus' followers: *"It has been taught: On the eve of the Passover they hanged Yeshu ... because he practised sorcery and enticed and led Israel astray ... Our Rabbis taught Yeshu had five disciples Mattai, Nakkai, Netzer, Buni, and Todah."* Rabbi Elizah ben Damah is cited asking that Jacob came to heal him in the name of Yeshu[a] ben Pantera. He died being forbidden to do so.

A disciple of Yeshu the Nazarene is cited in Sepphoris capital of Galilee saying *"It is written in your Torah 'Thou shalt not bring the hire of a harlot ...' How about making it a privy for the high priest? Thus did Yeshu ... teach me 'For the hire of a harlot hath she gathered them, And unto the hire of a harlot shall they return', from the place of filth they come, and unto the place of filth they go.*

The Jewish citing of Jesus as son of a Roman 'Pantera' [panther] has been cited as another term of derision insinuating Dionysian heritage, but a Roman gravestone has been found in Bingerbrück Germany for Julius Abdes Pantera, an archer of Sidon, dating from the appropriate early Imperial period.

Another Sanhedrin entry 103a by Rabbi Hisda comments on Psalm 91:10 *"There shall no evil befall thee, neither shall any plague come nigh thy dwelling"* that *"Thou shalt have neither a son nor a disciple who will publicly let his food burn (forfeit his salvation in a public display) like did Jesus the Nazarene".* Rabbi Abbahu taught *"If a man say unto thee 'I am God' he lieth; if he saith 'I am the Son of Man' he will live to rue his words; and if he saith 'I ascend into Heaven' he will not bring to pass that which he saith".*

10. Soma and Sangre: No Redemption without Blood

The Gospels portray Jesus as not just an apocalyptic preacher but preaching a destined death wish to become the sacrificial token of God's so-called love so that sins can be in the day of Judgment. This is a double-edged sword because Jesus will still judge the quick and the dead regardless in the Revelation. It is alien and wholly evil. There is no hint of any assertion that Yahweh ever required such a blood sacrifice. It needs to be exorcised from the Biblical account. It is wrong homicidally destructive and cosmologically degenerate:

*And he began to teach them, that the Son of man must suffer many things,
and be rejected of the elders, and of the chief priests, and scribes, and be killed,
and after three days rise again. And he spake that saying openly (Mark 8:31).*

*For God so loved the world, that he gave his only begotten Son,
that whosoever believeth in him should not perish, but have everlasting life (John 3:16).*

The Crucifixion and the account of the last supper leads to the cannibalistic Eucharist – to seek immortal life by consuming the bread and wine as body and blood of the Saviour:

"Then Jesus said unto them, Verily, verily, I say unto you, Except ye eat the flesh of the Son of man, and drink his blood, ye have no life in you. Whoso eateth my flesh, and drinketh my blood, hath eternal life; and I will raise him up at the last day" (John 6:53).

And as they did eat, Jesus took bread, and blessed, and brake it, and gave to them, and said, Take, eat: this is my body. And he took the cup, and when he had given thanks, he gave it to them: and they all drank of it. And he said unto them, This is my blood of the new testament, which is shed for many (Mark 14:24).

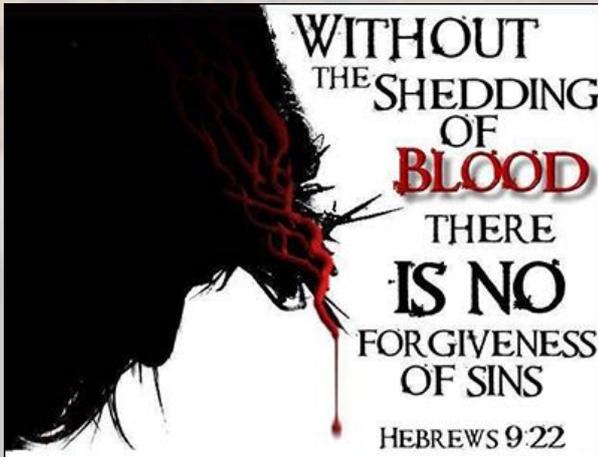

Fig 217: The cannibalistic filicide by God that dooms Christianity to be wholly a religion of evil.

These portrayals of Jesus instructing his followers to eat and drink his flesh and blood as a sacrifice of the only begotten Son by the Father are the most diabolical act ever conceived in human history that renders the Christian cosmology, fraudulent, wholly corrupt and stained to its very core with the blood of needless homicide. God giving his only begotten son as a sacrifice for sin is the equivalent of Huitzilopochtli, the Aztec war god, sacrificing Moctezuma so that his followers could be forgiven their utterly homicidal sins. Its legacy is martyrdom, Empire, Crusade, witch hunt and Inquisition, not to mention Islamic suicide attacks, such as 9-11 as martyrs in acting in Yeshua's image.

This becomes the central Christian thesis: “Without the shedding of blood, there is no remission of sin”, from “*And almost all things are by the law purged with blood; and without shedding of blood is no remission*” (Heb 9:22), in an erroneous exegesis of Lev 17:11: “*For the life of the flesh is in the blood: and I have given it to you upon the altar to make an atonement for your souls: for it is the blood that maketh an atonement for the soul.*”

Hence the Eucharist – consuming the *soma* and *sangre* of the Christ – becomes the central rite of Christianity as a sacramental religion. But the blood spilled is not merely metaphorical, but actual, as ensuing waves of Christian martyrdom, the blood of the Crusades, and the deaths of the Inquisition and Witch Hunts and the genocide of native Americans by the Conquistadors attest.

James Tabor (2012, 2015) astutely traces the origin of Mark 14:24 to a saying by Paul that disclaims direct knowledge of the Eucharist except as a divine communication, not through the disciples or Yeshua's own statement:

One of the more controversial but significant arguments I make in my new book, “[Paul and Jesus](#)”, is that the traditional words attributed to Jesus at the Last Supper—“This is my body,” “This is my blood” over the bread and wine – originated with Paul not with Jesus! Here is a summary of my reasons for reaching this conclusion and I invite readers to explore in depth this and other ways Paul and Jesus differed by reading the book itself.

Here is what Paul writes to the Corinthians around A.D. 54: “For I received from the Lord what I also handed on to you, that the Lord Jesus on the night when he was betrayed took bread, and when he had given thanks, he broke it, and said, “This is my body which is [broken] for you. Do this in remembrance of me.” In the same way also he took the cup, after supper, saying, “This cup is the new covenant in my blood. Do this, as often as you drink it, in remembrance of me” (1 Corinthians 11:23-25).

Mark, our earliest gospel, written between 75-80 A.D. has the following scene of Jesus’ Last Supper: “And as they were eating, he took bread, and after blessing it broke it and gave it to them, and said, “Take; this is my body.” And he took a cup, and when he had given thanks he gave it to them, and they all drank of it. And he said to them, “This is my blood of the covenant, which is poured out for many” (Mark 14:22-24).

The precise verbal similarities between these two accounts are quite remarkable considering that Paul’s version was written at least twenty years earlier than Mark’s. Where would Paul have gotten such a detailed description of what Jesus had said on the night he was betrayed? The common assumption has been that this core tradition, so central to the original Jesus movement, had circulated orally for decades in the various Christian communities. Paul could have received it directly from Peter or James, on his first visit to Jerusalem around A.D. 40, or learned it from the Christian congregation in Antioch, where, according to the book of Acts, he first established himself (Acts 11:25).

What Paul plainly says is easy to overlook: “For I received from the Lord what I handed on to you.” His language is clear and unequivocal. He is not saying, “I received it from one of the apostles, and thus indirectly it came from the Lord,” or “I learned it in Antioch, but they had gotten it by tradition from the Lord.” Paul uses precisely the same language to defend the revelation of his Gospel and how it came to him. He says he did not receive it from any man, nor was he taught it, but swears with an oath, “I

received it through a revelation of Jesus Christ" (Galatians 1:11-12). This means that what Paul passes on here regarding the Lord's Supper, including the words of Jesus over the bread and the wine, comes to us from Paul and Paul alone!

This means that the entire cannibalistic interpretation of Yeshua's sayings at the Last Supper are then repeated by Matthew and Luke based on Mark's account and later wildly embellished by John's interpretation of Jesus as the divine preexisting Logos. This means that Pauline Christianity, the canonical gospels and the entire concept of belief in the flesh and blood man who is also the sacrificed only-begotten Son of God saviour is a product of Hellenistic Judaism contrived as a means to bring about a short-circuit in the stark Zoroastrian notions of the Day of Judgment, or Frashokereti, so that we can all be sinners and have forgiveness and have our cake and eat it too in literal Eucharistic terms, of combined physicality and ultimate divinity, because God incomprehensibly sacrificed his only begotten son.

The Didache, or "Teaching for the Apostles to the Generations", a manual of church rituals contemporary with Matthew I refers to Eucharist of bread and wine, but not in the context of Yeshua's cannibalistic body and blood: *We give you thanks, our Father, for the holy vine of your son David, which you made known to us through your Son Jesus. Yours is the glory unto ages of ages. We give you thanks, our Father, for the life and knowledge which you made known to us through your Son Jesus. Yours is the glory unto ages of ages. As this broken bread was scattered upon the mountains and being gathered together became one, so may your Church be gathered together from the ends of the earth into your kingdom. For yours is the glory and the power through Jesus Christ unto ages of ages.*

Justin Martyr c 150 AD recounts wine mixed with water but again not specifically as Christ's flesh and blood: *There is then brought to the president of the brethren bread and a cup of wine mixed with water; and he taking them, gives praise and glory to the Father of the universe, through the name of the Son and of the Holy Ghost, and offers thanks at considerable length for our being counted worthy to receive these things at His hands.*

In fact the sacred repast of bread and wine is in no way a new invention of Jesus nor of Christianity. Indeed in Genesis we find:

And Melchizedek king of Salem brought forth bread and wine: and he was the priest of the most high God (Gen 14:18).

Moreover Geza Vermes (1961), in addition to noting two messiahs present in the Messianic Rule both of whom are actual humans as in the Jewish messianic tradition he notes that the blessed bread and wine was likely to have been bread and unfermented fruit juice:

Little more is learned from the Community Rule than that when the table had been prepared for eating and the new wine for drinking, the priest was to be first to bless the food and drink. The inference would be that after him, the others did the same, an inference supported by the Messianic Rule where a similar meal is described involving two Messiahs, that of David dealing with war and Aaron as a priestly role. Some uncertainty surrounds the meaning of 'new wine', but it would seem from the use of the scrolls, with the exception of the temple scroll, of the alternative Hebrew words for wine tirosh and yayin that the latter often has pejorative connotations. More likely than not, the wine drunk by the sectaries, the drink of the congregation, was unfermented grape juice'.

Furthermore, he describes the Essene notion of the End of Days as immanent and actual in a conflict between the Teacher of Righteousness and the Wicked Priest, presumably the High Priest of Jerusalem, rather than an urgent hypothetical catastrophic future event, as in Christianity.

Again the position of John the Baptist and its relation to Yeshua's notion of an apocalyptic end of days remains obscure because we have only the canonical gospels and a short passage from Josephus, neither of which are clarifying.

Josephus notes he had a strong following but mentions nothing of Jesus: *"For Herod had killed this good man, who had commanded the Jews to exercise virtue, righteousness towards one another and piety towards God. Many people came in crowds to him, for they were greatly moved by his words."*

Mark notes:

In those days came John the Baptist, preaching in the wilderness of Judaea, saying, Repent ye: for the kingdom of heaven is at hand.

Luke goes further and has John's disciples come to test Jesus:

And John calling unto him two of his disciples sent them to Jesus, saying, Art thou he that should come? or look we for another? Then Jesus answering said unto them, Go your way, and tell John what things ye have seen and heard; how that the blind see, the lame walk, the lepers are cleansed, the deaf hear, the dead are raised, to the poor the gospel is preached. For John the Baptist came

neither eating bread nor drinking wine; and ye say, He hath a devil. The Son of man is come eating and drinking; and ye say, Behold a gluttonous man, and a winebibber, a friend of publicans and sinners! But wisdom is justified of all her children.

John has the Baptist lavishly extolling Yeshua as the promised one but neither does this tell us anything about John's own thinking or whether Jesus was supposed to be sacrificed to God to end sin:

John bare witness of him, and cried, saying, This was he of whom I spake, He that cometh after me is preferred before me: for he was before me. I baptize with water: but there standeth one among you, whom ye know not; He it is, who coming after me is preferred before me, whose shoe's latchet I am not worthy to unloose. The next day John seeth Jesus coming unto him, and saith, Behold the Lamb of God, which taketh away the sin of the world. And John bare record, saying, I saw the Spirit descending from heaven like a dove, and it abode upon him. And I knew him not: but he that sent me to baptize with water, the same said unto me, Upon whom thou shalt see the Spirit descending, and remaining on him, the same is he which baptizeth with the Holy Ghost. Ye yourselves bear me witness, that I said, I am not the Christ, but that I am sent before him.

James Tabor (2012) notes that all the canonical gospels are anonymous productions, written a generation after the apostles. Scholars are agreed that none are an eyewitness account and the names associated with them are assigned by tradition, not by explicit claim by their authors in the texts. Mark, which comes first, gives no account of Jesus' birth miraculous or otherwise and in his original version, no post-resurrection appearances of Jesus to his disciples. In addition to Mark, both Matthew and Luke had access to the Q sayings source, probably dating from around AD 50 in which Jesus never speaks of his resurrection from the dead, while Mark, who comes later, refers several times to being raised on the third day. John comes last and is the most theologically embellished in terms of its view of Jesus as the divine, preexistent one of God. This gives a good indication of how mythical rather than historical the canonical gospels are and decisively discredits the canonical gospel accounts as any kind of accurate record of Yeshua's actual life, but rather the products of later beliefs. It reduces our understanding of Yeshua closer to that of Crossan (1991).

Hence we can very tentatively let Yeshua off the hook of both claiming Abba sacrificed him, as a Johanne extrapolation of Pauline thinking and the Eucharist as Paul's own cannibalistic folly and judge Yeshua's chaos messiahship directly in terms of its consequences, especially in the immediate epidemic of martyrdoms.

Elaine Pagels (1988 33-6) describes the way in which the Kingdom of the Father has led to precipitate and tortured death on the part of a young female Christian believer. Whatever their courage and conviction, the prophesied Kingdom has been too long in coming to justify such needless loss of life. The fallacy that the Kingdom was about to arrive was shared by groups such as the Montanists. Perpetua's sacrifice of herself is even more poignant in a young girl. Because her name is Perpetua she remains forever a living symbol in her precipitate martyrdom of that physical immortality which is vested in the passage of the generations through the fecundity of the female line.

Vibia Perpetua, fluent in both Greek and Latin, wrote about her experiences from the time of her arrest until the evening of her execution. Perpetua, twenty-two years old, recently married, and nursing her infant son, was arrested along with her friends and her personal slave Felicitas. Perpetua and her companions were scourged and thrown into a stifling and crowded African jail. After her arrest, Perpetua's father, .. *"out of love for me,"* she wrote, *"was trying to persuade me to change my decision."* Refusing his pleas to give up the name Christian, Perpetua rejected her familial name instead, although she says she grieved to see her father, mother, and brothers *"suffering out of compassion for me."* At first, she wrote, *"I was tortured with worry for my baby there,"* but after she gained permission for him to stay with her in prison, *"at once I recovered my health, relieved as I was of my worry and anxiety for the child."*

Then my brother said to me, "Dear sister, you already have such a great reputation that you could ask for a vision indicating whether you will be condemned or freed." Since I knew that I could speak with the Lord, whose great favors I had already experienced, I confidently promised to do so. I said I would tell my brother about it the next day. Then I made my request and this is what I saw. There was a bronze ladder of extraordinary height reaching up to heaven, but it was so narrow that only one person could ascend at a time. Every conceivable kind of iron weapon was attached to the sides of the ladder: swords, lances, hooks, and daggers. If anyone climbed up carelessly or without looking upwards, he/she would be mangled as the flesh adhered to the weapons. Crouching directly beneath the ladder was a monstrous dragon who threatened those climbing up and tried to frighten them from ascent. I began my ascent. At the summit I saw an immense garden, in the center of which sat a tall, grey-haired man dressed like a shepherd, milking sheep. Standing around him were several thousand white-robed people. As he raised his head he noticed me and said, "Welcome, my child." Then he beckoned me to approach and gave me a small morsel of the cheese he was making. I accepted it with cupped hands and ate it. When all those surrounding us said "Amen:" I awoke, still tasting the sweet cheese. I immediately told my brother about the vision, and we both realized that we were to experience the sufferings of martyrdom. From then on we gave up having any hope in this world (Young 47).

Hilarianus the governor, who had received his judicial powers as the successor of the late proconsul Minucius Timinianus, said to me: "Have pity on your father's grey head; have pity on your infant son. Offer the sacrifice for the welfare of the emperors." "I will not," I retorted. "Are you a Christian?" said Hilarianus. And I said: "Yes, I am. When my father persisted in trying to dissuade me, Hilarianus ordered him to be thrown to the ground and beaten with a rod. I felt sorry for my father, just as if I myself had been beaten. I felt sorry for his pathetic old age. Then Hilarianus passed sentence on all of us: we were condemned to the beasts, and we returned to prison in high spirits.

On the day before her execution, Perpetua wrote down another vision: She dreamed that she was led to the amphitheater, where enormous crowds waited to see her fight with a ferocious Egyptian athlete. *'Then a certain man appeared, so tall that he towered above the amphitheater. He wore a loose purple robe with two parallel stripes across the chest; his sandals were richly decorated with gold and silver. He carried a rod like that of an athletic trainer, and a green branch on which were golden apples. He motioned for silence and said, "If this Egyptian wins, he will kill her with the sword; but if she wins, she will receive this branch" Then he withdrew. "My clothes were stripped off, and suddenly I was a man." She fought and wrestled until she got him into a headlock and so won the fight. "But when I saw that we were wasting time, I put my two hands together, linked my fingers, and put his head between them. As he fell on his face I stepped on his head. Then the people began to shout and my assistants started singing victory songs. I walked up to the trainer and accepted the branch. He kissed me and said, 'Peace be with you, my daughter" And I triumphantly headed towards the Sanavivarian Gate. Then I woke up realizing that I would be contending not with wild animals but with the devil himself, but I knew that I would win the victory.'*

Two days before the execution, the Christians prayed for Felicitas in one torrent of common grief, and immediately after their prayer the labor pains came upon her. She suffered a good deal in her labor because of the natural difficulty of an eight-month delivery. One of the Christian women took the infant daughter to raise as her own, leaving Felicitas free to join her companions.

Fig 218: Left: "The Death of Sapphira" Ambrosius Francken the Elder. Right: "Triumph of Faith" Eugene Thirion

When the day arrived, Perpetua and Felicitas, together with their Christian brothers Revocatus, Saturninus, and Satorus, were led out of the prison to the gates of the amphitheater. The officer in charge, following the common practice, ordered the men to dress in robes of priests of the god Saturn, and the women to dress in the costumes of priestesses of the goddess Ceres, as if they were offering their deaths in sacrifice to the gods. Perpetua adamantly refused, saying: *"We came to this of our own free will, so that our liberty should not be violated. We agreed to pledge our lives in order to do no such thing [as sacrifice to the gods]. And you agreed with us to do this."* Again her plea prevailed, and the officer yielded. But just as Perpetua and Felicitas were to enter the arena, they were forcibly stripped naked and placed in nets, so that even the crowd was horrified when they saw that one was a delicate young girl, and the other woman fresh from childbirth, with milk still dripping from her breasts. A mad heifer was set loose after them; Perpetua was gored and thrown to the ground. She got up and, seeing Felicitas crushed and fallen went over to her and lifted her up, and the two stood side by side. Then after undergoing further ordeals and seeing their friend Satorus endure agonising torture. Perpetua and Felicitas, along with the others were called to the centre of the arena to be slaughtered. A witness records that Perpetua *"screamed as she was struck on the bone; then she took the trembling hand of the gladiator and guided it to her throat"*.

Given the time sequence outlined in [fig 211](#), the credibility of the canonical gospels concerning Yeshua's actual life remains tenuous to contrived. The Hellenistic role of Paul as the founder of the church as its entire religious view of Yeshua's mission is made clear in the section on [Hellenistic-Judaism](#). Paul, whose conversion on the road to Damascus is claimed to have occurred 31–36 CE shortly after the crucifixion dated to 33 CE, admits he had no direct contact with Yeshua: "Last of all, as to one untimely born, He appeared to me also." He was martyred in Rome in 64-67 CE around

the time of the Fall of Jerusalem. Mark was written 66–74 CE with earlier dates 35–45 generally dismissed. But Luke's account in his gospel and Acts dates from 80–90 CE and possibly as late as 110 CE. How then can Acts portray direct personal accounts of the Apostles leading up to Pentecost, remains as implausible as the canonical gospel accounts of Yeshua's mission.

Moreover, the ensuing events are fraught with conflicts with the Jews, or Jewish Christian resisters to the gentile mission, and negative 'miraculous' events associated with anything but compassion or realisation. Ananias and Sapphira donated to the cause, but kept back some of their capital and were both literally frightened to death for not giving all, ostensibly by the Holy Ghost, but actually by the assembled company, contrived as a miraculous act, demonstrating the need for utter submission to the Christian cause.

Having lost his sight on the Road to Damascus, while persecuting early disciples of Yeshua, possibly Hellenised diaspora Jews converted to Christianity, and blinded by a "light from heaven", Saul had his sight restored by Ananias. He is initially rejected by the disciples as "they were all afraid of him, and believed not that he was a disciple". Later Paul appears in a conflict with Barjesus, a Jew, disclaimed as a sorcerer, whose superior the deputy Sergius Paulus sought to "hear the word of God". But Elymas the sorcerer withstood them:

"Then Saul, (who also is called Paul,) filled with the Holy Ghost, set his eyes on him. And said, O full of all subtilty and all mischief, thou child of the devil, thou enemy of all righteousness, wilt thou not cease to pervert the right ways of the Lord? And now, behold, the hand of the Lord is upon thee, and thou shalt be blind, not seeing the sun for a season. And immediately there fell on him a mist and a darkness; and he went about seeking some to lead him by the hand. Then the deputy, when he saw what was done, believed, being astonished at the doctrine of the Lord."

How far have we fallen into misuse of the very principles of redemption? Who is the wicked sorcerer here? The man who curses another with blindness, having suffered blindness himself, or the man who sought to avoid the cult indoctrination of the deputy?

11. The False Dawn of the Prophesied Kingdom

The acid test of Yeshua's mission is the actual appearance of the Kingdom with power in the same generation of those present when he was alive:

Mark 8:38 "Whosoever therefore shall be ashamed of me and of my words in this adulterous and sinful generation; of him also shall the Son of man be ashamed, when he cometh in the glory of his Father with the holy angels. And he said unto them, Verily I say unto you, That there be some of them that stand here, which shall not taste of death, till they have seen the kingdom of God come with power."

Luke 21:32 Verily I say unto you, This generation shall not pass away, till all be fulfilled. Heaven and earth shall pass away: but my words shall not pass away. And take heed to yourselves, lest at any time your hearts be overcharged with surfeiting, and drunkenness, and cares of this life, and so that day come upon you unawares. For as a snare shall it come on all them that dwell on the face of the whole earth.

But in Matthew 24 the passage is stunning in its sweep and unremitting declaration of a cosmological Armageddon apocalypse in Yeshua's own generation:

And as he sat upon the mount of Olives, the disciples came unto him privately, saying, Tell us, when shall these things be? and what shall be the sign of thy coming, and of the end of the world?

The ensuing apocalypse in true Revelation style, is then claimed to be Yeshua's own words:

And Jesus answered and said unto them, Take heed that no man deceive you. For many shall come in my name, saying, I am Christ; and shall deceive many. And ye shall hear of wars and rumours of wars: see that ye be not troubled: for all these things must come to pass, but the end is not yet. For nation shall rise against nation, and kingdom against kingdom: and there shall be famines, and pestilences, and earthquakes, in divers places. All these are the beginning of sorrows.

The persecution of the Christians is then declared:

Then shall they deliver you up to be afflicted, and shall kill you: and ye shall be hated of all nations for my name's sake. And then shall many be offended, and shall betray one another, and shall hate one another. And many false prophets shall rise, and shall deceive many. And because iniquity shall abound, the love of many shall wax cold. But he that shall endure unto the end, the same shall be saved. And this gospel of the kingdom shall be preached in all the world for a witness unto all nations; and then shall the end come.

We then come to the abomination and tribulations of Daniel:

When ye therefore shall see the abomination of desolation, spoken of by Daniel the prophet, stand in the holy place, (whoso readeth, let him understand:) Then let them which be in Judaea flee into the mountains: Let him which is on the housetop not come down to take any thing out of his house: Neither let him which is in the field return back to take his clothes.

Then the woe to the pregnant and breastfeeding mothers:

And woe unto them that are with child, and to them that give suck in those days! But pray ye that your flight be not in the winter, neither on the sabbath day: For then shall be great tribulation, such as was not since the beginning of the world to this time, no, nor ever shall be. And except those days should be shortened, there should no flesh be saved: but for the elect's sake those days shall be shortened.

Then we have accounts of the false Messiahs:

Then if any man shall say unto you, Lo, here is Christ, or there; believe it not. For there shall arise false Christs, and false prophets, and shall shew great signs and wonders; insomuch that, if it were possible, they shall deceive the very elect. Behold, I have told you before. Wherefore if they shall say unto you, Behold, he is in the desert; go not forth: behold, he is in the secret chambers; believe it not. For as the lightning cometh out of the east, and shineth even unto the west; so shall also the coming of the Son of man be. For wheresoever the carcase is, there will the eagles be gathered together.

Then we enter full fledged Armageddon with the stars falling from the sky, angels and trumpets:

Immediately after the tribulation of those days shall the sun be darkened, and the moon shall not give her light, and the stars shall fall from heaven, and the powers of the heavens shall be shaken: And then shall appear the sign of the Son of man in heaven: and then shall all the tribes of the earth mourn, and they shall see the Son of man coming in the clouds of heaven with power and great glory. And he shall send his angels with a great sound of a trumpet, and they shall gather together his elect from the four winds, from one end of heaven to the other. Now learn a parable of the fig tree; When his branch is yet tender, and putteth forth leaves, ye know that summer is nigh: So likewise ye, when ye shall see all these things, know that it is near, even at the doors.

But in the very midst, Yeshua is said to claim all his supernatural unveiling and cosmic cataclysm will occur in the same generation as those present:

Verily I say unto you, This generation shall not pass, till all these things be fulfilled.

Next Noahs flood re-ensues in which half the living are taken:

Heaven and earth shall pass away, but my words shall not pass away. But of that day and hour knoweth no man, no, not the angels of heaven, but my Father only. But as the days of Noe were, so shall also the coming of the Son of man be. For as in the days that were before the flood they were eating and drinking, marrying and giving in marriage, until the day that Noe entered into the ark, And knew not until the flood came, and took them all away; so shall also the coming of the Son of man be. Then shall two be in the field; the one shall be taken, and the other left. Two women shall be grinding at the mill; the one shall be taken, and the other left. Watch therefore: for ye know not what hour your Lord doth come.

Finally Christ comes as a thief in the night in the parable of the goodman, but here Luke 12:40 is earlier in the mission contradicting Matthew 24:44 in the timing:

"And this know, that if the goodman of the house had known what hour the thief would come, he would have watched, and not have suffered his house to be broken through. Be ye therefore ready also: for the Son of man cometh at an hour when ye think not."

Matthew's statement is implausible and incredible in every conceivable way. For Yeshua's claimed statement to be true, not only would nation have to rise against nation, which did eventuate in the siege of Jerusalem 30 years later, but the stars would have to fall from the sky amid the greatest tribulation since the beginning of the world, yet this is all claimed to take place while the living standing before him are still alive. No one reading this can have any honest reaction but to realise that either it is a retrospective contrivance on the author's part, or that Yeshua's claims in the light of ensuing events are those of a false messiah, in both cases a historical fallacy.

Given the date of writing of the synoptics, Elaine Pagels (2012) points out that these passages and those of Revelation occurred after the siege of Jerusalem in CE 66, in a time when Christian faith of the minority of followers who still believed in Yeshua had their faith restored by these events as signs of preliminary “pangs of the messiah” before the Lord’s return in power.

Nevertheless, these statements claimed in the gospels to be direct from Yeshua, taken anywhere near face value, despite severe doubts that many of them are inserted to fulfil Pauline interpretations of the Son of God, indicate the intention of his mission to be to bring about by his crucifixion the Kingdom of God through tumultuously violent events. This led to an urgent anticipation by early Christians that the kingdom was at hand, encouraging many to become martyrs rather than denounce their beliefs to the Romans.

There is silence all around. The Baptist appears, and cries: “Repent, for the Kingdom of Heaven is at hand.” Soon after that comes Jesus, and in the knowledge that He is the coming Son of Man lays hold of the wheel of the world to set it moving on that last revolution which is to bring all ordinary history to a close. It refuses to turn, and He throws Himself upon it. Then it does turn; and crushes Him. Instead of bringing in the eschatological conditions, He has destroyed them. The wheel rolls onward, and the mangled body of the one immeasurably great Man, who was strong enough to think of Himself as the spiritual ruler of mankind and to bend history to His purpose, is hanging upon it still. That is His victory and His reign.
(Albert Schweitzer, *The Quest of the Historical Jesus* (2001 654))

I can sympathise and even empathise with Yeshua’s position. The visionary experience is all consuming, as it is a singular relationship between the individual and what is the Godhead by any other name. Hence the references to the Father as an intimate parental relationship. This means that the visionary is and has to be prepared to do whatever it takes to fulfil the visionary responsibility that has been thrust upon them by circumstances. At the time the world was beset, not so much by environmental apocalypse, but nation against nation. The religious mindset led straight into an apocalypse and if our history serves us well John the Baptist laid this sense of immediate responsibility onto Yeshua in his baptism.

If I were in Yeshua’s time and place, I could easily have taken the same position. In a sense his apprehension was fulfilled, because in 66 CE Armageddon ensued in the holocaust of the siege of Jerusalem, in which Josephus recounts over a million lives were lost, resulting in a Jewish diaspora that still exists to this day. The idea that one should trade one’s mortal life for a renewal of the entire world condition of everyone alive is a transaction no compassionate being thrust into the visionary vortex can fairly abandon. Indeed today if I thought that my own death could secure the ongoing diversity of immortal life on the planet from risk of extinction, I would be psychologically obliged to do it, because not doing so will not save me from mortality, but condemn the fates of endless others throughout the future. But this is not the way of true redemption.

By the end of the first century it had become obvious that Yeshua’s messianic expectation had failed to arrive and the Christian forefathers, in the wake of the Pauline heresy of Hellenistic-Judaism – a form of Judaism in classical antiquity that combined Jewish religious tradition with elements of Greek culture, recrafted Yeshua’s mission in their own image of reality. Hence the infusion of pagan Greek elements into the early Christian accounts pervading both Paul’s writings and those of Luke, who unashamedly wrote his gospel in high Greek. Paul was born Saul in Tarsus, which had been among the most influential cities in Asia Minor since the time of Alexander the Great, who died in 323 BC. Although it is known (from his biography and from Acts) that Paul could and did speak Hebrew, modern scholarship suggests that Koine Greek ⁶⁸was his first language. All of Mark, Luke, Matthew and John wrote in Greek, not Hebrew or Aramaic. Luke’s Greek is the highest quality in style of anything in the new testament. This constitutes a frank reconstruction of history to forge a new implicitly fraudulent pagan gentile religion on the assumed basis of Yeshua’s mission and teachings powered by such single-minded conviction that countless martyrs intentionally suffered horrific deaths for no good cause.

The Gospel of Thomas also appears to have been originally written in Greek. After the Coptic version of the complete text was discovered in 1945 at Nag Hammadi, scholars realised that three different Greek text fragments previously found at Oxyrhynchus (the Oxyrhynchus Papyri), also in Egypt, were part of the Gospel of

⁶⁸ *Koine Greek* 'Common Greek', also known as Alexandrian dialect, common Attic, Hellenistic or Biblical Greek, was the common supra-regional form of Greek spoken and written during the Hellenistic period, the Roman Empire and the early Byzantine Empire.

Thomas. These three papyrus fragments of Thomas date to between 130 and 250 AD. The manuscript of the Coptic text (CG II), found in 1945 at Nag Hammadi, Egypt, is dated at around 340 AD.

This virtual universality of Greek occurs despite the suggestion that some documents, such as the Quelle source, may have originally been written in Aramaic. The transition to Greek happened very early:

"[M]issionaries, above all 'Hellenists' driven out of Jerusalem, soon preached their message in the Greek language. We find them in Damascus as early as AD 32 or 33. A certain percentage of Jesus' earliest followers were presumably bilingual and could therefore report, at least in simple Greek, what had been heard and seen. This probably applies to Cephas/Peter, Andrew, Philip or John. Mark, too, who was better educated in Jerusalem than the Galilean fishermen, belonged to this milieu. The great number of phonetically correct Aramaisms and his knowledge of the conditions in Jewish Palestine compel us to assume a Palestinian Jewish-Christian author. Also, the author's Aramaic native language is still discernible in the Marcan style" (Hengel 2005).

The earliest Christian writing is 1 Thessalonians, dated circa CE 50. In it Paul's message is to wait and not slumber, for the son of man shall come at any time hence, in the Rapture in the air:

"And to wait for his Son from heaven, whom he raised from the dead, even Jesus, which delivered us from the wrath to come. For the Lord himself shall descend from heaven with a shout, with the voice of the archangel, and with the trump of God: and the dead in Christ shall rise first: Then we which are alive and remain shall be caught up together with them in the clouds, to meet the Lord in the air: and so shall we ever be with the Lord. Wherefore comfort one another with these words. But of the times and the seasons, brethren, ye have no need that I write unto you. For yourselves know perfectly that the day of the Lord so cometh as a thief in the night. For when they shall say, Peace and safety; then sudden destruction cometh upon them, as travail upon a woman with child; and they shall not escape. ... Therefore let us not sleep, as do others; but let us watch and be sober."

In the light of our burgeoning knowledge of cosmology, the Rapture in the clouds is a dangerous contrivance. What is both alarming and appalling is that it is now over 2000 years since the Crucifixion and the Christian religion, despite failing to convincingly prove the acid test of veracity by the Fall of Jerusalem in CE 66, which committed virtually the entire generation in Yeshua's presence to oblivion, has locked itself into a perpetual delay of the Kingdom, claiming a false remit of authority, refusing to honestly admit to humanity the entire edifice of belief is a pagan contrivance, holding imperatively to the claimed status of being the ordained stewards of the Lord's return in the End of Days, the Day of Judgment, as diabolically described in Revelation's multiple genocides. This position is inconsistent with the paradoxical visionary immanence of Yeshua's own teachings, particularly those in the Gospel of Thomas, and strategically fixes the persona of Yeshua as pagan the Christ Son of God into the portal of reality, in a cosmological lie, preventing any evolution of the tradition through the insight of living people to address the actual needs of humanity and the living planet.

Paul's 'rapture', is both completely unnatural, and profoundly dangerous, because it leads to many Christians today imagining the second coming of Jesus as the heavenly rapture in which the 'late planet Earth' is carelessly discarded for an eternal life in mid-air. This completely frustrates being able to address the apocalyptically urgent questions of avoiding a planetary Armageddon from human misadventure disrupting the climate depleting Earth's resources and causing a mass extinction of the diversity of life, turning the planet from an immortal paradise into a potentially lethal man-made hell.

12. Transcending the Bacchae: Revelation and Cosmic Annihilation

The **Bacchae**, written by Euripides around 405 BCE, is considered to be not only one of Euripides's greatest tragedies, but also one of the greatest dramatic works ever written, modern or ancient. A clear exception has to be Yeshua's mission and Crucifixion which has clearly reverberated unparalleled throughout two millennia of blood spilled in the name of Christianity in martyrdom, Crusade, inquisition and witch hunt.

The Bacchae recounts in violent detail the slaying of Pentheus by the maenads and the reformation of religious practice in Thebes for not recognising the true divinity of the Son of God. To many Christians it may seem an antithesis of all that is good in Yeshua's compassionate sayings, but the consequences of the Kingdom coming with power invoked slaughter on a genocidal scale which leaves the single murder in the Bacchae paling to insignificance.

Semele, was a princess in the royal Theban house of Cadmus. She had an affair with Zeus, the King of the Gods, and became pregnant. As revenge, Zeus's jealous wife Hera tricked Semele into asking Zeus to appear in his divine form. Zeus, too powerful for a mortal to behold, emerged from the sky as a bolt of lightning and burnt Semele to a cinder. He managed, however, to rescue his unborn son Dionysus and stitched the baby into his thigh. This means that the historical journey of the concept of the Son of God by a mortal woman runs from Dionysus to Yeshua 500 years later.

Semele's family claimed that she had been struck by lightning for lying about Zeus and that her child, the product of an illicit human affair, had died with her, maligning her name and rejecting the young god Dionysus. Dionysus arrives in Thebes disguised as the stranger. During Dionysus's absence, Semele's father, Cadmus, had handed the kingdom over to his grandson Pentheus, who decided to forbid the worship of Dionysus. Dionysus tells the audience that when he arrived in Thebes he drove Semele's sisters mad, and they fled to Mt. Cithaeron to worship him and perform his rites on the mountainside. Unconvinced of their divinely-caused insanity, Pentheus sees their drunken cavorting as an illicit attempt to escape the mores and legal codes regulating Theban society. He orders his soldiers to arrest the Lydian stranger and his maenads. He orders Dionysus to be chained, bound and tortured, but Dionysus escapes his bands. Similar stories are told in the Pauline letters. When he tries to tie Dionysus he ties only a bull, and when he plunges a knife into Dionysus, the blade passes only through shadow. Suddenly an earthquake shakes the palace, a fire starts.

Dionysus tries to persuade Pentheus to abandon his destructive path, but Pentheus refuses. A cowherd arrives and describes sighting the maddened women of Cadmus seen resting blissfully in the forest, feasting on milk, honey and wine that sprang from the ground. They played music, suckled wild animals and sang and danced with joy. But when they saw the cowherd, they flew into a murderous rage. The cowherd barely escaped, but the herd of cattle was captured and torn apart by hand.

Dionysus offers Pentheus a chance to see the maenads for himself, undetected. He agrees to do all Dionysus suggests, dressing himself in a wig and long skirts. Once in the woods, Pentheus cannot see the bacchantes from the ground, and wants to mount a tree for a better vantage. Dionysus miraculously bends a tall fir tree, puts Pentheus on top, and gently straightens the tree. At once the maenads see him, and with rolling eyes and frenzied cries the women attack, bringing Pentheus down and dragging him to the ground. His mother Agaue, driven mad by Dionysus, proceeds to rip her son to death and returns home with Pentheus's head in her hands.

Cadmus, who knows what has happened, sadly approaches his daughter and Agaue begins to weep. Cadmus remarks that the god has punished the family rightly but excessively. In the end, Dionysus finally appears in his true form to the city. He banishes Agaue from Thebes and ordains that Cadmus and his wife will turn into snakes, destined to invade Greek lands with a horde of barbarians.

Fig 219: Left: Greek bowl illustrating the Bacchae and Lazzarini's Orpheus and the Bacchae. Orpheus is a personification of Dionysus. Right: Memling's "Day of Judgment". While in the Bacchae, despite madness and mayhem, only one person is killed, in the Christian version, failing to recognise Yeshua as the Son of God results in genocidal cosmological catastrophe.

Christianity adopted a fully fledged End of Days, with Jesus claiming in the synoptic gospels and John to challenge the devil in a final confrontation, through which he would come to return in power at the right hand of God. The siege of Jerusalem, the Jewish diaspora and the depravities of the Roman emperors subsequently sublimed this picture in Revelation into a view of world history in which Christ would return as the Lord and conqueror of evil in the Millennium and the effective Day of Judgment. Despite the failure of this entire concept over two millennia in the absence of the Lord's return, the spectre of apocalyptic victory in tumult and conflict remains integral to Christian eschatology.

Also implicating the Hebrew tradition, there are there are forerunners of this, for example in post-exilic Zechariah (520-518 BCE), looking to the restoration of the Temple, which does have an apocalyptic climax, which however ends in pastoral tranquillity, despite the destruction of the enemies:

"And it shall come to pass, that in all the land, saith the Lord, two parts therein shall be cut off and die; but the third shall be left therein. And I will bring the third part through the fire, and will refine them as silver is refined, and will try them as gold is tried: they shall call on my name, and I will hear them: I will say, It is my people: and they shall say, The Lord is my God. ... And his feet shall stand in that day upon the mount of Olives, which is before Jerusalem on the east, and the mount of Olives shall cleave in the midst thereof toward the east and toward the west, and there shall be a very great valley; and half of the mountain shall remove toward the north, and half of it toward the south ... And ye shall flee to the valley of the mountains; ... And it shall come to pass in that day, that the light shall not be clear, nor dark: But it shall be one day which shall be known to the LORD, not day, nor night: but it shall come to pass, that at evening time it shall be light. And it shall be in that day, that living waters shall go out from Jerusalem; half of them toward the former sea, and half of them toward the hinder sea: in summer and in winter shall it be. And the LORD shall be king over all the earth: in that day shall there be one LORD, and his name one. All the land shall be turned as a plain from Geba to Rimmon south of Jerusalem: ... And men shall dwell in it, and there shall be no more utter destruction; but Jerusalem shall be safely inhabited. And this shall be the plague wherewith the LORD will smite all the people that have fought against Jerusalem; Their flesh shall consume away while they stand upon their feet, and their eyes shall consume away in their holes, and their tongue shall consume away in their mouth. ... And it shall come to pass, that every one that is left of all the nations which came against Jerusalem shall even go up from year to year to worship the King, the LORD of hosts, and to keep the feast of tabernacles. ... and in that day there shall be no more the Canaanite in the house of the LORD of hosts." (Zech 13-14).

Similar passages can be found in Isaiah, Micah, Ezekiel and Jeremiah all ending in the peaceful rule of the Lord.

In Daniel, which is believed to have originated as a collection of folktales among the Jewish community in the late 4th to early 3rd centuries BCE, the apocalypse is political in nature, with the "abomination of desolation" identified with Antiochus IV, the king of the Greek Seleucid dynasty, who in 167 BCE, put an end to the practice of a lamb being sacrificed morning and evening, on the altar of the Jewish temple in Jerusalem. The visionary chapters of Daniel, chapters 7-12, are said to have been added to reassure Jews that they would survive in the face of this threat.

In 66 the Jews rose in revolt against the Romans as their ancestors had once done against Antiochus. The resulting First Jewish-Roman War ended in 70 CE when the legions of the Roman general Titus surrounded and eventually captured Jerusalem. The city and the temple were razed to the ground, and the only habitation on the site until the first third of the next century was a Roman military camp. According to Josephus this resulted in over 1.1 million deaths. It was against this background that the gospels were written, Mark around 70 CE and Matthew and Luke around 80–85. Mark harks specifically back to Daniel to validate the Kingdom as a prophecy:

"But when ye shall see the abomination of desolation, spoken of by Daniel the prophet, standing where it ought not, (let him that readeth understand,) then let them that be in Judaea flee to the mountains: ... But in those days, after that tribulation, the sun shall be darkened, and the moon shall not give her light, And the stars of heaven shall fall, and the powers that are in heaven shall be shaken. And then shall they see the Son of man coming in the clouds with great power and glory" (Mark 13:14).

In **Revelation**, ἀποκάλυψις (*apokalypsis*) this world view is taken to its annihilating cosmological extreme in culminating the Christian bible, although it is still not recognised as such by the Orthodox Church. Ironically it is not the latest work. Traditional sources date it to the reign of Domitian (CE 81–96), in the wake of the siege of Jerusalem.

Elaine Pagels (2012) has a detailed insightful analysis, both in terms of a revitalisation of early Christian apocalyptic belief as a result of the tumultuous events of the fall of Jerusalem also highlighting its position in terms of the more Judaic elements of John's vision whom she describes as a "provincial Jewish prophet", which brought him into open conflict with Paul over issues of 'kosher' purity of food, sexual purity noted in Revelation as 'virginity' and sexual relationships with pagan gentiles, in which popularity among the gentiles resulted in a "new religion" emanating from the born-again Paul's influence overtaking the traditions of the Jewish Christians. This gives an insight into how the formative early movements arose from diverse, conflicting positions, generating their own world views, which have

later become 'canonised' into scripture now believed to be cosmological fact by believers, but which started out as intense poetic allegories intended to inspire the followers of visionary leaders, each following their own conception.

However, dangerously for the current era of planetary crisis, Revelation becomes a fully-fledged apocalyptic fantasy of the triage of all life, amid conflict of nations, in which there are cataclysmic life-devastating cosmological phenomena - a great earthquake where the sun becomes black as sackcloth of hair, and the moon like blood, mixing an eclipse of the sun, an eclipse of the moon and an earthquake. The stars of heaven fall to the Earth, the sky recedes like a scroll being rolled up, and every mountain and island is moved out of place.

This takes us straight back to the flat-Earth cosmology of the sabbatical creation. There is no way that the islands and mountains would just move and shake when the stars fall and the sky rolls up. It is a cosmology in frank conflict with the 13 billion year evolution of the universe full of galaxies and the 3 billion year evolution of the diversity of life. This only makes sense as a conscious nightmare vision, and political hyperbole, not a genuine cosmological event. It is the most extraordinary book of eschatological religious vision ever written, bursting with tumultuous battles and cataclysms, from the beasts of belial, to the avenging Lord, amid tumult and destruction, resulting in the triage of all life and impossibly a triage of the Sun, Moon and stars:

"The first angel sounded, and there followed hail and fire mingled with blood, and they were cast upon the earth: and the third part of trees was burnt up, and all green grass was burnt up And the second angel sounded, and as it were a great mountain burning with fire was cast into the sea: And the third part of the creatures which were in the sea, and had life, died; and the third part of the ships were destroyed. ... And the fourth angel sounded, and the third part of the sun was smitten, and the third part of the moon, and the third part of the stars; so as the third part of them was darkened, and the day shone not for a third part of it, and the night likewise. (Rev 8). And the four angels were loosed, which were prepared for an hour, and a day, and a month, and a year, for to slay the third part of men. By these three was the third part of men killed, by the fire, and by the smoke, and by the brimstone, which issued out of their mouths" (Rev 9).

Later we see the pregnant woman clothed with the Sun standing on the Moon, who is an apotheosis of the Queen of Heaven, Inanna-Ishtar but also identified by Christians with Mary. Her boy-child, the warlord-to-come, is attacked by a dragon, and taken up to God, precipitating the war in heaven:

"And there appeared a great wonder in heaven; a woman clothed with the sun, and the moon under her feet, and upon her head a crown of twelve stars: And she being with child cried, travailing in birth, and pained to be delivered. And there appeared another wonder in heaven; and behold a great red dragon, having seven heads and ten horns, and seven crowns upon his heads. And his tail drew the third part of the stars of heaven, and did cast them to the earth: and the dragon stood before the woman which was ready to be delivered, for to devour her child as soon as it was born. And she brought forth a man child, who was to rule all nations with a rod of iron: and her child was caught up unto God, and to his throne" (Rev 12).

Fig 220: The woman clothed with the sun and the dragon (William Blake).

On the other side of the cosmic battle we find the great whore of Babylon, the dark manifestation of the same Inanna-Ishtar Goddess figure:

"I saw a woman sit upon a scarlet coloured beast, full of names of blasphemy, having seven heads and ten horns. And the woman was arrayed in purple and scarlet colour, and decked with gold and precious stones and pearls, having a golden cup in her hand full of abominations and filthiness of her fornication: And upon her forehead was a name written, "mystery, Babylon the great, the mother of harlots and abominations of the Earth". And I saw the woman drunken with the blood of the saints, and with the blood of the martyrs of Jesus: and when I saw her, I wondered with great admiration" (Rev 17).

Pagels (2012) notes the extraordinary time-suspending notion of eternity:

"Then the angel raised his right hand to heaven, and swore by him who lives forever and ever ... There shall be no more time". What use time standing still for eternity is to those in Heaven remains obscure. She further notes that many of the motifs, such as the Leviathan have echoes in some of the oldest Biblical passages that predate Genesis:

"And I saw a beast rising out of the sea, having ten horns and seven heads; and on its horns were ten crowns, and on its heads were blasphemous names. And the beast that I saw was like a leopard, its feet were like a bear's, and its mouth was like a lion's mouth. And the dragon gave it his power and his throne and great authority"

Thus the author of Psalm 74 praises God for having vanquished Leviathan:

“God, my king, is from old, working salvation in the earth. You divided the sea by your might; you broke the heads of the dragons in the waters; you crushed the heads of Leviathan; you gave him as food for the creatures of the wilderness”.

Pagels notes that *“Israel's storytellers, perhaps to reassure their hearers that God's power is uncontested, morphed the sea monster Tiamat into tehom, the Hebrew term for 'the depths', the primordial sea over which they say that 'wind from God' moved in the beginning”.*

The cosmic Christ appears as a feudal dictator-Lord of mass destruction treading the Dionysian winepress of revenge:

“And I saw heaven opened, and behold a white horse; and he that sat upon him was called Faithful and True, and in righteousness he doth judge and make war. His eyes were as a flame of fire, and on his head were many crowns; and he had a name written, that no man knew, but he himself. And he was clothed with a vesture dipped in blood: and his name is called The Word of God. And the armies which were in heaven followed him upon white horses, clothed in fine linen, white and clean. And out of his mouth goeth a sharp sword, that with it he should smite the nations: and he shall rule them with a rod of iron: and he treadeth the winepress of the fierceness and wrath of Almighty God” (Rev 19).

Unmitigated death and destruction is cast on the unbelievers:

“And I saw an angel standing in the sun; and he cried with a loud voice, saying to all the fowls that fly in the midst of heaven, Come and gather yourselves together unto the supper of the great God; That ye may eat the flesh of kings, and the flesh of captains, and the flesh of mighty men, and the flesh of horses, and of them that sit on them, and the flesh of all men, both free and bond, both small and great. ... And the beast was taken, and with him the false prophet that wrought miracles before him, with which he deceived them that had received the mark of the beast, and them that worshipped his image. These both were cast alive into a lake of fire burning with brimstone. ... And the remnant were slain with the sword of him that sat upon the horse, which sword proceeded out of his mouth: and all the fowls were filled with their flesh” (Rev 19).

As gratuitous violence, Revelation reigns supreme as a vision of destructive planetary apocalypse, that is profoundly dangerous, deceptive and misleading – an unmitigated planetary and cosmological disaster. Religious historians cast this in the light of prophetic beliefs in a time of wars of conquest, and particularly the fall of Jerusalem in 66 CE, by heathens over the true followers of God (Pagels 2012) .

However, as long term prophecy to this day and age, it tells of the diabolical violent rule of order of the Lord Son of the God of Creation, over the fecundity of nature, in the complete destruction of Earthly life, cast in the personae of the Great Whore and all the beasts, in which Christianity would move from the wantonly spilled blood of martyrdom, to its adoption as the authoritarian state religion of Rome, and thereby became the religion of dominant empire, leading to the Crusades against another totalitarian religion, albeit in the more compassionate person of Saladin, then the Gnostic Cathars and Albigenses, beliefs spilling out of the Crusades to the Holy Land, through Inquisition and Witch Hunts to the current planetary crises of human exploitation of nature in dominion over it, in climate crisis, the mass extinction of the diversity of life and nuclear mutually assured annihilation, currently being severely tested in the war of Russia on Ukraine, two Orthodox Christian countries. Thus we see a religion of assumed divine order at war with the chaotic fecundity of nature committing a genocide of life amid cosmological conflagration, to achieve the investiture of the avenging Lord of ultimate legislative command, the ultimate Darth Vader of Cosmology, leading to a sandbox replica of the Heavens in a sterile “Holy City” in the sky fashioned through the complete annihilation of the living , in which even the fearful are condemned alongside the murderers:

“But the fearful, and unbelieving, and the abominable, and murderers, and whoremongers, and sorcerers, and idolaters, and all liars, shall have their part in the lake which burneth with fire and brimstone: which is the second death.”

This is a huge tale of human misadventure in pursuing a false destructive ideology of oppressive order. Yet it contains two pivotal elements – the Tree of Life entwined around the throne of the Lamb, giving its Twelve monthly fruit for the healing of the nations – and the notion of the sacred marriage, or hieros gamos. However the sacred marriage is here not that of the true fertility between woman and man as sexual beings that generates the passage of the living generations, but in the corrupted form of the Lamb and the Heavenly Jerusalem, Christ and his Church, falling in the shadow of the dysfunctional marital relationship of Jehovah and the whoring bride Israel, whose ultimate Holy of Holies is sequestered in the metaphor of unrequited love in the Song of Songs:

Let us be glad and rejoice, and give honour to him: for the marriage of the Lamb is come, and his wife hath made herself ready (Rev 19). And I John saw the holy city, new Jerusalem, coming down from God out of heaven, prepared as a bride adorned for her husband. ... And there came unto me one of the seven angels ... and talked with me, saying, Come hither, I will shew thee the bride, the Lamb's wife (Rev 21).

Finally we come to the Tree of Life, hidden since the foundation of the world in Eden, beckoning to our living futures:

And he shewed me a pure river of water of life, clear as crystal, proceeding out of the throne of God and of the Lamb. In the midst of the street of it, and on either side of the river, was there the tree of life, which bare twelve manner of fruits, and yielded her fruit every month: and the leaves of the tree were for the healing of the nations (Rev 21).

Resurrection Revelation A Song after a brush with death, out of which the idea of resplendence arose.

13. The Human Messianic Tradition

Before I left on my millennial sabbatical vigil to the Amazon and Jerusalem, I took a single teaching at the liberal Jewish congregation. When I arrived, the rabbi revealed this was to be on the messiah, and duly expounded that the concept of the Christ, Mashiach or 'anointed one' in the Jewish tradition is a living human being who brings about an epoch or paradigm of long-term future goodness.

Before Yeshua's time there were a progression of messianic anointed, principally kings, in contrast both to the prophetic figures of Old Testament history, who were anointers, or protesters in sack cloth and ashes. Each of Saul, David and Solomon were anointed by a priest and and Cyrus the Mede was acclaimed as anointed in the scriptures (Isiah 45). All of these were clearly and unambiguously human men. Both 'messiah' and 'christ' mean 'anointed' in their respective languages, so the key to being a messiah is being anointed either by a priest, by a woman, or by God 'himself' as in the quotation of Isaiah 61 which Yeshua read in Nazareth "the Lord hath anointed me" and which Jane and I read together as woman and man in the name of God and Gaia on the night of millennium Eve on the Mount of Olives.

Out of the Old Testament anointed, Solomon shines forth in his kingly splendour, in his religious heroism in establishing the first temple, and in his reputation as having a deep knowledge of the natural and supernatural, from the hyssop that grows out of the wall to the key and seal of the magical arts. He was also above all the consort of the feminine, in the Song of Songs, in the Wisdom of Solomon, in the Wisdom of the Proverbs, in giving the Queen of Sheba all she desired, in his many wives and concubines, and his permissiveness, criticised by the Yahwist prophets for letting his many wives worship the strange deities of their own predilection. He is thus a messiah of fertility and abundance, as well as anointed by a high priest in the religious tradition.

In the lead up to Yeshua's mission, there was a growing tradition of Jewish apocalypticism in the shadow of the Zoroastrian renovation cosmology, that led to increasing eschatological expectations of a final end of days confrontation, as articulated in the accounts of prophets such as Zechariah, and in contemporary works such as Enoch and Jubilees. We can also compare Yeshua with contemporaries such as the Essene Teacher of Righteousness, all of whom are regarded by all as human beings. We can compare the cosmic scale of the conflict portrayed between God and Satan surrounding Yeshua's mission with the invectives in the Dead Sea scrolls casting the same kinds of apocalyptic conflict in a more regional and humanly political light in terms of known adversaries. John the Baptist likewise, for all his scorched-Earth apocalyptic rhetoric, is accepted as a human forerunner.

Since Yeshua, in the Jewish tradition, there have been a succession of human messiahs, most or all of which have been a source of lamentation to Jewish people.

A century after Yeshua, Bar Kochba was anointed by Rabbi Akiva⁶⁹ who brought about the final diaspora of the Jewish people in the last futile resistance to the Romans. For his pains, Akiva, was tortured and executed along with nine other prominent Rabbis by the Romans, after revolt of bar Kochba, whose name means "son of a star" following Numbers 'prophecy' 14:7 that "a star shall shoot out of Jacob" died, apparently strangled by a snake after the final battle of Betar. Thus we can see Jesus is not the only one, by any means, anointed, or anointer, to give his life for the cause. Both Yeshua's and bar Kochba's missions can be seen in the Jewish two-messiah model of a Josephic messiah who dies followed by a prophesied Davidic messiah who is victorious. Jesus is Yeshua ben Joseph and died claiming to return in an eschatological parousia disconnecting from the limitations of Jewish descent of traditional law. Great effort nevertheless went into demonstrating his Davidic connection, e.g. with Bethlehem. Later Maimonides expanded

⁶⁹ Akiva (50-135 CE) was instrumental in drawing up the canon of the Tanakh. He stoutly defended the canonicity of the Song of Songs, (as the Holy of Holies) and of Esther, despite it being an allegory of Ishtar. He was executed by the Romans after the Bar Kochba revolt. Akiva said of Bar Kochbah 'This is the King Messiah'. Johanan ben Torta retorted: "Akiva, Grass shall grow from your cheeks and yet the son of David shall not appear".

this concept into a set of almost impossible criteria, including bearing the long lost lineage of David, rebuilding the temple and regathering the diaspora.

The 15th and 16th centuries account several Jewish messiahs, including David Re'uveni and Shlomo Molkho who was burned at the stake. The latter influenced two messiahs from Tsvat in Galilee, Isaac Luria and his successor Hayim Vital.

Luria's new phrasing of the Kabbalistic myth of the Zohar provided for a cosmic rescue mission to be carried out by the messiah and newly endowed the messiah with the ability to determine the nature of the individual soul and human deeds in the effort.

Fig 222: Bar Kochba Kneset Menorah detail and Shabbati Zevi

By far the largest messianic event influencing those to follow and causing continuing ferment and interest internationally was the messiahship of Shabbati Zevi who led a Jewish expedition eastward from Europe but was imprisoned in Turkey and apostatised to Islam. This began

a tradition of duplicitous conversion in which successive messiahs extended the antinomian theme, culminating in Isaac Frank who espoused mysticism and sexual liberation opposed rabbinical teachings and whose daughter become the only female Jewish messiah in his stead. Following this, a line of Hassidic messiahs, begins with Israel ben Eliezer and continues in the messianic following of Menachem Mendel Schneersohn today. The uneven fates and fortunes and angst induced by messianic personalities has in turn led to much pain and a loss of confidence in the messianic persona on the part of Jewish people, faced with both the holocaust and flux and change, both in the New World and in the fortunes of secular Zionism in the 'Holy Land'.

What this parade of messiahs show is that the messianic tradition is one of human innovators and that the elevation of Yeshua to a man-God status is a disconnection from the messianic tradition into pagan beliefs in a super-human hero, characterised more closely by the fertility deities who bridge the realm between the sacred king and the personified god in roles such as Adonis, Tammuz and Dionysus, all of which are human heroes grown into deities associated with death and regeneration, and their projection onto the end of days revelation of the day of judgment, in the son of humanity coming in power, and the personae of Quranic Isa (Jesus/Esau reflecting Nabatean connections) and the mahdi in Shi'ite Islam.

There is a central problem with the idea that God the Father should choose the time and place of Yeshua to pronounce his only begotten son should be sacrificed in a final struggle with Satan to end the dysphoria that began with the mythical Fall in Eden. Why then, over one of many rumblings of civilisation and empire, albeit that of Jerusalem, and not now, since it is now that we have discovered the means of total nuclear annihilation and are laying waste to the planet in a mass extinction on a scale likely to reverberate over evolutionary time scales of millions of years?

The answer lies in social history and the evolution of religious ideas of a God acting in history and the confluence of the Zoroastrian concept of a final renovation with an increasingly apocalyptic Yahwistic following coming out of the Exile, after the subsequent overthrow of Babylon by Cyrus and his favour for the Jews. This confluence came neither from a cosmic God of the universe with a psychopathic jealousy and a tunnel vision for Zion, nor from a local God of history alone, but the collision, ferment and fertilisation of human religious imagination through cultural interaction.

Grillmeier & Bowden (1975) make clear that, central to the christological ideas of Paul are the notion of cosmological pre-existence and the worship of Christ as Kyrios or Lord, no longer a mere messiah, although at fist only implicit in his writing:

*For though there be that are called gods, whether in heaven or in earth, (as there be gods many, and lords many,) But to us there is but one God, the Father, of whom are all things, and we in him; and **one Lord Jesus Christ, by whom are all things, and we by him** (1 Corinth 8:5).*

In Classical Athens, the word *kyrios* referred to the head of the household, who was responsible for his wife, children, and any unmarried female relatives. He deepened existing ideas for the Hellenistic community, composing them into a

universal vision of the history of salvation. The notion of preexistence already had strong roots in Judaism, not only in apocalyptic, but also among the rabbis and in wisdom speculation, in which the messiah is conceived as first in a condition of concealment. Among the rabbis, a pre-existence of the messiah is assumed only as an idea in the thought of God although a real pre-existence of his soul is held.

The Jewish Hellenistic wisdom literature is more important for Paul than apocalyptic and the rabbis. Here, 'wisdom' is extolled as something existing before the world and already working in creation.

The Lord possessed me in the beginning of his way, before his works of old. I was set up from everlasting, from the beginning, or ever the earth was. When there were no depths, I was brought forth; when there were no fountains abounding with water. Before the mountains were settled, before the hills was I brought forth: While as yet he had not made the earth, nor the fields, nor the highest part of the dust of the world. When he prepared the heavens, I was there: when he set a compass upon the face of the depth: When he established the clouds above: when he strengthened the fountains of the deep: When he gave to the sea his decree, that the waters should not pass his commandment: when he appointed the foundations of the earth: Then I was by him, as one brought up with him: and I was daily his delight, rejoicing always before him; Rejoicing in the habitable part of his earth; and my delights were with the sons of men. Now therefore hearken unto me, O ye children: for blessed are they that keep my ways (Prov 8).

The 'rock' that followed, which Philo had already interpreted as wisdom is thus the preexistent Christ:

*Moreover, brethren, I would not that ye should be ignorant, how that **all our fathers were under the cloud**, and all passed through the sea; 10:2 And were all baptized unto Moses in the cloud and in the sea; And did all eat the same spiritual meat; And did all drink the same spiritual drink: **for they drank of that spiritual Rock that followed them: and that Rock was Christ** (1 Corinth 10:1).*

The link with the wisdom teaching is particularly close where Paul and John speak of the work in creation of the pre-existing Logos, now made manifest in Christ:

In the beginning was the Word, and the Word was with God, and the Word was God. He was in the beginning with God. All things were made through him, and without him was not anything made that was made. In him was life, and the life was the light of men (John 1).

We thus end with the hybrid notion of the Trinity, as a contrived Christian cosmological reconstruction, in which the Father pronounces the law, the Son provides salvation, and the Spirit confers eternal life.

We see that the god acting in history, as in the emergence of YHVH as the abstract god of reality, superseding the iconic deities of the nations, becomes reversed and temporally inverted, so that the advent of Jesus, now becomes a man-god, encompassing both human and divine natures, cast back to the cosmic origins as co-eval with God, beginning only subtly and implicitly in the Pauline letters, then exploding into apocalyptic prominence in John and finally Revelation. One looking cynically could see this as a device of Hellenistic Judaism to retrospectively manufacture, in Yeshua's persona, a crafted account that ensures eternal dominance of Christianity, extending its tenure forever, short of an intervening act of God, violating the very notion of the messiah as flesh and blood saviour and the tenure of Christianity as merely a stewardship until Yeshua's return.

This leads to a frank conflict in the messianic tradition between the contrasting personae of the messiah in the end of days, one a foregone Christian cosmic destiny, locked as it is by Paul and then John to Jesus as a Hellenistic-Judaic supernatural avenging Lord, diverging fundamentally from the Jewish mashiach, looking instead to a human saviour of Zion, in repair of the world in long-term future goodness.

James Tabor (1991), who sent me a courtesy copy of "Restoring Abrahamic Faith" in 2010, highlighted the unexpected nature of the shared notion of the Judeo-Christian messiah in the following words:

*"Both Christians and Jews will likely be surprised by the Messiah. In other words, he will probably not conform to anyone's expectations. ... One thing is certain when the Messiah comes, whoever he turns out to be, he will **uphold these essential teachings** of scripture. Can we do anything less?"*

James D. Tabor
February 14, 2010
For Christ, with warmth
but with —
James D. Tabor

These essential teachings are the logos of natural apocalypse in the epoch of Nuclear Holocaust, Climate Crisis and Biospheric Extinction – **Reflowering the Tree of Life, Opening the Gates of Compassion** and the **Hieros Gamos of Holy Reunion**.

14: The Empty Vessel and the Visionary Feast

Anyone who imagines that God is a cosmological reality needs to recognise that, in the diversity of religious beliefs, deity is and has always been a projection of the human imagination onto the universe. We reel with revulsion at the sacrificial excesses of the Aztecs, but this is simply a reflection of Christianity's own sacrificial violence celebrated in the cannibalistic rite of the Eucharist.

Although portrayed by their adherents as vehicles of peace and compassion, religions across the board, throughout history have been founded on social conflict and domination through oppression and violence. Despite attempts at demurral, Joshua committed genocide at Jericho (Josh 6:21) and Hazor (Josh 11:11). Yeshua's own sacrificial death resulted in martyrdom, Crusade and Inquisition. Muhammad ordered a genocide of Jews at Medina (Armstrong 1991 207) and Islam extols conversion by the sword and the death penalty for apostasy. In the Bhagavad Gita, Krishna urges holy war upon Arjuna. Even Buddhism has been wracked with conflicts (Jerryson & Juergenmeyer 2010). If you asked the religions of the world, "Who is without sin?", one by one, beginning with the oldest, they would be convicted by their own conscience, particularly over the women caught in "adultery". The inescapable conclusion is that homicide in Holy War is the "divine" signature of God's ultimate power.

Despite its pretensions to brotherly love and forgiveness and to be the true religion of the only begotten Son of God, Christianity suffers from a rot of confusion at the very core of its being that stems from the very apocalyptic vision it is founded on, compounded later by Hellenistic Judaism. While the Hebrew tradition is a fundamentally covenantal religion of the continuity of life - to be fruitful and multiply, Christianity is a sacramental religion (Ruether 1992) of death and guilt in which the inner sanctum Holy of Holies is the Eucharist - drinking Christ's blood and eating his flesh - the soma and sangre - in remembrance of his crucifixion. This classes Christianity, not just as a religion of human sacrifice like the Aztecs, or cannibalism like the Maori, but one of cosmic deicide - without the shedding of blood there is no remission of sin.

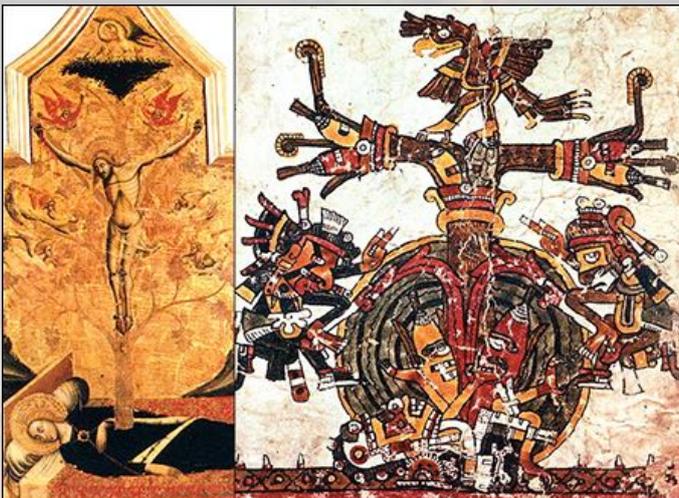

Fig 222b: Christian versus Aztec blood sacrifice. Left: The Dream of Mary (Christoforo Simone dei Crocefissi) Sacrificial blood streams from her Tree of Calvary (the place of the skull). Right: Tree of the Middle Place Blood mother of the corn from the place of the skulls. While Mary dreams of the sacrificed Jesus, the blood mother is sacrificed to the harvest. At the crown of each is a bird - a Christian pelican picking its flesh for blood and a quetzal sometimes holding a snake to symbol regeneration (Campbell). The Aztecs saw great similarities between the Crucifixion and Eucharist and their own forms of human sacrifice.

This comes from the utterly violent fact that Jesus is a figure of primary homicide in a purported crime against the entire universe by the Father, crucified by

the Romans and accused of blasphemy by the High Priests in the enactment of a diabolical ritual sacrifice, including the setting at naught of the sacred king, cursing the women of Jerusalem, and the plaintive cries to El on the cross. But this is only the beginning of the contradiction, because it is Abba himself who has ordained this sacrifice and the sin it is claimed to forgive.

In the Gospels, this is portrayed as a situation whipped up by Jesus, in the conviction that there is an active dark force of evil in the world extending far beyond mere human fallibility, where God and the devil are as complementary as day is to night. The synoptic gospels clearly say that Jesus effectively preordained this violent fate as an orchestrated collision with the devil, who had tempted him to cast himself down from the pinnacles of the temple:

And he brought him to Jerusalem, and set him on a pinnacle of the temple, and said unto him, If thou be the Son of God, cast thyself down from hence: For it is written, He shall give his angels charge over thee, to keep thee: And in their hands they shall bear thee up, lest at any time thou dash thy foot against a stone. And Jesus answering said unto him, It is said, Thou shalt not tempt the Lord thy God (Luke 4).

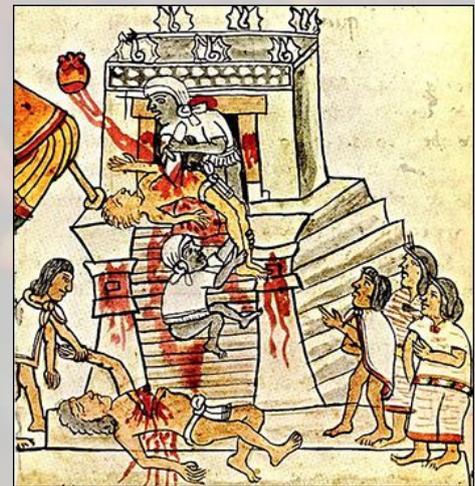

In John, Jesus passes the sop to Judas Iscariot, effectively instructing Judas to betray him to the Romans in a death pact:

When Jesus had thus said, he was troubled in spirit, and testified, and said, Verily, verily, I say unto you, that one of you shall betray me. ... He it is, to whom I shall give a sop, when I have dipped it. And when he had dipped the sop, he gave it to Judas Iscariot, the son of Simon (John 13).

Judas then returns the pieces of silver in a ritual reenactment of Zechariah's apocalypse, although he is effectively carrying out Jesus' instructions for the "Passover Plot" (Schonfield 1965). To take the contradiction to its cosmological conclusion, although the Jews have been blamed and sometimes violently punished by Christians ever since, we are then asked to believe that this entire spectacle is actually God sacrificing his only begotten Son, so all who might believe in him shall have everlasting life in the apocalypse.

This is the tragic flaw in the entire conception. Why would a God of creation that made the scented wildflowers, or the lilies of the field as Jesus said in the Sermon on the Mount, and the dappled forests, and all the creatures that run, swim and fly, and human beings full of a spectrum of emotions, from love to hate, and a stringent desire for personal autonomy, reduce the entire universe to a sacrificial filicide to save humans from the wayward ways, that He had Himself created; to avoid a damnation that He Himself had set in motion? This is a completely flawed cosmology, little better than the Aztecs thinking they had to sacrifice countless men, women and children to keep the Sun on course in the heavens. A God called the loving Father Abba who chooses to have his own son tortured and killed as high noon with the dark forces to redeem us from sin is a Neolithic throwback to blood sacrifice to ensure the fertility of the agricultural harvest. We don't need to invoke death to redeem life. We don't need cosmological homicide to have our sins forgiven. Fertility and birth itself are the antidotes to the mortal condition, not filicide, or human, or transcendental homicide in the name of eternal life.

Fig 222c: Human sacrifice as shown in Codex Tudela. According to the Ramírez Codex, in Tenochtitlan approximately sixty prisoners were sacrificed at the festivities of the war god Huitzilopochtli. For the reconsecration of Great Pyramid of Tenochtitlan in 1487, dedicated to both Tlaloc and Huitzilopochtli, the Aztecs reported that they sacrificed about 20,400 prisoners over the course of four days.

When Cortez arrived with the conquistadores, the Aztecs saw in Christian sacrifice a true reflection of their own sacrificial customs, which in turn enraged the Spaniards, who then embarked on their own unmitigated homicides of believers in native religious and spiritual notions. In Central and South America, "heathen" natives were tortured and burned for crimes against the true faith, such as not believing in it. Mayan scribes in Central America wrote:

Before the coming of the Spaniards, there was no robbery or violence. The Spanish invasion was the beginning of tribute, the beginning of church dues, the beginning of strife." Catholic fathers of the mission of San Francisco burned many Indian "witches" before the tribes were sufficiently subdued to accept God's word. Missionary teams included an inquisitor.

Fig 222d: Early in the conquest the notorious dismemberment and slaughter of Aztec musicians celebrating a heathen festival (Gruzinski).

This also applied to a desperate attempt to obliterate all trace of the divine sacraments of the Americas which did have inestimable visionary sacramental power:

"Sacred mushrooms played such an important part in Aztec life that Indian groups which owed tribute to the Aztec emperor paid it with inebriating mushrooms. One Spanish priest wrote that for the Aztecs, the sacred mushrooms were like the host in the Christian religion: through this bitter nourishment, 'they received their God in communion' ... All that could possibly happen to a person could be seen under the effects of the mushrooms. After the effect wore off, people would consult among themselves and tell each other about their visions" (Dobkin de Rios 1984 143).

When the Spanish arrived in Mexico in the 16th century, they persecuted the priests and practitioners who used the sacred plants in

religious rituals. Whatever the visionary effects that informants attributed to the various hallucinogens, the Christian priests concluded that the devil himself was involved. 'The Spanish, writing about the effects of the mushrooms, always conjured up the devil, but we shall really never know if the Aztecs were seeing anything like the Christian devil. Their visions may indeed have been spirits of their pantheon with whom they were in communication. ... The Spanish, culturally mycophobic to begin with, showed great disgust at seeing these mushrooms in use. In Roman Catholicism, communion with the supernatural is based not upon an individual's revealed knowledge, but rather upon membership in a complex hierarchical structure and faith in its doctrines. ... Moreover, Aztec belief that the powers residing in the plants could be controlled by the user was totally alien to Western thought. 'The Spanish ... were so thorough in their destruction ... that these practices went underground for four centuries. Punished for their alleged superstitions, the Mexicans kept their sacred and magical plants hidden from the conquerors'. (Dobkin de Rios 1984 144-5).

This resulted in the loss of knowledge of the sacred mushroom except for a small following of Mixatec people, whom Gordon Wasson discovered in 1953, through his meeting with Maria Sabina, or the world might have not known that such a tradition still existed.

Fig 222e: Mexican drawing of 16th Century shows three sacred mushrooms, teonanactl – the flesh of the gods – a man eating them and a god behind him, who is speaking through the mushroom.

This saga of violence is not without its irony. The departure of Quetzalcoatl to the east has been suggested to have resulted from the historical overthrow of the Toltec high priest Topiltzin-Quetzalcoatl, whose attempt to replace the warlike incarnation of Quetzalcoatl, Ce Acatl and usher in a new golden age of Tula, supplanting the excesses of human sacrifice with ascetic self-sacrifice and offerings of jade, birds, snakes and butterflies did not suit the vigours of the warrior caste who followed the warrior god Tezcatlipoca, the 'lord of the smoking mirror', supposedly with the clandestine involvement of Coatlique, goddess of the Serpent Skirt.

Fig 222f: Quetzalcoatl in combat with Tezcatlipoca (Gruzinski)

He was thus ritually humiliated and banished from Tula in 987 AD and travelled to the Gulf of Mexico where he was supposed to have immolated himself on a funeral pyre to become Venus, thus symbolizing death and resurrection. There is a striking parallel here with the seasonally dying and resurrecting Dumuzi and the subsequent crucifixion of Christ. This god, that tormented Moctezuma with remorse, is naturally considered the Christ of the pre-Columbian civilisation, a situation which gave the conquering Spaniards significant difficulties to come to terms with, particularly given the conflicts between the central role of the crucifixion and communion as sacrificial bloodshed in Christian destiny and the Aztec excesses of human sacrifice. The 'living sacrament' is in both Aztec history and Christian destiny, an antidote to this bloody sacrifice of empty sacramental visionary potency.

Quetzalcoatl, who had introduced the 55 year calendar of the Mayas to the Toltecs had been prophesied to return to bring in the golden age. Moctezuma had suffered a series of alarming prophecies and portents. Nezahualpilli, the chief of the Texcoco had prophesied that strangers were going to rule the land of Anahuac.

When Moctezuma challenged him in a ritual ball game, the Texcocan came from two down to win. When a 'bird with the mirror head' was caught, Moctezuma saw the reflection of hosts of armed men. Temples were struck by fire and lightning. In all there were six fatal signs. When Cortes appeared in 1519 in the year of 1 Reed (Ce Acatl) the year of Quetzalcoatl's return, he was ironically assumed to be Quetzalcoatl or his incarnation returning from the east, and handed the god's regalia by Moctezuma's emissaries.

Fig 222g: Moctezuma sights the comet: A premonition of the return of Quetzalcoatl (Gruzinski)

14. Ecocrisis, Sexual Reunion and the Tree of Life

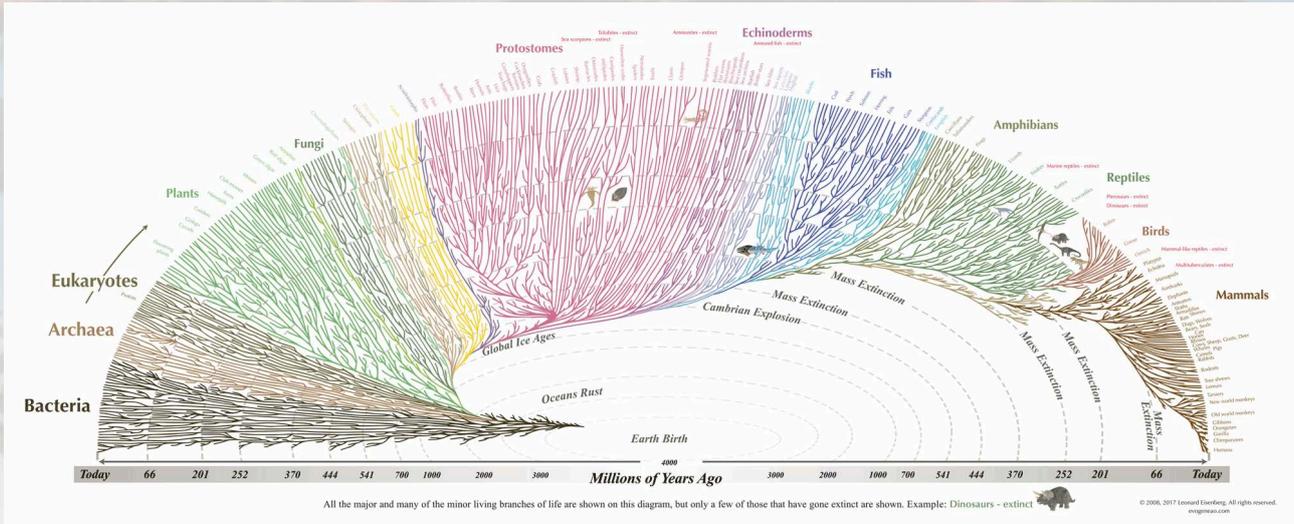

Fig 223: The Evolutionary Tree of Life showing its extreme age noting the mass extinctions which have ravaged it.

The Tree of Life, connecting all forms of creation, and the Tree of Knowledge, connecting to heaven and the underworld, and are both forms of the world tree or cosmic tree, portrayed in diverse religions as the same tree. Uniquely, the Eden origin sets these two trees in opposition withholding the Tree of Life which conferred immortality from Adam and Eve because they had become aware of their sexuality. This is little more than a device of the patriarchy to blame woman for sexual fertility. The seven branched fruiting Tree of Life, as depicted in fig 209 at 2200 BC is far more ancient than Biblical Eden. The life tree has been revered throughout the ancient cultures of the Near East as a symbol of perennial survival, as also noted in fig 225, but underlying this faith is an even more ancient truth going back to our gatherer-hunter origins in the genetic Tree of Life – the immortal Tree of Evolution of living diversity, upon which *Homo sapiens* is utterly dependent as a species, for our food, many of our medicines, for the air we breathe and the balance of the climate and the entire verdant paradise that Earth is capable of being in perpetuity if we don't critically injure it or allow an ill fate to befall it.

But the shoots and whole branches of the Tree are being cast into the fire of mass extinction by human misadventure. This is the most climactic crisis to face humanity in evolutionary time and it is one the traditional religions, despite attempts by some church leaders to address, are tragically ill-equipped to deal with, because the founding presumption of patriarchal monotheism is that nature is a flawed creation of God, doomed by moral sinfulness, that will be discarded in favour of eternal life in Heaven if we believe in Him, but if we do not the fires of Hell await us.

Fig 224: Assyrian Sacred Tree 865 – 860 BC Ashurnasirpal II

There is thus an acute reason, driven by sheer urgent necessity, to address the obstruction Christianity and other patriarchal world religions are causing to the planetary condition and unfold an epoch of planetary resplendence, in which the climax diversity of life can reflower. The planet is genuinely facing an apocalyptic crisis because a combination of business-as-usual exploitation of the Earth's habitat and climate and archaic religions based on

patriarchal religious and moral imperatives, amid scorched-Earth desert eschatologies, is precipitating a mass extinction of the diversity of life which could also result in perpetual human attrition, or our actual extinction, while our only true redemption is to regain the immortal condition life and with it humanity has enjoyed for 3.5 billion years of Earthly Paradise. This is a far more ancient crisis that is foreshadowed in the Fall from Eden, and has emerged with humanity in evolutionary time in the transition from gatherer-hunter existence within nature into urban civilisation and empire in dominion over it, with resulting habitat destruction and potentially irreversible climatic disruption and it can be resolved only by restoring the immortal paradigm of life as a whole.

Christianity is pivotally at fault because it has contrived an eschatology of history to make the planetary future subject to the return of a miraculous man-God whose powers are so extreme over the entire universe as to make it difficult or impossible to correct the fallacy and for any true enlightenment about our actual cosmological condition to prevail.

The status of nature in Christianity has been hotly debated, especially since historian Lynn White published the now classic "The historical roots of present-day ecologic crisis" (1967) in which Christianity is blamed for the modern environmental crisis, which he concludes is largely due to the dominance of Christian world-view in the west which is exploitative of nature in an unsustainable manner. White asserts that Judeo-Christians are anti-ecological, hostile towards nature, imposed a break between human and nature with attitude to exploit the nature in unsustainable way where people stopped thinking of themselves as part of the nature. This exploitative attitude combined with the new technology and industrial revolution wrecked havoc on the ecology. Colonial forestry is a prime example of this destruction of ecology and native faiths.

Although we are each mortal sexual beings, unfolding life is immortal. As a biological species, we are utterly dependent on the genetic and species diversity of life, for our food, for our climate and environment, for our health and medicines and for a sustainable economic future. This is the principle of cosmological symbiosis that the Judeo-Christian notion of dominion over nature stemming from Genesis has instead made a tragedy of the commons (Hardin 1968). But this is not the teachings of Yeshua we find in the Gospel of Thomas (3):

"If those who lead you say to you, 'See, the kingdom is in the sky,' then the birds of the sky will precede you. If they say to you, 'It is in the sea,' then the fish will precede you. Rather, the kingdom is inside of you, and it is outside of you."

Biocrisis and the Patriarchal Imperative

The Fall from Eden echoes in metaphor a descent from Paradisiacal gatherer-hunter existence into the tortured labours of tribal agrarian and shepherding societies. It signals two occluded founding features of our conscious heritage:

- (1) **Cultural Biocrisis:** It declares **the conversion of Paradise into human conflict with nature**, tilling the thorns by the sweat of the brow, dominating nature rather than coexisting with it, and the Tree of Life imprisoned by God to retain his power over mortal knowledge. Likewise in the Sabbatical Creation, humankind is given dominion over nature to subdue it.
- (2) **Patriarchal Oppression:** It confesses in stark terms, **a deep sexual falling out between woman and man** in which the cultural patriarchy (Lerner 1996) has blamed Eve "the mother of all living" (Gen 3.20) for the Fall, by heeding the serpent's claim that the tree of knowledge would make one wise, so **woman was cursed** and made **subservient to her husband**, under **pain of childbirth** and both are **doomed to mortal sexual existence**.

But if this thing be true, and the tokens of virginity be not found for the damsel: Then they shall bring out the damsel to the door of her father's house, and the men of her city shall stone her with stones that she die: because she hath wrought folly in Israel, to play the whore in her father's house: so shalt thou put evil away from among you (Deut 22:20).

If a damsel that is a virgin be betrothed unto an husband, and a man find her in the city, and lie with her; Then ye shall bring them both out unto the gate of that city, and ye shall stone them with stones that they die; the damsel, because she cried not, being in the city; and the man, because he hath humbled his neighbour's wife: so thou shalt put away evil from among you (Deut 22:23).

These questions are fully covered in ensuing sections below and the associated sections on the evolution of humanity, and religion where the emergence of super-intelligence is linked to female reproductive choice in XY-chromosome based mammalian evolution and the severe consequences of the patriarchal dominance emerging 10,000 years ago is discussed as well as the evolution of religion from animism and the social consequences of religious violence, particularly against woman and nature is discussed in full.

Origin Myths, Human Dominion over Nature and Patriarchal Dominion over Woman

Fig 225: The Sabbathal creation is a flat Earth cosmology in which the heavens are beaten domes (firmaments) in which the sun moon and stars are fixed and the plants are created before the heavenly bodies.

In the Sabbathal Creation of Genesis 1 'Elohim creates humanity female and male in their likeness.

On the **first day** "Elohim (God in the male plural) creates Earth from primal chaos (tohu va vohu) and light and darkness by Logos declaration:

In the beginning 'Elohim created the heaven and the earth. And the earth was without form, and void and darkness was upon the face of the deep. And the Spirit of 'Elohim moved upon the face of the waters. And 'Elohim said, Let there be light: and there was light. And 'Elohim called the light Day, and the darkness he called Night. And the evening and the morning were the first day.

The **second day** a firmament (beaten dome) is created called heaven dividing the waters above heaven from the waters below:

And 'Elohim said, Let there be a firmament in the midst of the waters, and let it divide the waters from the waters. And 'Elohim made the firmament, and divided

the waters which were under the firmament from the waters which were above the firmament: and it was so. And 'Elohim called the firmament Heaven. And the evening and the morning were the second day.

The **third day** land and seas are divided and the earthy plants come into being:

And 'Elohim said, Let the waters under the heaven be gathered together unto one place, and let the dry land appear: and it was so. And 'Elohim called the dry land Earth; and the gathering together of the waters called he Seas: and 'Elohim saw that it was good. And 'Elohim said, Let the earth bring forth grass, the herb yielding seed, and the fruit tree yielding fruit after his kind, whose seed is in itself, upon the earth: and it was so. And the evening and the morning were the third day.

The **fourth day**, we find the Sun, Moon and Stars:

And 'Elohim said, Let there be lights in the firmament of the heaven to divide the day from the night; and let them be for signs, and for seasons, and for days, and years: And 'Elohim made two great lights; the greater light to rule the day, and the lesser light to rule the night: he made the stars also. And the evening and the morning were the fourth day.

The **fifth day** we have the creatures of the water and air – fishes and fowls:

And 'Elohim said, Let the waters bring forth abundantly the moving creature that hath life, and fowl that may fly above the earth in the open firmament of heaven. And 'Elohim created great whales, and every living creature that moveth, which the waters brought forth abundantly, after their kind, and every winged fowl after his kind: and 'Elohim saw that it was good. And 'Elohim blessed them, saying, Be fruitful, and multiply, and fill the waters in the seas, and let fowl multiply in the earth. And the evening and the morning were the fifth day.

The **sixth day** is very busy – all the land animals appear, and as if an afterthought, 'Elohim makes humanity male and female in "our likeness", implying the 'Elohim is indeed a male and female divine couple:

And 'Elohim said, Let the earth bring forth the living creature after his kind, cattle, and creeping thing, and beast of the earth after his kind: and it was so. And 'Elohim made the beast of the earth after his kind, and cattle after their kind, and every thing that creepeth upon the earth after his kind: and 'Elohim saw that it was good.

And 'Elohim said, Let us make man in our image, after our likeness: and let them have dominion over the fish of the sea, and over the fowl of the air, and over the cattle, and over all the earth, and over every creeping thing that creepeth upon the earth. So 'Elohim created man in his own image, in the image of 'Elohim created he him; male and female created he them.

Then there is a sting in the tail of paradise, because humanity is given dominion over all living things to replenish and subdue the earth. Humanity has taken subduing nature to heart, but is manifestly failing to replenish it, so the covenant of dominion has been grievously violated. Dominion in the Hebrew radah is that of a benevolent leader, but it is not right for humanity to act as divine regents over the diversity of living nature, our survival lies in being symbiotic guardians of planetary life.

And 'Elohim blessed them, and 'Elohim said unto them, Be fruitful, and multiply, and replenish the earth, and subdue it: and have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth. And 'Elohim said, Behold, I have given you every herb bearing seed, which is upon the face of all the earth, and every tree, in the which is the fruit of a tree yielding seed; to you it shall be for meat. And to every beast of the earth, and to every fowl of the air, and to every thing that creepeth upon the earth, wherein there is life, I have given every green herb for meat: and it was so. And 'Elohim saw every thing that he had made, and, behold, it was very good. And the evening and the morning were the sixth day.

Finally, on the **seventh day**, “Elohim rests on the Sabbath setting up the religious paradigm:

And on the seventh day 'Elohim ended his work which he had made; and he rested on the seventh day from all his work which he had made. And 'Elohim blessed the seventh day, and sanctified it: because that in it he had rested from all his work which 'Elohim created and made.

This is a very beautiful creation myth, founded on the formation of complements, light and dark, waters above and below, day and night, female and male. It teaches that both sexes are in the likeness of the divine and that, while humanity is granted dominion over nature, this is not just to subdue, but to replenish the Earth and its living diversity. Moreover, it is not a literal creation that is any kind of justification to deny natural evolution. There are manifold inconsistencies. The Earth and land plants are incorrectly created before the Sun and Moon and the fishes and birds before earthly fauna. The stars are not fixed in a beaten dome, and the heavens are not a lid on the flat Earth, but outer space filled with galaxies containing billions of suns. Neither are the six days in any way meaningful or the notion of a recent creation some 4000 years ago.

Fig 226: Brothers Limbourg “Garden of Eden”

In the Fall from Eden account Yahweh wanders in the garden from which a mist has watered the Earth. He creates Adam from the dust of the ground, and breathes into his nostrils the breath of life and he becomes a living soul. But then having made Eve from Adam’s rib, Yahweh curses woman for eating the fruit of the Tree of Knowledge and withholds the Tree of Life:

*Unto the woman he said, “**I will greatly multiply thy sorrow and thy conception; in sorrow thou shalt bring forth children; and thy desire shall be to thy husband, and he shall rule over thee**”.*

*And unto Adam he said, “**Because thou hast hearkened unto the voice of thy wife, and hast eaten of the tree, of which I commanded thee, saying, Thou shalt not eat of it: cursed is the ground for thy sake; in sorrow shalt thou eat of it all the days of thy life; Thorns also and thistles shall it bring forth to thee; and thou shalt eat the herb of the field; In the sweat of thy face shalt thou eat bread, till thou return unto the ground; for out of it wast thou taken: for dust thou art, and unto dust shalt thou return**”.*

*And the LORD God said, “Behold, the man is become as one of us, to know good and evil: and now, **lest he put forth his hand, and take also of the tree of life, and eat, and live for ever: Therefore the LORD God sent him forth from the garden of Eden, to till the ground from whence he was taken. So he drove out the man; and he placed at the east of the garden of Eden Cherubims, and a flaming sword which turned every way, to keep the way of the tree of life**”.*

This is also reflected in Jacob imposing patriarchy against the older matrilineal tradition of Laban (Sanday 1981), who notes his kinship with Jacob (29:15). The seven years Jacob spent with Laban for each wife, living with the family of his wives indicates the line of Laban gave “matrilineal” power to the son of the mother over his daughters’ endogamous partners (Gen 30:26), and to his sons (Gen 31:1).

Nancy Jay (1992) notes that moving to the family of the wife is consistent with the injunction in Genesis to “leave your father and mother and cleave unto your wife” and with Jewish marriage practice to go into the wife's tent, resulting in paradoxes of descent in early patriarchal traditions of the tribes of Israel:

“Israelite tradition did not deny descent from women and consequently faced the dilemma: How is a pure and eternal patriline to be maintained if descent from women is not denied? Endogamy appears to be a solution; marriage to a woman of the same patrilineage ensures the offsprings’ patrilineage membership even if it is figured through the mother. Close agnatic endogamy (marriage within the patriline) is extremely rare except in Semitic traditions. In a way reminiscent of the Patriarchs, throughout the Arab world families have preferred men to marry their father’s brother’s daughters. The descent line of the Patriarchs continued only through endogamy: Isaac and Jacob (but not Ishmael) married endogamously. Joseph married exogamously but his sons were adopted by Jacob, correcting this, and other, irregularities of their descent”. ... “for Jacob entangled in the local “matrilineal” scene a sister’s son working for his mother’s brother married uxorilocally and avunculocally to his mother’s brother’s daughter could not escape for twenty years” ... “What is determined by bequeathal of the gods is not title to an inheritance share but, rather, who is to carry on as paterfamilias ... Hence Rachel’s desire to possess the gods of Laban, if it meant anything in this connection, could mean only that she wished Jacob to be recognized as paterfamilias after Laban’s death”.

*“Is there any portion or inheritance left to us? Are we not counted of him strangers?
for he hath sold us, and hath quite devoured also our money.” (Gen 31:14)*

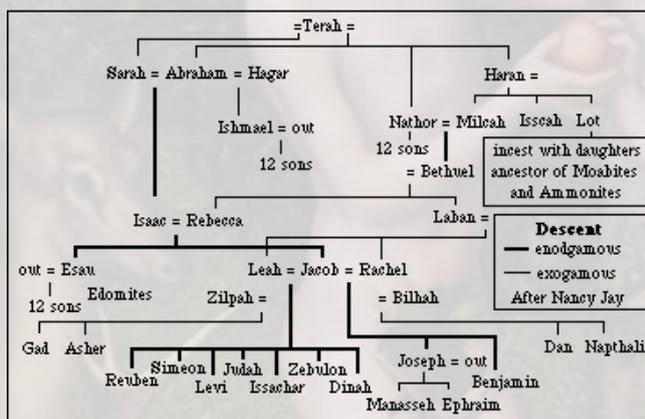

Fig 227: Although the three generations from Abraham to Joseph appear to have covered 700 years of history, making the genealogy of the 12 tribes mythological rather than historical, the peculiar tradition of frequent endogamous marriages which preserve both maternal and paternal lines is consistent with a slow transition from matriarchy (Jay 94). Sarah “queen” or “princess” in Hebrew is portrayed as the concubine of a pharaoh doubling as the sister and secret spouse of Abraham (Gen 12:15), while also his half-sister (Gen 20:12) as is Rebecca with Isaac and a Philistine king (Gen 26:6). Laban is also Rebecca’s brother (Gen 24:29), so Jacob’s marriages to Rachel and Leah are with full cousins.

This was climaxed by Jacob’s precipitate departure, portrayed as abetted by Rachel and Leah, utilising the metaphor of female compliance. As they are leaving, Rachel steals her family teraphim, or house deities. She then hides them under her skirts, to avoid Laban finding them, when they are pursued. The end result is a pointed capture of the older tradition by the Hebrew patriarchy, using Rachel’s menstrual skirts to cement woman’s compliance with the matrilineal overthrow:

*Now Rachel had taken the images, and put them in the camel's furniture, and sat upon them.
And Laban searched all the tent, but found them not. And she said to her father,
Let it not displease my lord that I cannot rise up before thee;
for the custom of women is upon me. And he searched but found not the images (Gen 31:34).*

Conflicting paternal and maternal conceptions can also be made out in the patriarchal blessing of the firstborn, (1) a socio-legal one, which assigned exceptional status to the first male in the paternal line – “the first fruit of vigor” (Gen. 49:3, Deut. 21:17), and (2) a religious one, which assigned special status to the first male issue of the maternal line – “the first issue of the womb” (Ex. 13:2-15, Num. 8:16).

More ancient influences than the biblical can also be seen in the spiritual and religious beliefs of our oldest surviving culture of the San Bushmen, a founding human culture, in genetic, evolutionary and archaeological terms, whose historical presence goes back over 100,000 years and whose ancestor, the mitochondrial Eve is literally the “mother of all living” (Fielder & King 2017). Although over the course of the last two millennia, the San may have had contact with other religious influences, their cosmology and deities have a fresh founding quality, just as engaging as Genesis 1. In addition to their trickster heros and first person experience of the numinous in the trance dance, the Bushmen believe

in the existence of two gods: a greater god manifesting the creative force and a lesser god invoking the malevolent forces of uncertainty and misfortune, each with a shadowy consort, but having little of the moral imperative seen in more recent religious traditions including monotheism.

In “Nisa” (1981) Marjorie Shostak provides an engaging detailed portrait of a !Kung San woman, her sexual relationships with men and her trials of familial life. What emerges from this account is the life of a spirited woman who throughout struggles to maintain her autonomy of choice over her life in a nominally patriarchal society in which the headmen would like to assert a patriarchal imperative, but in which the society has remained remarkably free of the oppressive influences of civilisation succeeding the agricultural revolution which itself was discovered by female gatherers, thus having remarkable similarities to features of sexual relations Western society is only recently re-engaging. We cannot thus assume that history dictates the dominance of patriarchy.

The Origins and Redemption of Religion in the Weltanschauung

Underlying religious history is a deeper evolving substratum of implicit beliefs at a subconscious level that deeply influences and cross-fertilises religious movements. This casts religion, and before religion animism, in a much older setting as a stream of consciousness mind set evoking images of human origins, creation of the universe and the relationship between humanity and the deities we invoke to explain existence.

We can see this in the creation myths across diverse cultures, in the Fall from Eden and in the progression from older belief in Sheol and nature deities into the stark division of Heaven and Hell and traumatic notions of eschatological renovation in the end of days.

Carl Jung has drawn attention to these deeper undercurrents in his concept of the collective unconsciousness:

“In addition to our immediate consciousness, which is of a thoroughly personal nature and which we believe to be the only empirical psyche (even if we tack on the personal unconscious as an appendix), there exists a second psychic system of a collective, universal, and impersonal nature which is identical in all individuals. This collective unconscious does not develop individually but is inherited. It consists of pre-existent forms, the archetypes, which can only become conscious secondarily and which give definite form to certain psychic contents”.

Jung’s view of the collective unconscious comprises in itself the psychic life of our ancestors right back to the earliest beginnings. It is the matrix of all conscious psychic occurrences, which exerts an influence that affects the freedom of consciousness, since it is continually striving to lead all conscious processes back into ancient motifs and experiences. Jung described archetypes as imprints of momentous or frequently recurring situations in the lengthy human past:

“Archetypes are typical modes of apprehension, and wherever we meet with uniform and regularly recurring modes of apprehension we are dealing with an archetype, no matter whether its mythological character is recognized or not”.

Joseph Campbell in turn presented a mythopoetic account of spiritual and religious traditions across cultures in which aspects of Yeshua’s mission, rather than being confined to the Jewish influences, has a wider backdrop in the persona of dying and resurrecting heroes from Adonis, through Tammuz, to Dionysus, sometimes arising as deified leaders. While I don’t personally hold to this view, it appears to have influenced the writers of the canonical gospels and the founding accounts of Yahwistic Genesis.

The entire religious quest is underpinned by the Weltanschauung (James 1868) the deeper world view, that originates from the unique world experience of a people, ensuing over several millennia, also expressed in their language and more anciently in the diverse forms of animism that preceded formal religions. I have underscored the Weltanschauung of Immortality as the founding conscious world view of humans during our emergence, that has now become an urgent quest to redeem humanity from the immanent mass extinction of living diversity. This now becomes the light of resplendence for life as a whole that redeems the apocalyptic tragedy of the religious imperative and enables humanity to find redemption in reflowering the Tree of Life of the evolving biosphere.

Given a planetary condition of environmental apocalypse that is a threat to our own survival and that of the diversity of life as a whole, it becomes essential to look deeply into the collective unconscious for the driving forces. Clearly both religion and business as usual exploitation are driving this, but our knowledge of the natural world remains powerless to address a situation that we all feel disquieted by because it is unable to fathom that nature of consciousness that is central to religious belief. A combination of human tribal motivations that evolved to ensure

human dominance accentuated by archaic religious conceptions whose doctrines have the same intent of ensuring perpetual dominance of religious belief, both by moral imperative and dire penalties, such as death for apostasy means everyone knows the situation is insane but no one knows how, or what to actually do about it.

The one and only way of addressing this is to induce a foundational change in the religious zeitgeist that addresses the root cause hidden behind the religious facade. Symbiotic Existential Cosmology and the Weltanschauung of Immortality provide that hope of a paradigm transformation just like the one that happened at the beginning of Christianity but coupled to the Sacred reunion of woman and man and repositioning the eternal Heaven-Hell divide with the immortal generations of life in Earthly Paradise in the epoch of the Tree of Life. This is the only way a long-term epoch of future goodness can ensue in the religious tradition.

The Cristo Rey Comunicado Rio Madeira, Brazil 1999

Think not that I am come to destroy the law, or the prophets, but to fulfil.

Paradiso and Inferno

Fig 228: el Camino de la muerte descending the Bolivian Andes, daubed with apocalyptic prophesies “Dios te ama, Cristo te Ama, Cristo veine pronto – God loves you, Christ loves you, Christ is coming soon”

I begin this hymn to the regeneration of life in night vigil amid relentless tropical lightning, reclining in a hammock on the Conquista, a river boat to Manaus, in consummation of a **long series of journeys** firstly began far away in the high mountains of the Andes, weaving our way on the precipitous el camino de la muerte, the ancient conquistador road down the Yungas in Bolivia through the burning season in the

dry tropical forest, and then along many rivers from the very source of the Amazon in sedge swamps in the high altiplano, through the alto-Urubamba, past the precipitous peaks surrounding Machu Picchu, the white-water rapids of the Pongo de Mainique, the last wild portal of the Andes, to that anaconda, the muddy, log-strewn Ucayali, winding its way relentlessly north for many days, to become at first the Peruvian Amazon to the junction of the Marañon, amid the lagoons and meanders of the Pacaya and Samiria, to Iquitos accessible only by river, only for the river to become deposited again at the Brazilian Solimões, now ever-larger, sweeping steadily under the hull of the river boat as it cuts its way towards Manaus and the final confluence with the clearer, darker Rio Negro, where the mighty Amazon will finally and unambiguously wind its way unchallenged to the Atlantic Ocean.

Fig 229: Vistas fuego – Fires in the dry tropical forest in the vicinity of Ascension which also had fifty houses burned a month before by raging uncontrolled fires set by hacienda owners.

Of course all the tributaries, from the Mamoré to the Madre de Dios, Mother of God, from the Negro to the Napo, are Amazonas in the integral whole, just as la selva, the forest and its ecological diversity of plants, fungi and animals is the verdant Amazonas - the largest tropical forest on Earth, literally the “lungs of our living planet”, fashioned from over 250 million years ago, as the Andes began to push upward, in a tectonic collision, reversing the westward river flow of the original continental valley that had from time immemorial flowed to the Pacific, to form the world's hugest river basin, as the giant shallow lake spanning almost the whole of the South American continent finally broke through to the Atlantic in the East.

Yet the Amazon is unique neither in its diversity nor in the destruction taking place. The diversity of life is threatened *todo mundo* - the world over from the equator to the poles – by a mass extinction which will haunt human civilisation throughout the rest of our fragile history, unless we can take the steps now to plant the seeds of renewal. Hence this hymn to life.

Fig 230: Vistas negro: The panorama of instant death. The burning of dry tropical forest in Bolivia, September 1999 for hacienda agribusiness development.

The rivers we traverse form an endlessly flowing highway, bordered by thatched villages with their attendant gardens and small plantations, mingling natural harmony with forest destruction, sometimes living closely in cooperation with the natural world, but nevertheless on a vast scale taming and forever changing the face of the forest along every river bank, because of the mass movement of population into the jungle, diminishing or eliminating many keystone species, from the seed-eating fish such as the great paiche to the tall hardwoods, such as the stately mahogany, and with them the many other dimensions of climax forest

diversity, as the secondary growth of a few dominant species lays claim to areas cleared of virgin forest too extensive to regenerate in full diversity for centuries to come.

Fig 231: A village on the Ucayali where our canoe stopped to trade.

Many indigenous peoples have learned how to live in close proximity with nature over countless centuries, without causing massive wholesale destruction, although it is true that the first waves of migration of 'primitive' humankind did cause the demise of many of the America's great land animals. Many village societies today do demonstrate how it is possible to live in cooperation with natural diversity and reap, through nurturing it, the benefits of abundant food, diverse medicines and many natural products which enhance the quality of life both at home and in far-flung urban societies. It is from such village culture that a more compassionate relationship with the natural world already made by many indigenous peoples and can be engaged and celebrated by an enlightened eco-society. It is also possible to have a productive world with genuine abundance for all without wholesale destruction of the world's great wilderness areas, given a fairness of distribution of resources to those in genuine need. Currently, for example, there is up to 50% more food produced world-wide than required to feed every man woman and child, so the real problem is fair distribution, clouded by ownership and property rights, obsession with palm oil plantations and methane-emitting hamburger farms, and who pays the distribution costs.

However, unrestrained developmental forces are encroaching upon the landscape from all directions with an ever accelerating pace of wholesale devastation, which could see the great forest resources of living diversity reduced to a few national parks, comprising only a tenth of their former area, before the end of next century. If this happens, as current rates of felling and burning indicate, two thirds of the living diversity of planet Earth could become extinct by 2100. Much of this drive for extinction is abetted by international financial pressures, but it is also comes from a deep misunderstanding of humanity's relationship with nature, fuelled by personal greed.

Miracle and Paradise: The Rains of Plenty

Fig 232: The Cristo Rey

Our river journey has now taken an unforeseen twist. Upon reaching Manaus, we have decided to turn south up the Rio Madeira towards Porto Velho and the devastation of Rondonia and Acre, by taking the Cristo Rey, which is my very namesake. This will leave open three possibilities to turn East and cross to Rio possibly via the Pantanal, to carry on south up the Rio Madre de Dios - Mother of God and traverse the wild north of Bolivia back into Peru and possibly Manu and to continue on by road to Rio Branco and Xapuri where Chico Mendes was assassinated. As the thunder rolls again and the boat has run aground, turned around and is travelling west. None of us can be sure of the outcome.

If this is the bearer of the logos of reality shouldn't it be accompanied by miraculous portents? Yes and no. To bring off the renewal of the epoch of paradise will be a miracle orders of magnitude beyond anything Jesus himself achieved in his lifetime. On the other hand Jesus himself, was a well-known thaumaturge of the therapeutae. His reputation for miracle thrived on the hypnotic atmosphere of crowd hysteria and evaporated in the harsh light of familiarity as the comments about his performance in his own home town of Nazareth illustrate. Comments ranged from "physician heal thyself" to commenting that he could only perform a few simple healings because of the lack of faith of his compatriots. Faith healing is a common shamanistic skill shared by many famous healers throughout history. As for Yeshua's claimed nature miracles on the waters of Galilee, wait for the lightning to strike.

Fig 233: Lightning strike at Borba

It just did as I spoke. In Borba, a city on the Rio Madeira with a church sporting San Antonio holding a child. Of course lightning strikes with tenacious frequency at sunset, as all rain-makers of the desert know. The Amazon is no exception. We have been besieged by thunder and lightning everywhere we have travelled. Take this as a verdant sign of healing rain if you will. Right now it is spring time and the beginning of the rainy season in the Amazon where we are, just south of the equator. The choice for life's diversity is after all yours.

In the last analysis I am pronouncing this Logos, not because I like or pretend to the role, which is dangerous, despite the fact that it comes as a victorious healing of life rather than the Crucifixion's atonement of death, but simply because I can't fairly depart from this incarnation and return to the cosmic source knowing the Earth is in its unique hour of need culminating the whole of evolutionary time leading up to the 'phenomenon of man' as Teilhard de Chardin put it, that despite the enormity of scientific discovery we are entering the space age adrift, steered like a rudderless ark by irrational forces of economic greed, plunging us into global eco-crisis, through severe lack of foresight, and no respect for the future generations to follow. We all know this situation is insane yet none of us can figure quite what to do about it. We have become disempowered. When one human being can stand and declare the truth of an insane society heading for the precipice of oblivion, it is time to stop and take stock. Judge this communication by its works. Which makes more sense, a world developing towards its own boom and bust decline through institutionalised personal greed, or the vision of the lone ferryman of the Styx, with a tongue like a sharp sword, holding the tiller of fate fast for the Tree of Life?

Central to revisioning the cultural paradigm is regaining our sense of genetic continuity in the evolving of life's diversity, so that conscious vision can unfold throughout our generations over millions of years. The paradigm of the Fall has led to an epoch of dominion over nature, in which the continuity of life has not been respected as a prime cosmological sacred responsibility. The tendency to see God as an agent of order over chaos, and of man over woman, has led to the frank repression of natural diversity in the form of wilderness in superimposing a humanly-devised

manufactured order. It is time to revere nature as sacred, in renewing Earth for the future flowering of all life. There can be no greater celebration. All the generations to follow shall call us blessed and hallow our names for this.

The key affirmations of the logos are very different from the assumptions of traditional religion. They espouse cosmology, sexuality, biology, consciousness, evolution and the preservation of life's diversity over cosmic time in a great flowering of life. They embrace gnostic insight and shamanistic illumination using the visionary power plant sacraments rather than traditional forms of worship. They pronounce liberation from poverty, and from corporate exploitation and from the oppression of moral edict and even the law of order. They unveil the epoch of the Tree of Life in the ending of traditional religion in the renewal of the ethic of true love, sacred marriage of woman and man unrestrained by moral confines. An explosive mixture at critical mass, yet poetic, natural justice in the healing of humanity's cosmic future.

"Tell us what the kingdom of heaven is like.' He said to them, 'It is like a mustard seed. It is the smallest of all seeds. But when it falls on tilled soil, it produces a great plant and becomes a shelter for birds of the sky.'"
Gospel of Thomas

*The Tree Hidden since the Foundation of the World, behind a flaming sword in Eden by a jealous God.
Revealed again by evolutionary science. That Truth is the Tree of Living Diversity,
in whose branches our immortal survival is enshrined, throughout our generations forever.
Cristo Rey Sep 2022*

Revival in Tierra de Vera Cruz

On the Conquista and the Cristo Rey, almost everyone is in the throes of a nascent Christian revival which is blowing in the wind across Latin America. Several of the crew are born again - amicable but committed to spreading the word that Jesus saves. Many people sing religious hymns loudly. Everyone wants to know what denomination you come from. A woman is studiously leafing through "Biblical Apokalypsis" beside me as I write. A more intellectual looking man is reading "Hermenutica". Another young man is poring over a Portuguese comic of the New Testament. Direct simplicity of belief conveyed in Jesus saves, Christ loves you. Christ is coming soon! - Jesu salvae. Cristo te ama. Cristo viene pronto! - as scrawled in white paint on the rock faces of the mountain passes out of La Paz. The question that continues to smoulder in my mind as I move through the Amazonas is "Can this ocean of spiritual belief, the historical endowment of the Western cultural tradition to the Garden, corpus Christianity as a social movement of transformative love, be tapped to seed a renewal of humanity's relationship with nature?" The question remains.

Fig 234: Julio Cañari Alvarado with the Virgin on the Cristo Rey

To those that would decry the intrusion into the ecological arena of an old style religion which has rejected evolution, treats nature as abhorrent and diabolical and opts for a naive divine creation of a universe only a few thousand years old, I reply that where the great gardens of Earth's living diversity lie are also populations following major world religions, that saving life's diversity is not just a scientific or even rational question, because the Earth stands before us much like an artist's palette, that because the Church is a river to her people, infiltrating every town and village far into the jungle, given a wind of change to fulfil the destiny of the Tree of Life, she too can become a flood tide for renewal of life's diversity, by appealing to human altruism and love in a way which science never can on logical grounds alone.

There is no logical or scientific way alone to save the ecology of the planet. Indeed, Bertrand Russel has pointed out that science itself preaches that life is meaningless in a universe of utterly immense violent forces and that only the cosmic heat death awaits those intrepid ones who would venture into the black hole of intellectual honesty. This dilemma of science - that it has no net ethical content - means that science can be used equally for healing our planet's ecology or reducing it to a fragile genetically-engineered nightmare - for every committed ecologist there is an unscrupulous corporate genetic engineer. The choices are creative and have to do with love and inspiration not simply scientific logic.

Although the evolutionary process will be with us as long as there is life on Earth and humanity may pass away through accident or misadventure long beforehand, we have gained such powers to alter the living face of the planet that is its now only through our love and creative vision that the planet will in the short term become whole again. This is a creative process of free choice which goes far beyond the rational and scientific. In so far as love and social justice have a meaning they are also the key to the future of life's diversity. Great social movements, the Christian church included, have a key part to play because they can give people the will, love and ethical commitment to share and protect Earth's living resources for the greater good and for the unfolding of conscious life in the universe at large.

A Millennial World Vigil for the Tree of Life

During a sacred mushroom *velada* in the 1980s, I had a sudden epiphany that, if the world hadn't resolved the world's biodiversity and climate crises by the millennium in 2000, I should make a sabbatical vigil to the Amazon as Earth's natural Eden of tooth and claw and to Yerushalayim as our historical religious nexus point, to pronounce the Sacred Reunion of woman and man under the immortal banner of the Tree of Life, that other tree hidden since the foundation of the world by a flaming sword in Genesis ⁷⁰.

With the world in a state of unmitigated short-term thinking amid bouts of genocidal conflict and no sign of a cohesive agreement to preserve biological diversity, let alone avoid a hard landing caused by human impact and climate change, I managed to secure another academic sabbatical to do a biodiversity field study of human impact in the Amazon in 1999 and to attend a millennial celebration in Jerusalem at the end of the year (King 2017) as appears in Apocalypsia.

The aim was not to evoke an apocalyptic climax, but to make a careful discrete mark in history in a rite of passage declaring that after 2000 years of unfulfilled waiting, the time had come for a true unveiling of the reunion of the female and male sexes of humanity under the immortally perennial banner of the Tree of Life. So we enacted a simple root set of ritual transformations. This is not to fulfil the Christian world view in a second coming, but to make a paradigm shift to an immortally sustainable human future. Scientific discovery has occurred because science has remained open to new theories and ideas which overturn existing assumptions. Key to scientific veracity is the sceptical principle that nothing is proven true until verifiable, in diametrical opposition to religion which is socially addicted to affirmative belief as the pillar of true faith. Archaic religions are urgently in need of a root paradigm shift but place formidable obstacles in the way. Christianity has invested in a miraculous saviour whom no one can unravel because the miraculous construction of the saviour prevents progress under threat of eternal torment or inquisition as a heretic. Islam likewise pronounces death both for apostasy and for any new prophet arising as the Bahai faith shows.

Fig 235: Rock painting with French kiss (Tanum Sweden), rock carving c 10,000 BC Europe , Negev Desert Catal Huyouk: The hieros gamos, leading to progeny. The courtship of the planter queen Inanna and the shepherd king Dumuzi (Wolkenstein and Kramer).

A key feature of the apocalyptic epoch is the fact that, while the Judeo-Christian idea of apocalypse is the expectation of an imminent cosmic cataclysm, in which God destroys the ruling powers of evil and raises the righteous to life in a messianic kingdom, a prophetic revelation, or a great disaster, the true meaning is "unveiling" Gk *apo-* "un" + *kaluptein* "cover", that is a sacred marriage. The entire period has been one of patriarchal domination, in which woman was cursed and social patterns involving the matriarchy and female reproductive choice were violently repressed. We can

⁷⁰ I noticed in writing this that this expression comes from Matt 13:35 claiming Yeshua is revealing his deepest insights, right after Yeshua pronounces the parable of the mustard seed, which is also quoted in Thomas 20. The parable says the Kingdom of Heaven (not the Christian religion) is effectively the seed of the greatest herb, the Tree of Life in whose branches the birds lodge.

thus see that reflowering apocalypse is centrally about the sacred reunion – the ancient *hieros gamos*⁷¹ celebrated since the dawn of time in the fertility of woman and man personified in Goddess and God, leading to fertile offspring.

This is where the balance of human visions of the future come together in a species where sex wars have always been a reality of the asymmetric prisoners' dilemma of our sexes, because of the huge investment of the female in a pregnancy which leaves her vulnerable and travail for months, the potential risks to life of delivering a large head, and years of lactation and early child-rearing. Humans are at an effective extreme of mammals, only 3% of whom are socially (but not in general genetically) monogamous for the same reasons.

Fig 236: Jane anoints Chris with olive oil from Jericho in the old wastes at the Tomb of Lazarus in Bethany and Chris(t) now anointed, kisses her feet and wipes them with his hair. Inset: The remains of the oil 22 years later. We visited Jericho to pronounce the renunciation of genocide in the spirit of sakina in the name of Isa (Esau = the returning Yeshua).

Jane King who partnered with me for the major phase of my sabbatical to the Amazon and to Jerusalem and I were hosted by Yitzhak Hayutman⁷² at the Academy of Jerusalem for a twelve day workshop in the Millennium on the Sacred Reunion and the Tree of Life, in which we discussed the Shekhinah⁷³ the feminine face of Deity manifest on Earth prominent in the Zohar and I gave an evening lecture on biocosmology, the evolutionary tree of life and the need to avoid a hard landing for the biosphere to avoid precipitating a mass extinction of biodiversity, as a fulfilment of the unveiling of reality. The then Director of the School of Mathematics granted my application on the understanding that I would not claim to be walking on water.

Fig 237: The all night gathering on Millennium Eve. Inset: view of the Dome of the Rock from the celebration

On Millennium Eve we hosted an all-night celebration on Mt. Scopus, in a little park overlooking the Dome of the Rock. We had been offered an olive grove next to Gethsemane on the Mount of Olives by a member of the family who originally kept the keys to the Haram-al-Sharif, but we were driven out by a court injunction and police prohibition.

⁷¹ *Hieros gamos* or Hierogamy (Greek ἱερός γάμος, ἱερογαμία "holy marriage") is a sacred marriage that plays out between a god and a goddess, especially when enacted in a symbolic ritual where human participants represent the deities.

⁷² The grandson of one of the founders of Tel Aviv.

⁷³ *shekhinah* שכ"נה "dwelling" or "settling" and denotes the indwelling of the divine presence of God manifest in the tent of Sarah, also linked to ruach ha-kodesh רוח הקודש, the divine influence of God over the universe or living creatures i.e. Holy Spirit.

Jane and I pronounced together our [Anointing Reading](#) for the new epoch of reflowering of the Tree of Life, reciting our Gaian variant of the Messiah's Jubilee passage in Isaiah 61, which Jesus pronounced in the synagogue at Nazareth, pronounced this time as woman and man together as Bride and Bridegroom in the name of God and Gaia:

Fig 238: Jane and Chris pronounce the anointing Millennium Eve.

*The spirit of God is upon us, the spirit of Gaia is within us
because they hath anointed us, to sing good tidings unto the meek
they hath sent us to bind up the broken-hearted,
to proclaim liberty to the captives
and the opening of prison to them that are bound
to proclaim the acceptable year, to comfort all that mourn
to appoint unto them that mourn in Zion
in Palestine, in Sidon, in Syria, Arabia and the world
to give unto them beauty for ashes, the oil of joy for mourning
the garments of love for the spirit of heaviness ...
that they might be called trees of compassion
the planting of the divine, that all might be glorified
in the abundance of wisdom
and we shall renew the old wastes
and we shall restore the former desolations
and we shall repair the waste cities,
the desolations of many generations*

*they hath clothed us with the garments of salvation
and I as a bridegroom decketh myself with ornaments,
and I as a bride adorneth myself with jewels
for as the Earth bringeth forth her bud,
and as the garden causeth the things that are sewn in it to spring forth
so shall harmony and fulfilment spring forth among all the nations
this day is this scripture fulfilled in your ears.*

The vigil was dedicated to the Sacred Reunion in reflowering the Tree of Life in preserving the biosphere and its biological and genetic diversity throughout our future generations. It is the spirit of Gaia and that of God that hath anointed us - the conjoint spiritual insight to perform the act of redemption – not God and Gaia as literal deities. I sang [The Hymn to the Epoch](#), [video](#) followed by a round of dedications from all.

This rite of passage served two key purposes to address foundation issues in the collective unconscious manifest in the Weltanschauung⁷⁴, the archaic formative world view driving patriarchal monotheism expressed in the Yahwistic Genesis **firstly** in Eve being cursed for heeding the serpent, to be obedient to her husband, under pain of childbirth, appeasing male paternity uncertainty, confessing an archaic conflict with the matriliney and female reproductive integrity and **secondly** with dominion over nature in the Tree of Life in Paradise hidden from humanity behind a flaming sword, dooming us to conflict with the thorns of the wilderness in the sweat of human dominance.

*cursed is the ground for thy sake;
in sorrow shalt thou eat of it all the days of thy life;
Thorns also and thistles shall it bring forth to thee;*

This transmission is not a matter of belief but of human realisation in action. This wasn't intended to be a magical pronouncement that would change the world overnight simply by saying it, but a series of rites of passage to dedicate a unique unparalleled event in its time and place, revealing the foresight to take responsibility to speak the words that are key to redeem the apocalyptic tradition in the sustainable epoch of the Tree of Life. The evening was accompanied by folk and harp music, chants to the Shekhinah and recitations from all present to bring in the new epoch, pronounced together "as one is to one" as Devorah Brous, who had coordinated the event stated. Eliyahu MacLean blew the shofar and pronounced the blessing of the collective Mashiach:

*We are here together the collective Mashiach and our vision here tonight will spread
peace in our hearts and peace on the City of Peace below Yeru-shalom Jerusalem.*

⁷⁴ *Weltanschauung* – a particular philosophy or view of life; the world view of an individual or group: *welt* "world" (see world) + *anschauung* "perception" (related to English show). William James (1868)

*and bisrata shem in Jah Allah we'll be as a light and a source for peace
in the whole world and in the whole universe.*

On the Epiphany, we led a small messianic march, of a spontaneous thirteen participants, from the Ascension site on the Mount of Olives, by Gethsemane, the Gates of Compassion ⁷⁵ on the Eastern wall, the Vale of Kidron where the Asherah was removed from the temple and burned in the time of Josiah, to the Western Wall הכּוֹתֵל הַמְּעֵרָבִי.

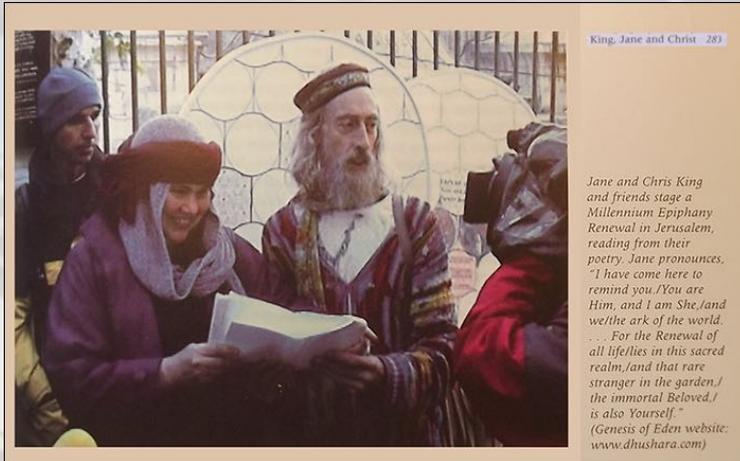

Fig 239: Jane reads the Resurrection of Magdelene Fisher (2002). Inset: Index entry.

This was documented in "Living Religions" (Fisher 2000 283) in the section on Jewish Renewal:

Contemporary Jewish renewal is not just an absence of fear. It is an active search for personal meaning in the ancient rituals and scriptures, and the creation of new rituals for our times. ... From highly conservative to highly liberal quarters, there are now attempts to renew the ancient messianic ideal of Judaism, that by its practice, the world might be healed.

The Resurrection of Magdelene

*I have come here to remind you.
You are Him, and I am She,
and we the ark of the world.
We must not transport to the void
but sweetly plant in Earth, our love so rare
We cannot escape through worship
our own conscious destiny.
Our meeting and our embracing.
For the Renewal of all life
lies in this sacred realm,
and that rare stranger in the garden,
the immortal Beloved, is also Yourself.*

At the gates of Gethsemane we pronounced the Dialogue of the Saviour and Thunder Perfect Mind.

Fig 240: Jane and Chris pronouncing the Gates of Mercy open and the thirteen in the Vale of Kidron.

⁷⁵ Here I prefer shared compassion rather than the theistic implications of mercy: **compassion (n.)** "feeling of sorrow or deep tenderness for one who is suffering or experiencing misfortune," mid-14c., *compassioun*, literally "a suffering with another," from Old French *compassion* "sympathy, pity" (12c.), from Late Latin *compassionem* (nominative *compassio*) "sympathy," from *compati* "to feel pity," from *com* "with, together" + *pati* "to suffer". Latin *compassio* is an ecclesiastical loan-translation of Greek *sympatheia* (see **sympathy**). **mercy (n.)** late 12c., "God's forgiveness of his creatures' offenses," from Old French *mercit, merci* (9c.) "reward, gift; kindness, grace, pity," from Latin *mercedem* (nominative *merces*) "reward, wages, pay, hire" (in Vulgar Latin "favor, pity;" in Medieval Latin "thanks; grace"), from *merx* (genitive *mercis*) "wares, Meaning "disposition to forgive or show compassion" is attested from early 13c.

At the Golden Gates of Compassion in the Eastern wall שלער הזבוי (باب الذهبی) barricaded by the Muslims in the Ottoman period and thought to be the gate through which people would pass in the unveiling), we pronounced them open from Isaiah 60:

*And your gates shall be open continually, they shall not be closed day or night.
The glory of Lebanon shall come to you, the juniper the box tree [fir] and the cypress together.*

Fig 240b: **Jerusalem Panorama**. Centre left the Garden of Gethsemane with a bus outside and above it the Orthodox church with gold leaf onion tops and to the right again the **Jewish cemetery** of the 144,000. Centre right the **Gates of Mercy** (compassion). In the Vale of Kidron, where the Asherah was burned by Josiah, and lower left centre is **Absalom's pillar** and an aqueduct tunnel you can wade through running from there to the **Pool of Siloam**. On Millennium Eve we had been granted the site in the olive grove to the left of Gethsemane to reflower the Tree of Life by the family who had originally held the keys to the Dome of the Rock, but it had to be moved to Mt. Scopus top left, because the authorities refused permission.

According to Jewish tradition, the Shekhinah (שכינה) (Divine Presence – the feminine face of God manifest on Earth) used to appear through the eastern Gate, and will appear again when the Anointed One (Messiah) comes (Ezekiel 44:1–3). I pronounced this passage alone at night in the portico of the gate, as appears in the movie **Apocalypsia**:

*“It is for the prince; the prince, he shall sit in it to eat bread before the LORD;
he shall enter by the way of the porch of that gate, and shall go out by the way of the same.”*

Finally we arrived at the Western (Wailing) Wall, where we pronounced the Sacred Reunion of woman and man, not just God and the bride Israel, but woman and man in the flesh, as the Song of Songs actually declares:

Fig 241: Pronouncing the reunion of woman and man in the Song of Songs which Rabbi Akiva extolled as the Holy of Holies ⁷⁶

*I sleep but my heart waketh:
it is the voice of my beloved that knocketh,
saying open to me my sister,
my love, my dove, my undefiled :
for my head is filled with dew,
and my locks with the drops of the night.
I have put off my coat; how shall I put it on?
I have washed my feet; how shall I defile them?
My beloved put his hand in the hole of the door,
and my bowels were moved for him.
I rose up to open to my beloved
and my hands dropped with myrrh,
and my fingers with sweet-smelling myrrh,
upon the handles of the lock.*

*Set me as a seal upon thine heart, as a seal upon thine arm:
for love is strong as death; jealousy is cruel as the grave:
the coals thereof are coals of fire, which hath a most vehement flame.
Many waters cannot quench love, neither can the floods drown it.*

These core rites of passage – to **unfold the promised epoch of the Tree of Life**, throw open the **Gates of Compassion** and **celebrate the Hieros Gamos of woman and man** in the **Song of Songs**, fulfilled in my subsequent pilgrimage to pay my respects to Kali in Varanasi, completing my academic sabbatical. These are the three core principles of natural redemption that heal the apocalyptic tradition in a true unveiling of the immortal abundance of life.

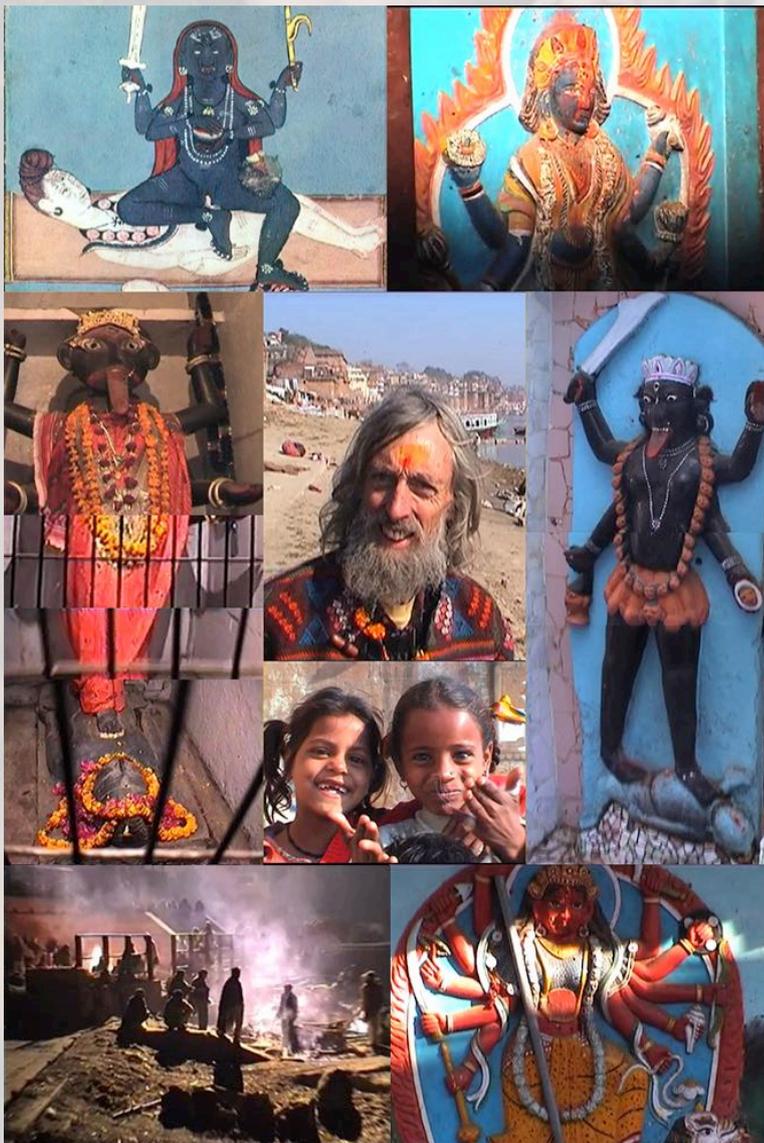

⁷⁶ I have always defended the Song of Songs as the most fertile expression of the Sacred Reunion but for this, a Zionist woman from Tsvat threatened to report me to Mossad as a Gentile “thief in the night”. Our dialogue is recounted in my song **Black Rose** – *video*.

If you imagine for one moment that I was suffering from messianic delusions in the Holy City, here's what happened next! Jane and I had to separate immediately after we pronounced the Sacred Reunion at the Western Wall. Jane flew to the US and I ended up for three days, stranded in Frankfurt airport because my adult son, who I had been flying with earlier on, changed all his bookings, and mine also got cancelled, including my next flight to Delhi to pay my respects to Kali on the Ganga to complete the appointment with fate. Jane and I had parked our little sleeping van in the Frankfurt airport car park and fled to Jerusalem. It was still there with flat tyres and "hundreds" of parking tickets, so I had a place to sleep. After pleading with Lufthansa for three days for a connection to India, they eventually came up with a plan to fly me into Nepal. I had found from the Indian embassy that I could get a 72 hour transit visa at one day's notice in Kathmandu. When I arrived in the evening, the Kathmandu border control seized my passport because I had only a credit card and they wanted \$US cash for the entry visa and then chucked me out of the airport, where there was a huge crowd trying to get in and the doors were locked tight. That meant that, with no passport I couldn't get money, so I had to go to an emergency agency to get a postal visa advance, then next day paid to get my passport back and then finally my treasured 72 hour transit visa, meanwhile visiting yet again the erotic Lakshmi and Durga temples of Kathmandu and the burning ghats of Pashuptinath in the valley opposite Boudhanath. Then down the Himalayan foothills by bus and to the plains of India.

I have had a long affair with Varanasi, that timeless sacred city – a kind of love affair amid the purgatory of existence, as deep as Jerusalem. The first time I was there in 1976, I struck up a personal relationship with a rickshaw driver who made the most desperate genuine pitch. He in turn took me to a wrestler who cared for a traditional Indian house on Kedar Ghat just beside the Golden Temple. I took a medieval room for 2 rupees a night, and had a designated two-foot square cooking area in the galley and a site on the roof where one could sleep in the cool with my padlock key on a string round my neck. The wrestler knew a boatman so I could also go down and sleep on the roof the boats with the

boat builders and listen to the eternal refrains echoing out from the temples and watch the panorama of the bathing ghats at sunrise. I could eat a beautiful vegetable platter at the boatman's house for a few rupees and share the life with his huge family. The wrestler would do regular pujas in the foyer and we would all go up on the roof and smoke opium ghoolies together. There was also ganga at the government ganja shop a little out of town. Each morning there was lemon curd, which you had to get to before the dust and manure and flies took over, served in small bisque-fired clay cups which you smashed ritually to avoid disease.

Fig 242: Chris pays his respects to Kali in Varanasi Jan 2000.

So above is a photo record of my hard won vigil of devotion to Kali as the supremely dangerous Goddess that puts mankind on notice, more extreme than the hapless knight in Chaucer's *Wife of Bath* who had to solve the riddle of "what women want" under pain of death, namely sovereignty. Kali is the archetype of the ancient planter Goddess. You can find her in sacrificial mode in Mohenjo Daro in the Indus valley at 2500 BC alongside Pashupatinath the Shivaic Lord of the Animals complete with his Sadhu trident. I gathered the Kali images from the little alleys I knew by heart that ran behind the bathing ghats to the burning ghats, paying

my respects as Shiva is to Shakti, Durga and Kali in her various forms and for light relief, as Krishna is to the cowgirls, to pay my utmost respects to the founding meditative religious traditions of human culture.

This was deadly serious – as serious as our mutual anointing with olive oil from Jericho at Lazarus's tomb in Bethany. It completed a journey that had taken us through the burning season in Bolivia and all the way from Maccu Pichu, following the Urubamba through the high Andes, then down through the jungle in dugout motor canoes, racing the rapids down to the Pongo de Mainique, the "manic gorge" where the Urubamba cuts through the last of the Andes. The lowland rainforests and mid-montane cloud forests within a radius of five miles of the Pongo possibly comprise the single most biologically-diverse site on the face of the Earth. Then more burning season and down the Ucayali in a banana boat, from Atalaya to Pucallpa, where we took Ayahuasca, with the leprous shaman Snr. Trinico, then the Amazon in river boats in cheap hammocks, with a sojourn in a jungle nature reserve, to Iquitos, then Manaus and south up the Rio Madeira to the Crocodiles and giant storks of the Pantanal.

This was a world vigil that started with the immolation of the tropical forest, our true Garden of Eden in the Amazon, then Reflowered the Tree of Life in Jerusalem and ended up with the immolation of humanity by Kali on the burning ghats of Varanasi. I hope you all understand this devotion to Kali and to the jungle of tooth and claw illuminates the Mount of Olives gathering in a whole new light. And this entire spiritual vigil on an academic sabbatical, for which I was never forgiven by the Dean of Science!

This brings us finally back to the motif of the Tree of Life in the Fall from Eden. The role of religion and of spirituality, ethics and our sense of human conscience is to ensure we collectively cherish and replenish the Earth throughout our generations forever, so that its biological and genetic diversity flourish, its climate remains optimally habitable and all the generations of conscious beings have a full opportunity to experience the mysteries of life and existence. The epoch of the Tree of Life is thus the epoch of sustainability, in which life is able to continue and evolve so long as the Earth shall live. This is the cosmic destiny that human consciousness faces as the guardians of the living planet.

Fig 243: Chris, Heath, Adam and Jane traverse the Andes and Amazon in the Burning Season to document the immolation of biodiversity. Bolivia burning season, Ucayali, Pongo, banana boat, Iquitos, Pantanal.

Although in this celebration effectively everyone was the collective Mashiach, as far as I know, I am the only person in the last 2000 years to correctly identify the culmination of the messianic epoch in the Tree of Life in perennial

immortality of planetary Paradise throughout our generations forever. This is the only epoch of long term future goodness that is relevant or achievable in the universe at large, and which is urgently critical in a planetary crisis of climate and habitat amid an apocalyptic mass extinction of living diversity, likely to harm Paradise for thousands, or millions of years, of extinguish life as we know it, unless we act decisively. It depends on the reunion of woman and man, ending the epoch of patriarchal dominion over woman and nature. To allow this to fail and for Earthly life to be extinguished, since we don't know if life exists elsewhere, could rob the universe of all its manifest meaning.

The responsibility of any *mashiach* in the era of scientific and natural discovery is and has to be to provide verifiable scientific information, veridical collective wisdom and visionary spiritual impetus to enable such a transition to perpetual abundance to become a reality, thus fulfilling the messianic expectation transparently, not as a religious leader, or a miraculous faith healer, but as a research scientist disclosing a cosmology of immortal coexistence.

This transmission is thus also to inform and convey this reality and release responsibility for it freely back to the world, twenty years later, by transparently declaring that the underlying inspiration for the vigil arose from a *velada* on sacred mushrooms, some twenty years before the millennial event. This becomes a visionary process in which we all can participate and seek our own reunion with the cosmos, without relying on a religious leader, or doctrine, or moral imperative, to bind us to the faith, except to have guides and helpers to ensure safe passage in our visionary trips. Thus the epoch of religion (*religio* "to bind together") becomes the epoch of resplendence (*resplendere* "to shine brightly").

Subsequently, when I returned to Aotearoa, in 2003 my partner Christine and I co-authored "Sexual Paradox: Complementarity, Reproductive Conflict and Human Emergence" (Fielder & King 2004) to affirm the reunion of woman and man and of courtship and female reproductive choice, alongside mutual partner choice as a key component of the prisoners' dilemma of our asymmetric sexes, running a Red Queen race of evolution, while standing still, catalysing the emergence of human intelligence and culture. The natural condition is sexual paradox in a game-theoretic edge-of-chaos. This is a climax example of asymmetric symbiosis, which the patriarchy has sought to appropriate in sexual dominion over the female, to our evolutionary disadvantage in future, just as dominion over nature to subdue it without replenishment threatens our very survival.

Dominant patriarchy has been and still is an acutely damaging part of history since the neolithic, that has led to the sequestering, enforced veiling and chaperoning of women, stoning for adultery applied principally to the female "because she didn't cry out", to menstruation becoming regarded as unclean and to diabolical practices of female genital mutilation on behalf of the patriarchy to avoid women enjoying sex and hence being able to make natural reproductive choices. This has in turn led to unremitting expectations by major world religions to increase their following and world domination by reproductive ascendancy.

GAIA & GOD

Eight years before Jane and I went to Jerusalem, in the Millennium, Rosemary Radford Ruether (1991) wrote "Gaia & God", which she described as an "ecofeminist theology of earth healing". Thus one can see in her work a forerunner of what we sought to achieve in pronouncing the reflowering of the Tree of Life in the reunion of woman and man.

"Vessel" Meinrad Craighead 1986 (cover picture)

It's final section entitled "Healing", looks in detail at the covenantal and sacramental aspects of Christian tradition as a potential avenue of sacralising and redeeming nature and the biosphere in a way that, if replicated across cultural and religious traditions could redeem and replenish the living Earth and secure it from human-induced extinction of living diversity. Despite invoking a multiplicity of views both of a transcendent God and a cosmogenic saviour in the person of Christ the overall view she is portraying is one of using religions traditions as human created belief systems to facilitate our integration with nature and our survival as a species and a culture within the closing circle of the biosphere as represented by Gaia as the Matrix of natural cosmological existence. The names

Gaia and God are thus human invoked expressions of wholeness and redemption, not absolute cosmological, or cosmogenic theistic realities.

Healing the World: The Covenantal Tradition

She is clear at the outset both that Christianity and Monotheism more generally are by no means a privileged view of redemption over other paths and traditions and that they remain insufficient as they stand without root change.

In this, and the following chapters, I will explore two lines of the biblical thought and Christian traditions that have reclaimable resources for an ecological spirituality and practice: the covenantal tradition and the sacramental tradition. I want to make clear at the outset what I am not doing in this exploration' I am not assuming that these are the only or, the best religious traditions for ecological ethics and spirituality; and I am not assuming that these traditions can be reclaimed and made usable without change. Both these traditions are marked by a legacy of patriarchy and must and must be reinterpreted if they are to be genuinely affirming of dominated women, men, and nature. Even then the question of whether they can be adequately liberated and made liberating will remain. Nor do I in any way discount that there are resources for ecological spirituality and practice in other traditions, Native American, African, and Pacific indigenous traditions and also Asian spiritualities such as Taoism and Buddhism. All of these many ways should be honored and their resources for ecological spirituality and practice developed.

She immediately notes the development of weapons of mass destruction and in particular nuclear weapons as a turning point in humanity precipitating an apocalyptic destruction of the planet, which requires a new world view as existing traditions are insufficient to address it:

In focusing on these two Christian traditions, I make several presuppositions. First, I assume that there is no ready-made ecological spirituality and ethic in past traditions. The ecological crisis is new to human experience. This does not mean that humans have not devastated their environment before. But as long as populations remained small and human technology weak, these devastations were remediable by migration, retreat from top-heavy urban centers, or adaptation of new techniques. Nature appeared a huge, inexhaustible source of life, and humans small. Only after the bombs of Hiroshima and Nagasaki did humans begin to recognize the possibility that they could destroy the planet by their own expropriated power. The radical nature of this new face of ecological devastation means that all past human traditions are inadequate in the face of it. Whatever useful elements may exist in, for example, Native American or Taoist thought, must be reinterpreted to make them usable in the face of both new scientific knowledge and the destructive power of the technology it has made possible. My second assumption is that each tradition is best explored by those who claim community in that tradition. This does not preclude conversions into other traditions or communication between them. Indeed I believe that we must ultimately draw upon all our spiritual resources in a global community of interrelated spiritual traditions.

She notes both the potential of the Christian tradition, given its size and is problematic defects:

The Christian tradition is one of those communities of accountability that has profoundly valuable themes for ecological spirituality and practice. It also has problematic defects and bears significant responsibility for the legacy of domination of women and nature. But, for that reason, it's liberating potential should not be disregarded. Those too alienated from this tradition to allow it to speak to them have every right to seek other spiritual traditions that can nurture them. But the vast majority of the more than 1 billion Christians of the world can be lured into an ecological consciousness only if they see that it grows in some ways from the soil in which they are planted.

In discussing Hebraic traditions, she claims the Bible has been made to appear to Western Christians to be much more anti-nature than it is by nineteenth-century western European Protestantism, in which "Nature" was understood as subhuman, as the sphere of necessity, and the realm to be negated in order to ascend into humanness and freedom and turns back to the Hebraic view unifying creation and redemption:

The Hebraic understanding of the God of Israel did not set history against nature, but rather experienced God as Lord of heaven and earth, whose power filled all aspects of their lives. The same steadfast love of God is present when God "spread out the earth on the waters, . . . made the great lights," made "the sun to rule over the day, . . . the moon and stars to rule over the night" and when God "brought Israel out from among them. . . with a strong hand and an outstretched arm, . . . divided the Red Sea in two . . . and made Israel pass through the midst of it . . . but overthrew Pharaoh and his army in the Red Sea (Psalm 136:6-1.5). . . Israel experienced both divine judgment and divine blessing in relation to threatening neighbors, and also in relation to storms and droughts. They praised God for deliverance from enemies and for the miracles of fertile fields and starry night skies. In contrast to Greek thought, which saw reality as moving in geometric space, Hebraic thought saw reality as "event."

She notes the problems of the Hebraic tradition, particularly in terms of patriarchy, but suggests this can be surmounted:

The Hebraic view of relationship to God is undoubtedly highly androcentric, anthropocentric, and ethnocentric. God is seen as relating to this particular people through the male leadership of this people. But this does not preclude more inclusive perspectives, a God who also relates lovingly to other people, a God who related directly to women without intermediaries, and a God who relates to nature apart from human mediation.

She then focuses on those passages showing a testimony to a God who relates directly to nature, whether or not it is a nature of benefit to humans. Noting that although the metaphor of God as "maker" is modelled after the artisan shaping artefacts, God is seen as creating a living world, not "dead things":

God is seen as taking profound pleasure in this work of creation, and the creation, in turn, responds to God with praise. God "rejoices" in the world "he" creates, and the planets, mountains, brooks, animals, and plants return this rejoicing in their relation to God. The relation of God and "nature" is often animistically interpersonal. ... Psalm 29 speaks of God present in the storm, whose "voice . . . thunders over many waters," whose thunder "breaks the cedars of Lebanon, . . . makes Lebanon skip like a calf and Siron like a young wild ox." In Psalm 65 God visits the earth in the rain showers, watering its furrows abundantly, blessing its growth. The earth responds with overflowing abundance: "The hills gird themselves with joy the meadows clothe themselves with flocks, the valleys deck themselves with grain, they shout and sing together for joy" (9-1,3).

She notes that the blessing of God's presence is found not only in those spheres of nature under human cultivation, where humans seek benefit from nature. In an extended rebuke to human arrogance, the God who speaks to Job from the whirlwind makes clear that God is equally present in places and times in nature to which humans have no access, noting that the Hebraic texts "social" and "natural" are knit together in one holistic experience:

"Where were you when I laid the foundation of the earth, when the morning stars sang together, and all the heavenly beings shouted for joy? . . . Have you entered into the springs of the sea, or walked in the recesses of the deep?" God also provides for the wild animals not under human control: Can you hunt the prey for the lion or satisfy the appetite of the young lions . . . ? Who provides for the raven its prey when its young ones cry to God . . . ? Do you know when the mountain goats give birth? Do you observe the calving of the deer? . . . Who has let the wild ass go free . . . which I have given the steppe for its home . . . ? It scorns the tumult of the city; it does not hear the shouts of the driver. It ranges the mountains as its pasture. . . . Is it by your wisdom that the hawk soars . . . Is it at your command that the eagle mounts up and makes its nest on high? (Job 38-39)

"He turns rivers into a desert, springs of water into thirsty ground, a fruitful land into a salty waste, because of the wickedness of its inhabitants." At the same time, God can reverse this disaster for the needy: "He turns a desert into pools of water, a parched land into springs of water. And there he lets the hungry live . . . they sow fields and plant vineyards and get a fruitful yield" (Psalm 107:33-36).

She notes that much of the ecological critique of the Bible has focused on the concept of "dominion" over nature granted to "man" by God, disclaiming that the biblical picture is one of keen awareness of the limits of human power and that nature is not private property to be done with as one wishes, but stewardship over an earth that remains ultimately God's:

"The Lord created man out of the earth and turned him back to it again. He gave to men few days, a limited time, but granted them authority over the things upon the earth." (Ecclesiasticus (17:1-2)

She notes that when disaster strikes the righteous man, nature itself teaches him that in this too lies the work of God: *But ask the animals, and they will teach you; the birds of the air, and they will tell you; ask the plants of the earth, and they will teach you; and the fish of the sea will declare to you. Who among all these does not know that the hand of the Lord has done this? In his hand is the life of every living thing and the breath of every human being. (Job 1,2:7-10)*

She notes that one of the major fruits of this Hebraic understanding of the covenantal relationship between justice and prosperity in the land is found in sabbatical legislation, describing the seven-day cycle of the Sabbath, that imitates God's creative pattern in making the world, the seven-year cycle, and the seven-times-seven-year cycle or Jubilee, in each of which, land, animals, and humans are to rest and be re-stored, in deeper and more thoroughgoing ways, culminating in a periodic "permanent revolution" in the fiftieth year.

"Six days you shall do your work, but on the seventh day you shall rest, so that your ox and your donkey may have relief, and your homeborn slave and resident alien may be refreshed" (Exodus 23:1,2). In this cycle the community of Israel imitates God's own creative pattern in making the world, laboring for six days and resting on the seventh.

"For six years you shall sow your land and gather its yield; but the seventh year you shall let it rest and lie fallow, so that the poor of your people may eat; and what they leave the wild animals may eat. You shall do the same with your vineyard and your olive orchard" (Exodus 23:10-11).

"You shall hallow the fiftieth year, and you shall proclaim liberty throughout the land to all its inhabitants" (Leviticus 25:10). In this year everyone who has lost their land through debt will be restored, with each one returning to their former property. The lawgiver accentuates the provisional character of all landholding, since the land remains ultimately God's: "The land shall not be sold in perpetuity, for the land is mine, with me you are but aliens and tenants" (Leviticus 25:23).

She notes that during the Jubilee, Hebrew men and women who have fallen into debt and sold themselves into slavery are to be released, along with their children. Debt too has its limits, and is to be liquidated at the time of the Jubilee, in which healing is guarantee against permanent Hebrew slavery. "

They and their children with them shall go free in the Jubilee year. For to me the people of Israel are servants; they are my servants whom I brought out from the land of Egypt; I am the Lord your God" (Leviticus 25:54-55).

She notes that the Jubilee year is a time of periodic righting of unjust relations, undoing the enslavements of human to humans, the losses and confiscations of land, that have created classes of rich and poor in Israel. The norm of a just community is one of free householders with land equitably apportioned among them, thus providing a model of redemptive eco-justice.

Unlike apocalyptic models of redemption, the Jubilee vision does not promise a "once-for-all" destruction of evil. Humans will drift into unjust relations between each other, they will overwork animals and exploit land. But this drift is not to be allowed to establish itself as a permanent "order." Rather, it is to be recognised as a disorder that must be corrected periodically, so that human society regains its right eco-social relationships and starts afresh. This vision of periodic righting of relationships is also projected on a more absolute messianic future, although still a future within history. This future time will bring a final fulfilment of the covenant of creation, restoring peace between people and healing nature's enmity.

For I am about to create new heavens and a new earth; the former things shall not be remembered or come to mind. But be glad and rejoice forever in what I am creating, for I am about to create Jerusalem as a joy and its people as a delight . . . No more shall the sound of weeping be heard in it or the cry of distress. No more shall there be in it an infant that lives but a few days, or an old person who does not live out a lifetime . . . They shall build houses and inhabit them, they shall plant vineyards and eat their fruit. They shall not build and another inhabit; they shall not plant and another eat; for like the days of a tree shall the days of my people be. Before they call I will answer, while they are yet speaking I will hear. The wolf and the lamb shall feed together, the lion shall eat straw like the ox. But the serpent-its food shall be dust. They shall not hurt or destroy on all my holy mountain, says the Lord. (Isaiah 65 :1,7-22, 24-25).

She further notes that this intimate unity between justice and right relations to nature in the covenantal relation between God and Israel is largely lost in the Christian New Testament, although it appears to be present in the establishment of just relations:

The fullest account of the Lord's Prayer shows an understanding of God's Kingdom as the establishment of justice and right relations on earth. This hope for earthly renewal is spelled out in three terse statements: "Give us this day our daily bread. Forgive us our debts as we also have forgiven our debtors. Do not bring us to the time of trial, but rescue us from evil". (Matthew 6:9-13).

She comments that as Christianity developed, even these concerns for this worldly justice would fade, to be replaced by a cosmological and spiritualised understanding of the work of Jesus as Messiah and the covenantal concepts of relationship to the land would be discarded. Christianity replaced the Jewish ethnic view of peoplehood with a universalist imperial view of God's "new people." It reinterpreted the promised land as the whole cosmos and particularly to "heaven." This meant that the concrete eco-justice perspective of Hebrew law vanished, until close links of Puritan reformers with some forms of militant nationalism revived the ancient connection between an elect nation and its national homeland. In a sermon addressed to the Massachusetts Bay colonists in 1630, while still on shipboard, John Winthrop spelled out the Puritan vision of covenanted commonwealth:

Thus stands the cause of God between God and us. 'Wee are entered into Covenant with him for this worke, we have taken out a Commission, the Lord hath given us leave to draw our owne Articles, . . we have hereupon besought him of favour and blessing. How if the Lord shall please to heare us, and bring us in peace to the place wee desire, then hath hee ratified this Covenant and sealed our Commission and will expect a strickt performance of the Articles contained in it . . .

However, the biblical concept of covenanted people was patriarchal, androcentric, anthropocentric, and ethnocentric. The Puritan revival of this idea in England and in America continued these exclusivist patterns.

The constitutional government constructed by the males of the merchant and planter classes of the thirteen colonies 150 years later would have the same restrictions, with the exception of church membership. All these other groups of people were understood as dependents without autonomous citizenship status. They were presumed to be represented by the collective headship of the male householder. ... In the nineteenth and twentieth centuries, the United States would see a series of reform movements-universal manhood suffrage, abolitionism, women's suffrage, and the civil rights movement-that would seek to redress these limitations. The goal, still not perfectly achieved, has been for equal civil status for all adults, regardless of religion, race, gender, or "previous condition of servitude."

In addressing the covenantal rights of nature, she contrasts environmentalists concerned with rare species extinction and animal rights activists focusing on the rights of animals as individuals:

The interpersonal model of relation to animals is criticized by environmentalists. It means that the category of "animal rights" is extended primarily to certain "favorite" animals, primarily mammals. Some birds, fish, and reptiles may also be included. Insects, which are the vast majority of animal species, do not draw the same response. The traditional line between humans who possess "soul" and animals that do not is extended downward to include categories of animals. But a line is still drawn between a category of beings to be respected on the basis of "sentience," and those who lack sentience and hence lack "rights."

Environmental ethicists, by contrast, are concerned with the health of biotic communities and the maximization of diversity of species within their habitats. Hence they are more concerned about the life of a few insects of an endangered species than they are about the life of the 2 millionth deer in a park where deer are overrunning the carrying capacity of their habitat. This concern for endangered species is often defended on anthropocentric grounds: that each plant or animal species that disappears re moves a potential source of knowledge about the earth that might be valuable for food or medicine. But the value of species goes beyond these utilitarian criteria. Each species of plant or animal is a distinct evolutionary form of life, and thus, as a species, has unique value in its own right. Environmentalists operate from the principle that maximization of diversity of species promotes the health of the whole biotic community. Although natural evolution results in extinction of species over time, the recent human impact on the earth has accelerated this process of extinction in a very dangerous way, and hence humans must assert a role of explicit guardianship over endangered species.

This means close observation of nature, so that we can learn how a healthy biotic community is sustained through complex interchanges of plants and animals implies that we become conscious promoters and restorers of such habitats:

Thus the biblical concept of humans as the "image of God," into whose hands care of nature is given, assumes a more profoundly ethical meaning. Not only does this role of humans give no mandate to destructive use of nature, but it also places a much more comprehensive responsibility for the preservation of nature in human hands. It is the human species that is accountable to the God of life to care for and protect the vast panoply of life forms produced by millennia of earth's creativity. ... But the concerns of animal rights activists should also be heard. There needs to be a place for moral sensitivity to the quality of life of highly sentient animals that most resemble humans in their capacity, not only to feel pain, but also to enjoy life, remember and imagine, and interrelate socially with their own species, as well as with humans.

The sheer numbers of animals used in laboratories far exceeds scientific necessity, and there is no excuse for the cruelty with which these animals are treated. Factory farming necessitates the use of artificial hormones and antibiotics on animals that are cruel to these animals themselves, not to mention their dubious results for the health of humans who consume the meat.

She then comes to the consumptive nub of the problem of the attempt to derive this mandate from "nature" that predation as an unavoidable:

Not only do carnivorous animals depend for their existence on eating other animals, but all life forms exist through an interdependency of consuming and being consumed. Even the bodies of large mammals must eventually decay, providing food for worms and insects. Nor is it sufficient to claim that one does not eat beings with whom one can have an interpersonal relation.

This dilemma is expressed in Genesis 1 that both humans and animals were vegetarians, so meat-eating, and the predator-prey relation of humans and animals, represent a fall into an inferior moral state:

The fear and dread of you shall rest on every animal on earth, and on every bird of the air, on everything that creeps on the ground, and on all the fish of the sea; into your hand they are delivered. Every moving thing that lives shall be food for you, and just as I gave you the green plants [in the original creation], [now] I give you everything. (Genesis 9:2-3)

However vegetarianism stumbles on the fact that a major and group of animals also eat other animals and have key roles necessary for the survival of the biosphere against boom and bust. Do we regard their predation as an expression of "fallen nature"? So the effort to escape from the ambiguity of killing other life in order to live is finally impossible, although there are compelling moral reasons for a mostly vegetarian diet, particularly for affluent people.

But we can hardly impose a vegetarian ethic on third-world peasants for whom the eating of the occasional chicken or pig that grows up in the barnyard is an indispensable part of an otherwise very limited diet. The possibility of having many forms of alternative protein, and hence a healthy diet without meat, is the luxury of the affluent. So it is we of affluent nations, whose supermarkets are filled with a great variety of foods from all over the world, who can and should adopt a near-vegetarian diet for the sake of the rights of both animals and other humans.

A covenantal vision of the relation of humans to other life forms acknowledges the special place of humans in this relationship as caretakers who did not create and do not absolutely own the rest of life, but who are ultimately accountable for its welfare to the true source of life, God as she put it in an identification with burgeoning life as a whole:

This covenantal vision recognizes that humans and other life forms are part of one family, sisters and brothers in one community of interdependence. Although we have limited rights of use of other life forms, and also responsibilities of care and protection toward them, there is an ultimate thouness at the heart of every other living being, whether it be a great mountain lion or swaying bacteria, that declares its otherness from us. The covenantal relation between humans and all other life forms, as one family united by one source of life, forbids this otherness from being translated into destructive hostility. We have no right to wipe out any other life form because it is different from us. But rather, we encounter each other being simultaneously as "other" and as kin, as indeed we encounter each human person. The plant stretching toward the sun, the animal whose eyes warily encounter ours as it pauses in its tasks, reveal their own being in and for themselves.

Healing the World: The Sacramental Tradition

Here, Reuther traces a line of Christian tradition that regards Christ as the cosmic manifestation of God, appearing both as the immanent divine source and ground of creation and its ultimate redemptive healing. Although this cosmological understanding of Christ as both creator and redeemer of the cosmos, is central to much of New Testament thought, she laments that Western Christianity since the late medieval and Reformation periods has ignored this holistic vision. Thus modern searchers for a cosmological spirituality have assumed that this is lacking in Christianity and can only be found in non-Christian perspectives' such as pagan "nature religions" or Asian religions.

Although the cosmological tradition in Christianity needs reinterpretation to be adequate for ecological spirituality, exploring what it would mean to restore for today the cosmological centre of theology and spirituality requires discovering how does this change our understanding of both "God" and "humans"?

Ruether shows how New Testament and early Christian cosmological Christology built on theologies of cosmogenesis in Oriental Hellenism, particularly as these had already been assimilated into Hellenistic Judaism, allowing Christians to assimilate ideas of Hellenistic philosophy, while denying their "pagan" origins. Christian theology thus took over the Hellenistic Jewish apologetic myth that Plato had learned his philosophy from Moses, making Platonism derivative of biblical revelation.

Christianity also took over from Judaism an ideology of religious "purism," over against paganism as "false religion." This dualism still shapes Christian self-understanding, causing it to obscure and deny its actual syncretistic reality. Today this role of Christianity as synthesizer of major Hebraic, Oriental, and Greco-Roman thought should be recognized as a strength, rather than a "secret" to be denied. Certainly Christianity's success as the "winning" religion of late antiquity can hardly be explained apart from this synthesizing process. Today's eco-spiritual crisis demands a synthesizing creativity of even greater expansiveness.

What is called here Oriental Hellenism encompasses both schools of Greek philosophy that had synthesized the Platonic, Stoic, and Peripatetic cosmologies, and also movements that restated this mystical philosophy as "Oriental wisdom," for example, the Chaldean Oracles and the Hermetic literature. Out of this speculative milieu there also emerged the Gnostic literature. But the writings I trace here rejected Gnostic anti-cosmic dualism. Instead they affirmed the cosmos as the expression of immanent divinity within which humans stood as microcosm to macrocosm.

In Middle Platonism the Platonic concept of the transcendent world of Ideas and the Aristotelian concept of the Divine Mind were combined. Also combined were Plato's concept of the World Soul and the Stoic concept of the Logos, which Stoics saw as the immanent life-power of all beings. There thus developed a cosmogonic story with either a two-part or a three-part sequence. Neoplatonism in Plotinus fully develops the three-part sequence.

The cosmos is seen as originating in a transcendent divine being, who is the source of all things. This divine being brings forth from "himself" a perfect "image" and self-expression, in which the intellectual essences of all things are contained. This second God is then also identified with the Demiurgos, who shapes the cosmos from the intellectual "blueprint" contained in "his" own mind. The

world soul, in turn, expresses this divine Logos in immanent form as the sustaining power of the cosmos. Human souls are seen as partaking in the substance of this world soul or immanent Logos of the cosmos.

This cosmogonic picture was used in Jewish Wisdom literature to describe divine Wisdom as a secondary manifestation of the Creator God who is God's agent in creating the universe and is also the immanent power that sustains the universe. Wisdom is understood also as the presence of God speaking in revelation. Through Wisdom human souls come to know God and grow into virtuous "sons" of God.

Philo⁷⁷, the major philosopher of Hellenistic Judaism, developed a more elaborate philosophical theology. He saw God bringing forth a secondary expression, the divine Logos, who is the manifestation of the divine mind. From this Logos radiate the "Dynamis" or energies of God that create the world. The cosmos is sustained by the power of this immanent Logos. Each human soul, in turn, reflects the divine logos. Humans and cosmos thus are seen as "brothers" and parallel "sons of God."

Ruether asserts that in Jewish apocalyptic thought, there had been no identification of the anointed one, Christ, or Messiah with cosmogenesis, even though he was sometimes seen as "preexistent." The Christianity reflected in the synoptic Gospels also lacks this identification, however, when we turn to Paul, the Gospel of John, and the book of Hebrews, this identification of Christ as redeemer with the cosmogonic Logos has been put together into a unified vision of the beginning and the end of "all things":

He is the image of the invisible God, the firstborn of all creation; for in him all things in heaven and on earth were created, things visible and invisible, whether thrones or dominions or rulers or powers—all things have been created through him and for him. He himself is before all things, and in him all things hold together. He is the head of the body, the church; he is the beginning, the firstborn from the dead, so that he might come to have first place in everything. For in him all the fullness of God was pleased to dwell and through him God was pleased to reconcile to himself all things, whether on earth or in heaven, by making peace through the blood of his cross (Colossians 1:15-20).

She notes that the resulting synthesis brings together the twin dramas of creation and redemption in the figure of the Logos-Christ. This one divine being is seen as (1) the manifestation of God, (2) the immanent presence of God that creates and sustains the cosmos, and (3) the divine power re-manifest at the end of time, healing the enmity that has divided the cosmos, reconciling the cosmos to God.

The divine person encountered in Jesus is thereby identified with this Logos-Christ. His redemptive act "through the blood of the cross" is seen as the paradigmatic manifestation of one and the same divine being of the beginning and the end of "all things." As firstborn from the dead and head of the body, the Church. Christ is seen as the power of the new creation, not severed from the cosmos created in the beginning, but the principle through which this cosmos was originally created and now is renewed and reconciled with God. The Church itself is seen cosmologically. It is not simply a group of human believers in this figure, but is the paradigmatic community of the whole renovated cosmos.

She states that the manifestation of the cosmogonic Logos in the end time thus can be understood as a re-incursion of God's primal creative power, subjugating the dissident rebellious angelic powers and thereby bringing about a reunified cosmos, reconciled to God, and filled with God's plenary goodness, as Paul puts it in 1 Corinthians 15:25, "So that God may be all in all." She notes that the effort to unify cosmogony and eschatology in early Christianity was jeopardised by the conflicting strands of Hebrew and Greek thought that they sought to synthesise.

The Hebrew concept of "creation" demanded a cleavage between the being of God and that of created beings, including humans. Jewish thought originally saw humans as essentially mortal. Redemption was a fulfilled, blessed existence on earth within mortal limits, that is, one hundred years.

Greek thought, by contrast, saw the relation of God and cosmos as emanational. There is ontological continuity between God, the Logos of God, and the cosmos. Each of these realities expresses being on different levels of existence. Thus the world soul and the human soul partake in the being of the divine Logos, which manifests the ultimate source of being. But Greek thought also sees the cosmos as split between a higher planetary realm of immortal being and a sublunar world of mortal being. The soul belongs to the

⁷⁷ Philo stated his theology both through the negation of opposed ideas, and through detailed, positive explanations of the nature of God, he contrasted the nature of God with the nature of the physical world. Philo did not consider God similar to heaven, the world, or man; he affirmed a transcendent God without physical features or emotional qualities resembling those of human beings. Following Plato, Philo equates matter to nothingness and sees its effect in fallacy, discord, damage, and decay of things. Only God's existence is certain, no appropriate predicates can be conceived. In Philo, God exists beyond time and space and does not make special interventions into the world because he already encompasses the entire cosmos. Philo also integrated select theology from the rabbinic tradition, including God's sublime transcendence, and man's inability to behold an ineffable God. He argued that God has no attributes (ἀπλοῦς), in consequence no name (ἄρρητος), and for that reason he cannot be perceived by man (ἀκατάληπτος). Further, God cannot change (ἀτρέπτος): He is always the same (ἰδιος). He needs no other being (χρηζει γὰρ οὐδενός τὸ παράπαν), and is self-sufficient (ἑαυτῷ ἰκανός). God can never perish (ἄφθαρτος). He is the simply existent (ὁ ὢν, τὸ ὄν), and has no relations with any other being (τὸ γὰρ ὄν, ἧ ὄν ἐστιν, οὐχὶ τῶν πρὸς τι).

higher realm and has been cast down "unnaturally" into a body. Its task is to escape from the body through turning the mind "upward" and so return at death to disincarnate, immortal blessedness in the stars.

Classical Christianity presented several efforts to unify these disparate world-views. With the Hebrew view, Christianity insisted that humans were a psychophysical union. The body was essential for wholeness of existence, and the resurrection of the body was intrinsic to salvation. Christ must have a real body, not merely an "appearance" of body. Both of these ideas were to cause great difficulty to those imbued with Platonic thought. Patristic Christianity fended off various efforts to deny a bodily incarnation to Christ and the bodily resurrection of both Christ and humanity.

At the same time, Christianity accepted the Platonic prejudice against "becoming." The transience and mortality of material existence was evil. The solution, found already in Paul, is the strange concept of the "spiritual body," a created vehicle of the soul, but stripped of its mortality. This concept of the transfigured body in redeemed life was applied, not only to humans, but to the whole cosmos. Christians shared with Hellenism the view that the whole cosmos was alive, pervaded by dynamic energy that Christianity identified with the immanent Logos of God. Even animals and plants had soul, and the human soul shared with them the animal and vegetative soul. Human psychophysical existence was inseparable from this cosmic whole, within which humans stood as microcosm.

The key difficulty with this very astute account, is that it shows essentially that **Pauline Christianity is a fraudulent concoction of Hellenistic Judaic cosmology, not Jesus' own teachings**, so the religion is a fallacy. A cosmologically contrived divine persona of Christ is overlaid on the person of the historical Jesus, an apocalyptic preacher whose sayings are therefore best understood through the Gospel of Thomas rather than the canonical gospels. As already noted previously, the flesh and blood eucharist was likewise a diabolical "vision" of Paul, later inserted into Mark and the other synoptic gospels. So the true sacrament is that of the living messiah of the Tree of Life's sacred abundance.

She notes that for Irenaeus, creation is itself an incarnation of the Word and Spirit of God, as the ontological ground of bodily existence. The incarnation of the historical Christ is the renewal of this divine power underlying creation. In the incarnation divine power permeates bodily nature in a yet deeper way, so that the bodily becomes the sacramental bearer of the divine, and the divine defies the bodily. The Christian sacraments are paradigmatic of this deeper mingling of body and spirit, renewing the life power of creation, refuting the gnostic negation of the body:

But indeed vain are they who despise the entire dispensation of God and disallow the salvation of the flesh, and treat with contempt its regeneration, maintaining that it is not capable of incorruption. But if this indeed does not attain salvation, then neither did the Lord redeem us with his blood, nor is the cup of the Eucharist the communion of His blood, nor is the bread which we break the communion of His body. For the blood can only come up from the veins and the flesh, and whatsoever else makes up the substance of man, such as the Word of God was actually made . . . And as we are his members, we are also nourished by means of the creation . . . He has acknowledged the cup, which is part of creation, as His own blood, and the bread, which is also part of creation, he has established as His own body, from which he gives increase to our body.

But since salvation has to do with transcending mortality, the only way he can finally think about redemption – not just of the human being, but of the cosmos as a whole – is by assuming that, through being infused by the immortal life of the divine, it will overcome its mortality. This redemption of creation, following the biblical apocalyptic tradition, takes place in two stages. First, there is the millennial blessedness of earthly life. Irenaeus describes the millennium in images drawn from Hebrew prophecy:

Then the whole creation shall, according to God's will, obtain a vast increase, that it might bring forth and sustain fruits, such as Isaiah declares . . . And they shall come and rejoice in Mount Zion, and shall come to what is good, and into a land of wheat and wine and fruits, of animals and of sheep; that their soul shall be as a tree bearing fruit, and they shall hunger no more.

Then the whole cosmos will be transformed into a "new heaven and earth," immortalised, and fully united with the divine life of God. This final union with the Being of God fulfils the promise of the original creation:

And in all these things and by them, the same God the Father is manifested, who fashioned man and gave the promise of the inheritance of the earth to the fathers, who brought forth the creature from bondage at the resurrection of the just and fulfills the promises for the Kingdom of his Son . . . For there is one Son, who accomplished his Father's will, and one human race also in which the mysteries of God are wrought . . . the wisdom of God, by means of which his handiwork, confirmed and incorporated with his Son, is brought to perfection; that is His offspring, the First-begotten Word, should descend to the creature . . . and that it should be contained in Him, and, on the other hand, the creature should contain the Word, and ascend to Him, passing beyond the angels, and be made after the image and likeness of God.

She notes that this effort to incorporate the Hebraic view of earthly blessedness into eternal salvation was dropped by mainline Christianity after the third century, where Christ is then seen as establishing his millennial reign through the political power of the church and Christian rulers, but this has no effect on renewal of nature, nor does it bring forth a new era of justice between humans. Dominant Christianity sees the earth as going downhill toward destruction.

However, the cosmogonic Logos, as the principle of creation, continued in medieval Christianity both Eastern and Western, as the basis of a view of nature as an ontological "ladder" of ascent to God, transmitted to Western Christianity by the writings of Dionysius the Areopagite, perceiving nature as emanational stages of continuous descent from God to angelic hierarchies to humans to animals and plants, rocks, mountains, and rivers is continuous, complemented by the contemplative ascent to God with the contemplation of visible things, moving upward to contemplative union with the being of God.

The Renaissance period also saw a great revival of cosmological mysticism, reinforced by new access to its ancient Hellenistic sources, including Hermetic literature and the Chaldean Oracles, Platonic and Neoplatonic works previously unknown in the West. Revelation in Christ renewed and fulfilled this ancient wisdom, so that the Renaissance reduplicated the ancient chronological error that justified the fusion of biblical and Neoplatonic thought. Then in the early sixteenth century, Copernicus would challenge the ancient geocentric cosmology, making the earth as one planet among others circling the sun.

She notes that the 18th and 19th centuries invoked a stream of philosophical idealism, which sought to bridge the division of mind and matter with a concept of the divine as the unifying source of both thought and physical things. For Spinoza (1632-77), God was *natura naturans*, the underlying substance from which arose the physical world and the human mind (*natura naturata*), as mutual reflections of each other. German idealists Fichte and Schelling also advanced philosophies of Nature that saw God as the unitary Being underlying both thought and physical things, while Hegel sought to bridge spirit and matter through a dialectical process of thesis (spirit), antithesis (material expression), and synthesis (matter-spirit union), which in turn became the new thesis. Those such as Coleridge and Wordsworth, moved toward a more pantheistic communion with deity immanent in nature, engaging more "pagan" modes of thought. In reaction to these trends, Christian theology would seek to establish its "purely biblical" roots by rejecting any presence of God in nature.

She provides a largely positive assessment of Chardin's cosmology with pertinent warnings about its evolution of an elite human culture over the natural realm:

Teilhard de Chardin, whose writings only became available in the late 1950s due to church censorship, used the new insights from evolution to restate the sweeping cosmic vision of salvation history found 1,700 years earlier in Irenaeus. Not just humans, but all of nature is part of this salvation drama. For Teilhard de Chardin, the universe is a total system that ascends in successive systems of organization, from the atomic to the planetary level. This ascent to increasing organizational complexity is also a moral and spiritual ascent, moving toward the unification of consciousness in what Teilhard calls "the Omega Point." The different stages of the evolution of matter, from atomic energy to molecular organization to cellular life to plants and animals and finally humans, are not merely changes of quantitative complexity but are qualitative leaps to new levels of existence.

The universe evolves along the axis of the complexification of matter. Increasingly complex organization of matter increases the internal "radial energy." It is this interior aspect of the complexification of matter that Teilhard sees as responsible for "boiling points" that bring breakthroughs to new levels of existence. There arises from molecular organization the living cell, then increasingly complex organic beings that become more and more aware, and then human self-consciousness. Everything that appears in the process of cosmogenesis is latent from its beginning, but this does not change the reality of its historical birth, which can appear only when a critical level of evolution is reached.

Teilhard's thought would mesh well with the Gaia hypothesis, for he sees the planet earth as a living organism. Earth is one living organism, not only spatially but across time. The planet earth grows through stages of development that are not repeatable, any more than the stages of organic growth from fetus to adult are repeatable. Like an organism, it will also eventually die. The link between geosphere and biosphere is the organic cell, the highest unit of the molecular structure and the simplest unit in the organic structure. The breakthrough to life expresses a new level of centeredness and unification, in which the whole structure becomes an organism participating in a common center and a common life.

For Teilhard, the evolutionary tree has a privileged axis or telos. This telos is toward increasing interiorization and centricity increasing coordination around the directing center of the organism. With vertebrates we arrive at an animal, not held together by an external shell, but from within by a central nervous system. From vertebrates to reptiles to mammals, the nervous system

develops a unifying center in the brain. The increasing size and convolutions of the brain correspond to increasingly intelligent species of mammals, until we arrive at Homo sapiens, in which conscious thought appears.

She comments that in his view For the last 100,000 years, humans have been the privileged axis of evolution, while the animal and plant kingdoms, from which humans arose, diminish. The age of animals is now over, and the earth has become a human earth. That once the level of thought is reached, evolution takes place socially through culture and technology, amid both increasing individuality and collectivity, in which Christian Western history is the privileged axis of cultural evolution. A new stage of modernity is now reaching around the globe, transforming all surviving cultures.

As we have seen, Teilhard sees this new global stage of consciousness and technology as making possible a "noosphere" or world mind that is increasingly unified and centralized. Human minds together increasingly become one unitary Mind, in the evolution of the immanent deity of the cosmic Christ. ... As increasingly collective consciousness develops, finally the organic substratum of the planet will die away, and Unitary Mind will be born from the finite earth into eternal life. The universe will fall away and die after having given birth to God, the ultimate communal consciousness, in which all that has gone before is gathered up and made immortal.

She makes clear that this world picture contains some disturbing elements that need to be rejected. One is the way in which traditional hierarchical order has been "laid on its side," in an evolutionary concept of "progress", together with the confident faith in Western civilisation and modernity as the privileged axis of this progress. Another is the sanguine acceptance of extinction of species as the acceptable price of progress and potentially an acceptance of ethnocidal destruction of other peoples and cultures.

Finally we must question the vision of the material underpinnings of consciousness as being tossed aside in the eschatological, culminating stage of evolution, a conclusion that contradicts the foundational insight of life and consciousness as the interiority of complexified matter. Surely this means that mind and body, the inside and the outside, cannot finally be separated. What is compelling about Teilhard's thought for today is precisely this insight that mind is the interiority of matter, and it is continuous from the simplest molecule to the most complex organism.

She also discusses both the Cosmic Christ of Matthew Fox and Process theology, as developed by Christian theologians such as John Cobb and Marjorie Suchocki from A. N. Whitehead's work, which sees an element of "mentality" present even in the random movements of subatomic particles as does Symbiotic Existential Cosmology. These provide fascinating accounts of the ways modern thinkers try to adapt the notion of God to an understanding of scientific cosmology:

For Fox, original blessing is the intrinsic nature of things. True Christian spirituality remains rooted in this vivid sense of original goodness. Evil is present in history, but as distortion and alienation from original blessing, not as primary reality. Evil can be evaluated as evil only in its negation of primary goodness, which remains our true "nature." Goodness is fundamentally relational. It is the life-giving and celebratory interconnection of all things. Evil is the denial of that interconnection. In "The Coming of the Cosmic Christ", Christ is the immanent Wisdom of God present in the whole cosmos as its principle of interconnected and abundant life.

"Mentality" is a capacity for interaction, which becomes increasingly self-determining and conscious as matter organizes itself at successive layers of organizational complexity. The Primordial Nature of God contains the whole of potentiality of all existing entities at every moment and provides the "initial aim" or best potential option for each entity at each occasion of existence. This "initial aim" embraces the total context of the past of that entity at that moment, and thus is interrelated with all that has been, ultimately, in the whole universe. Each entity has, however, its own subjectivity. It adapts or actualizes this aim of God through actualizing one possibility that can only partially fulfill that aim, and can even thwart that aim in negative choices that are destructive. Thus the God of Process theology "lures" but does not coerce. It offers continual new possibilities, but the choice belongs to existent entities that can negate their own best options. There is freedom and risk in divine creativity, and with this risk, the possibility of evil. This possibility of evil increases as consciousness and power increase on the part of existent entities. Process theologians also postulate that this Consequent Nature of God, reflecting the memory of all that has been, is taken up in some way into the Primordial Nature of God, not only preserving immortally all that has been, but also incorporating it into the total vision of what could and should have been, to reconcile the evils and missed opportunities of history. In this way all that has been is not only remembered in the eternal being of God, but is redeemed as well.

In "**toward an ecofeminist theo-cosmology**", Ruether says ecofeminist theology and spirituality has tended to assume that the "Goddess" we need for ecological well-being is the reverse of the God we have had in the Semitic monotheistic traditions; immanent rather than transcendent, female rather than male identified, relational and interactive rather than dominating, pluriform and multi-centred rather than uniform and mono-centred:

But perhaps we need a more imaginative solution to these traditional oppositions than simply their reversal, something like Nicholas of Cusa's⁷⁸ paradoxical "coincidence of opposites," in which the "absolute maximum" and the "absolute minimum" are the same.

She then cites the huge spread of discovered physical phenomena from the full-scale cosmology of the universe all the way through biological life to the voids of subatomic particles and uncertainties:

At the subatomic level, the classical distinction between matter and energy disappears. Matter is energy moving in defined patterns of relationality. At the level of the "absolute minimum," the appearance of physical "stuff" disappears into a void-like web of relationships, relationships in which the whole universe is finally interconnected and in which the observer also stands as part of the process. We cannot observe anything "objectively," for the very act of observation affects what we observe. ... Thus what we have traditionally called "God" the "mind," or rational pattern holding all things together, and what we have called "matter," the "ground" of physical objects, come together. The disintegration of the many into infinitely small "bits," and the One, or unifying whole that connects all things together, coincide.

As humans stand peering down through their instruments into the subatomic realm and outward into the galaxies, it cannot but be evident that, for us, the human remains the "mean" or mediator between the worlds. This is so because what we perceive can only be known and evaluated from the context of our own standpoints. But also because we are faced with the recognition that humans alone, amid all the earth creatures and on all the planets of these vast galaxies, are capable of reflective consciousness. We are, in that sense, the "mind" of the universe, the place where the universe becomes conscious of itself.

Reflective consciousness is both our privilege and our danger. At least for the last several thousand years of cultural history, male ruling-class humans have used this privilege of mind to set themselves apart from nature and over dominated women and men. Thereby they denied the web of relationships that bind us all together, and within which these males themselves are an utterly dependent part. The urgent task of ecological culture is to convert human consciousness to the earth, so that we can use our minds to understand the web of life and to live in that web of life as sustainers, rather than destroyers, of it.

She notes that there are other forms of consciousness present in other species, sometimes with capacities that humans lack, as in fish that can hear ranges of sound or animals that can see ranges of light not possible to our ears and eyes. Nor can we simply draw a line between us, together with large-brained mammals, and other beings including plants and some complex molecular systems.

Human consciousness, then, should not be what utterly separates us from the rest of "nature." Rather, consciousness is where this dance of energy organizes itself in increasingly unified ways until it reflects back on itself in self-awareness. Consciousness is and must be where we recognize our kinship with all other beings. The dancing void from which the tiniest energy events of atomic structures flicker in and out of existence and self-aware thought are kin along a continuum of organized life-energy. ... Our capacity for consciousness is sustained by a complex but fragile organism. Cut that organism at its vital centers, in the brain or in the heart, and the light of consciousness goes out, and with it our "self."

She reminds us that as biological beings, the immortal self has to be let go of, in oneness with the matrix of all natural existence:

It is this juxtaposition of the capacity of consciousness to roam through space and time, and its utter transience in its dependence on our mortal organisms, that has generated much of the energy of what has been called "religion" in the past. Much of this religious quest has sought to resolve this contradiction by denying it, imagining that consciousness was not really dependent on the mortal organism. The mental self could survive, and even be "purified" and strengthened, by the demise of the body. This concept of the "immortal self," survivable apart from our particular transient organism, must be recognized, not only as untenable, but as the source of much destructive behavior toward the earth and other humans.

An ecological spirituality needs to be built on three premises: the transience of selves, the living interdependency of all things, and the value of the personal in communion. Many spiritual traditions have emphasized the need to "let go of the ego," but in ways that diminished the value of the person, undercutting particularly those, like women, who scarcely have been allowed individuated personhood at all. We need to "let go of the ego" in a different sense. We are called to affirm the integrity of our personal center of being, in mutuality with the personal centers of all other beings across species and, at the same time, accept the transience of these

⁷⁸ In 1453, on his way home from Constantinople where he had gone with the hope of reuniting Eastern and Western Christendom, Cusanus claimed to have had a mystical vision in which he conceived of the "least imperfect" name for God: the *coincidentia oppositorum* or "coincidence of opposites." Unlike most of the Christian theologians of his time who held a monotheistic vision of God as a supernal power that exists independent of the physical world of existence, Cusanus stood out as a controversial figure because of his belief that God does not exist separately from Creation, but rather is both transcendent of and immanent within it – a simultaneous unfolding of Oneness into multiplicity and the enfolding of multiplicity within the One. The *coincidentia oppositorum* was not a description of God, Cusanus insisted, but an explanation of how God works. Because God is infinite and absolute, all things in existence are aspects of God, without which God would not be adequately represented. It was the inability to accept all forms of religious worship as a necessary reflection of God that was the cause of humanity's most devastating conflicts. He felt certain that if people were educated to the truth of this idea, humanity would recognize its ultimate unity, and there would be perpetual peace.

personal selves. As we accept both the value and the transience of the self, we can also be awakened to a new sense of kinship with all other organisms. Like humans, the animals and the plants are living centers of organic life who exist for a season. Then each of our roots shrivels, the organic structures that sustain our life fail, and we die. The cutting of the life center also means that our bodies disintegrate into organic matter, to enter the cycle of decomposition and recomposition as other entities.

She declares that compassion for all living beings becomes the key to being one with the Matrix of Life:

Compassion for all living things fills our spirits, breaking down the illusion of otherness. At this moment we can encounter the matrix of energy of the universe that sustains the dissolution and recomposition of matter as also a heart that knows us even as we are known. Surely if we are kin to all things and offspring of the universe, then what has flowered in us as consciousness must also be reflected in that universe as well, in the ongoing creative Matrix of the whole. As we gaze into the void of our future extinguished self and dissolving substance, we encounter there the wellspring of life and creativity from which all things have sprung and into which they return, only to well up again in new forms. But we also know this as the great Thou, the personal center of the universal process, with which all the small centers of personal being dialogue in the conversation that continually creates and recreates the world. The small selves and the Great Self are finally one, for as She bodies forth in us, all the beings respond in the bodying forth of their diverse creative work that makes the world. ... Then, like bread tossed on the water, we can be confident that our creative work will be nourishing to the community of life, even as we relinquish our small self back into the great Self. Our final gesture, as we surrender ourselves into the Matrix of life, then can become a prayer of ultimate trust: "Mother, into your hands I commend my spirit. Use me as you will in your infinite creativity."

In **Creating a Healed World: Spirituality and Politics**, she evokes a sweeping prophetic review of what needs to be done to redeem the natural biosphere of the planet, including everything from reducing dependence on meat eating, disposable plastic technology, addressing over-population through both voluntary and social measures fearing that the entire ecofeminist environmental agenda will be for naught if the world population rises to 8 billion:

If human population is allowed-to double once again in forty years or less, and hits 8 billion to 10 billion in the first third of the twenty-first century all the measures we have just discussed will go for naught. Humanity has no real alternative to population control. The question is, do we want population control to happen voluntarily, before conception or violently by war, famine, and disease?

In her view, despite expressing both God and the saviour in cosmogenic terms in Christian tradition, her own view of deity in fusing God and Gaia into one arrives at a more a social concept of God and Gaia as human-generated concepts invoking the potentiality for good within us to flower in protection of the natural world without accepting a binary concept of deity transcendent over humanity and nature:

In these two traditions, covenantal and sacramental, we hear two voices of divinity from nature. One speaks from the mountaintops in the thunderous masculine tones of "thou shalt" and "thou shalt not." It is the voice of power and law but speaking (at its most authentic) on behalf of the weak, as a mandate to protect the powerless and to restrain the power of the mighty. There is another voice, one that speaks from the intimate heart of matter. It has long been silenced by the masculine voice, but today is finding again her own voice. This is the voice of Gaia. Her voice does not translate into laws or intellectual knowledge, but beckons us into communion.

Both of these voices, of God and of Gaia, are our own voices. We need to claim them as our own, not in the sense that there is "nothing" out there, but in the sense that what is "out there" can only be experienced by us through the lenses of human existence.

Out of this diverse stream of crisis concerns and wise recommendations, I will let her speak for herself on the critical question of patriarchy through the eyes of a religious ecofeminist:

Patriarchy has multiple impacts on reproductive patterns. Its valuing of the male over the female means that families cannot rest content with having produced two children, if both of these children are female. Often two males are desired to assure the patrilineage. Patriarchy also denies women control over their own sexuality and reproduction, and values women only to produce children, sharply curtailing other ways in which women can live satisfying lives and be held in esteem by their communities.

The empowerment of women as moral agents of their own sexuality and reproduction is thus an integral part of any authentic population policy. The female child needs to be valued equally with the male. This is only possible if the adult female is also seen as an autonomous person who will be an active cultural and economic agent in her own right, and not just an adjunct to a male-centered society. Only when women can no longer be beaten by men, raped by men, and traded between men as commodities, can they cease to be treated or to see themselves as passive bodies to be acted upon by men.

Women need a sense of their own integrity and to have that integrity affirmed by males. They need to have a full range of life opportunities for their many creative roles, of which reproduction is only one. They need to have the knowledge and technology of birth control and the right to enforce these in sexual relations with men. They need to have a sense that their daughters' as much as

their sons, will have these many options and will be given education for them. Finally they need to see themselves as responsible agents for a just and sustainable society in their communities'

Although the empowerment of women as moral, economic, and cultural agents in their own right is crucial for effective "family planning," it also lies at the base of all the value changes that will lead from cultures of domination to cultures of biophilic mutuality. The "liberation of women" cannot be seen simply as the incorporation of women into alienated male styles of life, although with far fewer benefits, for this simply adds women to the patterns of alienated life created by and for men. In fact' it is impossible to fully add women to this alienated life of males, since the male alienated life-style is only possible by the exploitation of women who remain tied to "nature."

Rather, what is necessary is a double transformation of both women and men in their relation to each other and to "nature." 'Women certainly need to gain some of the individuality that has been traditionally purchased by men at their expense. But this individuation should not be based on exploitative domination (of other women or subjugated men), but needs to remain in sustaining relation to primary communities of life. The ways of being a person for others and of being a person for oneself need to come together as reciprocal, rather than being split between female and male styles of life.

It is the male rather than the female life-style that needs, however, the deeper transformation. Males need to overcome the illusion of autonomous individualism, with its extension into egocentric power over others, starting with the women with whom they relate. Men need to integrate themselves into life-sustaining relations with women as lovers, parents, and coworkers. They need to do regularly what they have hardly ever done, even in preagricultural societies: feed, clothe, wash, and hug children from infancy, cook food, and clean up wastes.

Only when men are fully integrated into the culture of daily sustenance of life can men and women together begin to reshape the larger systems of economic, social, and political life. They can begin to envision new cultural consciousness and organizational structures that would connect these larger systems to their roots in the earth and to sustaining the earth from day to day and from generation to generation.

Both the "liberation" of women into male styles of alienated pseudoautonomy and the domestication of men into women's dependency are equally false compensations, if they function within the present pattern of distortion, and are not part of a larger transformation. The domestic-public split itself must yield to a new sense of a holistic culture that recognizes both men and women as individuated persons in mutual interdependency with each other and with the earth.

What we need is neither optimism nor pessimism, in these terms, but committed love. This means that we remain committed to a vision and to concrete communities of life no matter what the "trends" may be. Whether we are immediately "winning" or "losing" cannot shake our rooted understandings of what biophilic life is and should be, although we need to adapt our strategies to the changing fortunes of the struggle. 'We also remain clear that life is not made whole "once and for all," in some static millennium of the future. It is made whole again and again, in the renewed day born from night and in the new spring that rises from each winter.

We must start by recognizing that metanoia, or change of consciousness, begins with us. This does not happen all at once, but is an ongoing process. 'We all have been shaped to misname evil, to seek invulnerable power, or else to capitulate to such power demands in the hands of male authorities. We are tied to present systems of consumption and can hardly imagine alternatives to them that might give us greater peace and wholeness, even though the scramble to "keep up" in the present systems leaves us ever more insecure, anxious, and exhausted.

Being rooted in love for our real communities of life and for our common mother, Gaia, can teach us patient passion, a passion that is not burnt out in a season, but can be renewed season after season. Our revolution is not just for us, but for our children, for the generations of living beings to come. What we can do is to plant a seed, nurture a seed-bearing plant here and there, and hope for a harvest that goes beyond the limits of our powers and the span of our lives.

Recapitulation

The cosmological situation as we have now discovered it to be is that the conscious sentience of the universe arises from the living biota and so far as we know, only the conscious biota. As the mediators of conscious intent, we each inherit a personal responsibility to care for the universe we inhabit and to ensure life within it continues to flower and does not suffer risk to its future viability through human exploitation. This is the prima facie responsibility, we each inherit as incarnate sentient beings.

It is abundantly clear that humanity is risking a planetary extinction of the diversity of life due to human misadventure, driven by business as usual's, non-renewable energy consumption and habitat destruction and by the scorched earth moral delusions of world religions which are founded on moral imperatives that deny the sacredness of cosmological nature in what is an immortal Paradise, in favour of fantasies of heavenly and diabolical realms.

Fig 244: "Paradise Found" David Miller

We can thus no longer continue to see through a glass darkly in the distorted prism of Christianity's eschatological expectation and the false belief in a man-God who still hangs mortified on the cross two thousand years later in every church, whose flesh and blood we must consume, while endlessly awaiting the return of the Lord in power to have forgiveness of sins and achieve immortal life. It is now time for us to put away childish things (Ranke-Heinmann 1992), to see face to face and know also as we are known.

*"When I was a child, I spake as a child, I understood as a child, I thought as a child:
but when I became a man, I put away childish things.
For now we see through a glass, darkly; but then face to face:
now I know in part; but then shall I know even as also I am known" (1 Corinth 13:11).*

It is we who are the portal of cosmic awareness and the buck stops with us to take responsibility as stewards and guardians of the tree of evolutionary life, to ensure it survives and flowers in perpetuity. To allow this to fail is to anoint us all for our burial, with no hope of salvation.

The remedy the psychic species provides is to give us a direct route to experience reunion with the awakening of the conscious universe, so that we can learn to protect the planet as guardians of life in evolutionary and cosmological time scales. This both alleviates our mortal fear and gives us the ability to make our lives a meaningful part of unfolding life rather than a curse upon it.

The meaning and significance in the spiritual quest of humanity lies not in false fantasies of Heaven and Hell or the Rapture in the sky, but in developing the spiritual insight and practical motivation to care for the planet as guardians of the diversity of life in evolutionary time, so that life can truly flower as a cosmological phenomenon of conscious illumination over cosmological time scales. This is profoundly urgent and it can be achieved if we recognise the wisdom and inevitable necessity of this together.

15. Redemption of Soma and Sangre in the Sap and the Dew

Despite its history of spilled blood, violent Crusade and eschatological apocalypse, redemption is at hand. Christianity stands uniquely positioned as the founding religious tradition underlying Western culture. Christianity is also uniquely positioned as the prime vehicle of a worldwide sacramental religion, founded on 'holy communion' - a flesh and blood sacrament - the *sangre* and *soma* – albeit symbolic of a sacrificial death – “cannibalistically” eating the flesh and blood of the saviour. This aspect of Christianity is a disjunct with the Hebrew tradition and has closer connections with the Greek epoptea, the maenads and their belladonna, and Dionysus as the god of wine and altered states, echoing Yeshua's miraculous dread. It is thus, by an accidental fusion of cultural histories, the natural forerunner of a sacramental tradition of true integration with life immortal. These simple wafers of bread and sips of diluted wine carry no effect in themselves, but claim to infer a reality so powerful that merely to partake of the 'eucharist' is deemed to be the innermost mystery of communion with the godhead. If such a sacrament is going to be of functional effect, one should as the “acid test” of validity, expect it also to be a potent psychoactive substance in biological terms.

Fig 244b: William Blake - *The Marriage of Heaven and Hell*, later cited by Aldous Huxley in his book "The Doors of Perception" on his mescaline experience.

The notion of “sacrament” as something natural that is consumed to make ‘holy’ or whole poses a central question of symbiotic paradox in consciousness. How is such completion achieved in the universe? Is it arrived at through an outer journey of scientific or empirical discovery in the material world? Is it to be found through philosophical analysis and discourse? Is it to be found in a covenant of submission to the will of God? Is it to be pursued through an arduous meditative journey into the innermost reaches of the mind and soul to the cosmic self? Or is it to be found in symbiotic reunion in the interactive mysteries of the ‘living sacraments’ of the biosphere and the nierika portal to the cosmological mind at large?

Each of the three entheogenic living sacraments discussed in Section 1 have been adopted within nominally Christian traditions, seamlessly integrating the biospheric sacraments with Christian sentiments, attesting to Christianity’s redemption as a sacramental tradition to reflower the Earth as a living paradise throughout the generations of humanity and life as a whole. Some researchers have also associated Christian roots with entheogens (Allegro 1970, Hoffman et al. 2001, Brown & Brown 2016).

The experiences of these participants are consistent with each of those who ascend its spiritual peaks identifying with being first person transformative visionaries forming a spiritual consensus deeper than religious doctrine. Maria Sabina, despite being in the Catholic sisterhood, expressed in her chants these visionary positions: *“I am the Lord eagle woman. Woman of a sacred, enchanted place am I, says, Woman of the shooting stars am I. ... I am Jesus Christ, says ... I’m the heart of the virgin Mary.”* Likewise with peyote: *“Jesus came afterwards on this earth, after peyote”. “The white man goes into a church and talks about Jesus, but the Indian goes into a teepee and talks to Jesus”.*

Maria Sabina’s Holy Table and Gordon Wasson’s Pentecost

Fig 245: Upper row: Maria Sabina at prayer during the velada, giving mushrooms to Gordon Wasson, Maria collecting Psilocybe mushrooms for the velada. Lower row: Maria Sabina performing a mushroom velada. Blessing the mushrooms before the altar, altar, consuming the mushrooms.

Maria Sabina (see section 1) was both a Mazatec curandero of the “little things that spring forth” – *teonanactl* – flesh of the gods and at the same time a life long member of the Catholic sisterhood. The sacred mushroom is ‘known to the ancient Meso-Americans as the Flesh of God, echoing the soma and sangre of the Christian Eucharist (Harner R229 90). The mushrooms were consumed before a small altar. The curandera kept one corner free so that the Holy Ghost ⁷⁹ could descend in the form of the sacred words that came to her, the words of her little book: “I see the word fall, coming down from above as though they were little luminous object falling from heaven. The word falls on the Holy Table, on my body, with my hand I catch them word for word.” (Halifax 134).

⁷⁹ In Christianity, the Holy Ghost, or Spirit, is the ultimate reality not to blaspheme against: *“Jesus said: He who blasphemes against the Father will be forgiven, and he who blasphemes against the Son will be forgiven; but he who blasphemes against the Holy Spirit will not be forgiven, either on earth or in heaven.”* (Thom 44, as in Mark 3.28, Luke 12.31, Matt 3.28 with the exception of the Father). The grammatical gender of the word for “spirit” is feminine in Hebrew (רוּחַ, rūah), neuter in Greek (πνεῦμα, pneûma) and masculine in Latin (spiritus). The neuter Greek πνεῦμα is used in the Septuagint to translate the Hebrew רוּחַ. Holy Spirit was equated with the feminine Wisdom of God by two early Church fathers.

'On both nights Wasson stood up for a long time in Cayetano's room at the foot of the stairway, holding on to the rail transfixed in ecstasy by the visions that he was seeing in the darkness with his open eyes. For the first time that word 'ecstasy' took on a subjective meaning for him. ... There came one moment when it seemed as though the visions themselves were about to be transcended, and dark gates reaching upward beyond sight were about to part, and we were to find ourselves in the presence of the Ultimate. We seemed to be flying at the dark gates as a swallow at a dazzling lighthouse, and the gates were to part and admit us' ... 'In sum, concluded Wasson, the mushrooms "transport one for the nonce to heaven, where all the senses unite in a joyous symphony shot through with an overwhelming feeling of caritas, of peace and affection for the fellow communicants. The effect is a transcendence of the barriers existing between people, including the language barrier.' (Riedlinger 31).

The mushrooms were consumed before a small altar. The curandera kept one corner free so that the Holy Ghost could descend in the form of the sacred words that came to her, the words of her little book: "I see the word fall, coming down from above as though they were little luminous object falling from heaven. The word falls on the Holy Table, on my body, with my hand I catch them word for word." (Halifax 134).

*Illumination of life, Illumination from on high, says
Illumination of the sap, Illumination of the dew (Maria Sabina)*

Acts notes the advent of the Holy Spirit in the "upper room": *"These all continued with one accord in prayer and supplication, with the women, and Mary the mother of Jesus, and with his brethren. ... And when the day of Pentecost was fully come, they were all with one accord in one place. And suddenly there came a sound from heaven as of a rushing mighty wind, and it filled all the house where they were sitting. And there appeared unto them cloven tongues like as of fire, and it sat upon each of them. And they were all filled with the Holy Ghost, and began to speak with other tongues, as the Spirit gave them utterance"* (Acts 2.1).

Riedlinger (1992) notes: *'He also knew that, many centuries ago, the Mazatec Indians had combined what was to them a new religion, Christianity, with their ancient pagan practices, producing a syncretic hybrid focused on physical healing. In that sense, it is true, as Wasson noted, that the "Old Order does not mix with the New. The wisdom of the Sabin [Wise Ones], genuine though it was, has nothing to give to the world of tomorrow." In other words, such practices cannot be appropriated whole; they cannot be transplanted from one culture to another without changing their content and-forms to address the particular needs of the host culture.'*

"In light of Gordon Wasson's numerous referrals to the original Pentecostal experience, I believe he thought it feasible for modern Christianity to likewise adopt certain elements of this indigenous hybrid, [of pre-Colombian and Catholic notions] producing an experiential form of Christian worship in the Pentecostal mode which uses hallucinogens as sacraments for calling down the Spirit. Wasson's opinion of what this portends for Christian worship is unequivocal": '... God's flesh! How those words echo down the centuries of religious experience! The Christian doctrine of Transubstantiation is a hard saying, calling for great faith The Mexican Indian with his teonanactl has no need for Transubstantiation because his mushroom speaks for itself. By comparison with the mushroom, the Element in the Christian agape seems pallid. The mushroom holds the key to a mystical union with God, whereas only rare souls can attain similar ecstasy and divine communion by intensive contemplation of the miracle of the Mass'."

The Man in the Buckskin Suit

While the Huichol sacred use of peyote (see [section 1](#)) has continued ever since the arrival of Columbus, the Native American Church, also known as Peyotism and Peyote Religion, teaches a combination of traditional Native American beliefs and Christianity, with sacramental use of the entheogen peyote. The religion originated in the Oklahoma Territory (1890–1907) in the late nineteenth century, after peyote was introduced to the southern Great Plains from Mexico. Today it is the most widespread indigenous religion among Native Americans in the United States (except Alaska Natives and Native Hawaiians), Canada (specifically First Nations people in Saskatchewan and Alberta), and Mexico, with an estimated 250,000 adherents as of the late twentieth century.

Jesus came to the white man as flesh and blood, but to the Native American as peyote. John Wilson, who many claim as the 'founder' of the peyote religion in the United States claimed that he was continually translated in spirit to the 'sky realm' by peyote and it was there that he learned the events of Christ's life and the relative position of several of the spirit forces such as sun, moon and fire.

He reported that he had seen Christ's grave, now empty and that peyote had instructed him about the 'Peyote Road' which led from Christ's grave to the moon (this had been the Road in the sky which Christ had travelled in his ascent. Most peyotists strongly affirm the Christian elements as an important part of their religion (Anderson 36, 51):

*"God told the Delawares to do good even before He sent Christ to the whites who killed him ...
God made Peyote It is His power. It is the power of Jesus. Jesus came afterwards on this earth, after peyote."*

*"You white people needed a man to show you the way,
but we Indians have always been friends with the plants and understood them ...
The white man goes into a church and talks about Jesus ,
but the Indian goes into a teepee and talks to Jesus."*

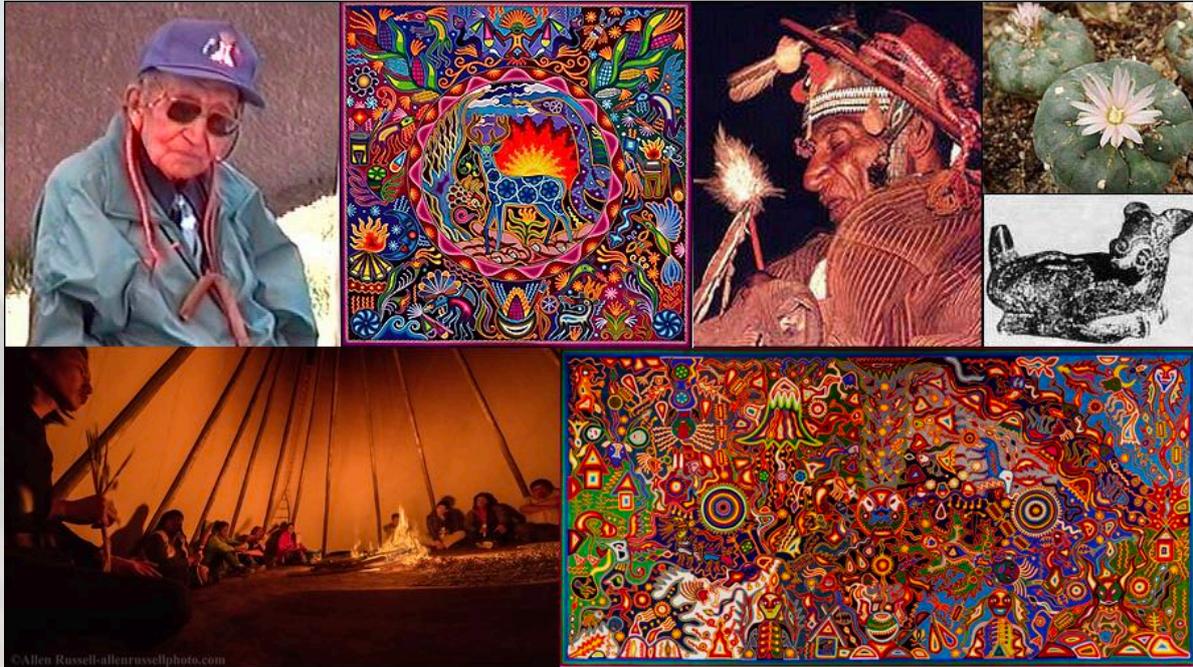

Fig 246: My roadman Tellus Goodmorning. The Nierika or cosmic portal of Kauyumari or Elder Brother Deer, linking the underworld with Mother Earth, through which the gods came (Nierika Arts). Through it all life came into being. It unifies the spirit of all things and all worlds. (Schultes & Hofmann 1979). Don Jose Matsuwa, peyote in flower, deer holding peyote in its mouth (Monte Alban 500 BC). Lower: A peyote meeting involves alternate rounds of chanting around the fire and personal healing, overseen by a road man and mother waters. La visión de "Tatutsi Xuweri Timaiweme" – a Huichol world view.

However, it is Christ in his second-self who came to give the peyote ritual to the Menomini:

"This old man was a chief of a whole tribe, and he have his son to be a chief. He said, 'I'm going to go, and you take my place. Take care of this [tribe].' And the boy, he went out hunting; He was lost for about four days. He began to get dry and hungry, tired out; so he gave up. ... So he went, lay himself down on his back; he stretched out his arms like this [extending his arms horizontally], and lay like that. Pretty soon he felt something kind of damp [in] each hand. So he took them, and after he took them, then he passed away. Just as soon as he - I suppose his soul - came to, he see somebody coming on clouds. There's a cloud; something coming. That's a man coming this way, with a buckskin suit on; he got long hair. He come right straight for him; it's Jesus himself. So he told this boy, 'Well, one time you was crying, and your prayers were answered that time. So I come here. I'm not supposed to come; I said I wasn't going to come before two thousand years,' he said. 'But I come for you, to come tell you why that's you [are] lost. But we're going to bring you something, so you can take care of your people.' ... So they went up a hill there. There's a tipi there, all ready. So Christ, before he went in it, offered a prayer. ... 'Take this medicine along, over there. Whoever takes this medicine, he will do it in my name.' So that's how it represents almost the first beginning." (Anderson 23-4).

Santo Daime and the Union Vegetale

The indigenous use of Amazonian ayahuasca (see [1](#), [2](#)), has been reformed into modern religious movements. There are three main churches: Santo Daime, Barquinha and União do Vegetal (UDV). The Union Vegetale or UDV is a nominally Christian movement devoted to experiencing inner harmony through partaking of ayahuasca tea, to "remember past lives and to understand the true meaning of reincarnation as well as to become familiar with the origin and the real destiny of nature and of man". The UDV seeks to promote peace and to "work for the evolution of the human being in the sense of his or her spiritual development". It has over 18,000 members, distributed among

more than 200 local chapters in all the states of Brazil, as well as in Peru, Australia, several countries in Europe, and the United States. The translation of União do Vegetal is Union of the Plants referring to the sacrament of the UDV, hoasca, or ayahuasca tea.

Likewise in Santo Daime, a Christian core is combined with other elements, such as an emphasis on personal gnosis and responsibility, an animist appreciation of nature, such as the Sun, Moon and Stars, as well as the totemic symbol of the beija-flor (hummingbird). They do not track members, but estimates suggest tens to hundreds of thousands attend the Santo Daime church each week. Spiritual beings from indigenous Amazonian shamanism and deities from the African pantheon are also incorporated into the doctrine. The nature of the work is sometimes personified and addressed as Juramidam, "God (jura) and his soldiers (midam)", disclosed to Irineu in his visionary experience.

Fig 247: Left: Santo Daime church with double cross and large ayahuasca flasks. Left centre: UDV ceremony with ayahuasca boiling in large pots and people reclining to experience the effects. Right: Chungatuya curing – Pablo Amaringo. Inset: Left Chacruna and the Vine of the Soul make ayahuasca, right my curandero Snr. Trinico.

Ayahuasca, consumed by Daimistas in ceremonies, has many different traditional names, but is known within the Santo Daime as Santo Daime, meaning Holy Daime, or simply, Daime, as originally named by Irineu. Dai-me (with a hyphen) means "give me" in Portuguese. A phrase, Dai-me força, dai-me amor ("give me strength, give me love"), recurs in the doctrine's hymns. Participants in the ritual come to submit themselves to a process through which they may learn. This may include various wonders — ayahuasca is known for the visions it generates, and the sense of communion with nature and spiritual reality — as well as more mundane, less pleasant lessons about the self. The Daime is thought to reveal both positive and various negative or unresolved aspects of the individual, resulting in difficult "passages" involving the integration of this dissociated psychological content.

These movements clearly show how Christianity can make a transition to a sustainable tradition reparadising the planet. However, what is at stake here goes far beyond Christian horizons. It is the discovery that the mystical visionary state is unlocked, not by doctrine or conscious control, but the incipient visionary cyclone surrounding the portal to ultimate reality that comes from the symbiosis with the 'Other' – the cosmological consciousness of the mind at large.

The Society of Friends and Non-sacramental Mystical Experience

This doesn't mean that everyone needs to take the sacrament, as in the Eucharist in 'Holy Communion'. Indeed Pentecost was alleged to have taken place 'in the upper room' in the manner of a mystery cult, but the change in sacralising the entheogenic sacraments can induce a root change in the zeitgeist, by those partaking becoming a similar source of conscious 'spiritual knowledge' informing the wider population of the inner nature of reality as it is experienced in the first person.

In this respect, the Society of Friends (Quakers) form an almost ideal counterpoint to the sacramental visionary path. Quakers embrace mysticism, as the personal experience of the divine (Atchley 2017, Brown 2012, Meyer E):

Rufus Jones (1863–1948) was arguably the foremost Quaker scholar, writer, and advocate of opening to mystical experience as a central practice among Friends. He built on foundations laid by Meister Eckhart, the anonymous author of The Cloud of Unknowing, William James, and many other Christian mystics—people who had had direct experiences of God and tried to describe them. Jones concluded that the founders of most great religions of the world got their spiritual understanding through mystical experience. The

Hebrew Bible and the New Testament are filled with reports of direct experiences of God. Mystical experience "makes God sure to the person who has had the experience," wrote Jones (Atchley 2017).

However they refrain from using the term mysticism as as too confining. This leads to an all-inclusive acceptance of divinity experienced directly in person transcending conventional notions of God and extending to "the Divine ground of all being":

Jones cautioned against using the term "mysticism." Each seeker of "God within" is confronted by a unique personal and cultural labyrinth that he or she must negotiate to directly experience God. Because each path is different, it is impossible "to make an ism out of" the journey to experience God. But perhaps we can agree that we seek direct experience of "the Divine Ground of All Being" – the term Christian theologian Paul Tillich used for the transcendent Holy Spirit. Perhaps we can agree that we are all dancing around a divine Light that eludes naming. Jones also pointed out that we are seeking our own direct experiences of God, not "second-hand descriptions" of mystical experiences in books and scriptures. However beautiful and uplifting Eckhart's descriptions of his direct experiences of God might be, we cannot have his experience. We can only have our own (ibid).

Fig 248: George Fox reading a Bible under a tree (Robert Spence), Quakers Meeting (Egbert van Heemskerck the Elder)
Below: Modern Quaker Meeting Berkhamstead Right: The certificate of my marriage to Hallie witnessed by all present.

Quakers specifically forgo the eucharist as a ritual distraction from the experience of Divinity and even more importantly are founded on an utterly egalitarian principle of complete equality of spiritual experience, shared between periods of contemplative silence and sharing personal accounts of their experiences (Wilde 2016):

The Quakers have never celebrated the Eucharist or any sacraments. This is partly because they are a tradition which is historically teetotal, like Methodists. More importantly, it is because Quakers find that all ritual distracts and takes focus away from God. Also, Quakers believe that ministry is not only equal between men and women, but that it belongs to all people, not just a few ministers.

This brings their tradition very close to the principle of subjective empiricism by mutual affirmation.

- Quakers do not have a written creed. Instead, they hold to personal testimonies professing peace, integrity, humility, and community.
- Quakers believe that God's kingdom is now, and consider heaven and hell issues for individual interpretation.
- Unlike other Christian denominations, Quakers believe that humans are inherently good. Sin exists, but even the fallen are children of God, Who works to kindle the Light within them.

The Society of Friends thus forms a counterpoint to the sacramental tradition for those who wish to pursue the discovery of true spirituality not contaminated by prescriptive doctrine and ritual that also lies in the purest traditions of the Christian origins that led to Pentecost. [Unitarian Universalists](#) and Quakers share many principles. It is therefore common to see Unitarian Universalists and Quakers working together. So many of these comments apply to Unitarian Universalists as well, characterised by a "free and responsible search for truth and meaning". Unitarian Universalists assert no creed, but instead are unified by their shared search for spiritual growth. These traditions are summarised by the Principles of Unitarian Universalism, (1) The inherent worth and dignity of every person; (2) Justice, equity and compassion in human relations; (3) Acceptance of one another and encouragement to spiritual growth in our congregations; (4) A free and responsible search for truth and meaning; (5) The right of conscience and the use of the democratic process within our congregations and in society at large; (6) The goal of world community with peace,

liberty, and justice for all; (7) Respect for the interdependent web of all existence of which we are a part. These documents are "living", meaning always open for revisiting and reworking. That said, flower, water and bread communion seem to miss out the medicinal features of plants and fungi that are there for our benefit and for our spiritual unfolding, unless we interpret "flower" as having genuine sacramental capacity.

The term Unitarian is sometimes applied today to those who belong to a Unitarian church but do not hold a Unitarian theological belief. In the past, most members of Unitarian churches were Unitarians also in theology. Over time, however, some Unitarians and Unitarian Universalists moved away from the traditional Christian roots of Unitarianism. For example, in the 1890s the American Unitarian Association began to allow non-Christian and non-theistic churches and individuals to be part of their fellowship. As a result, people who held no Unitarian belief began to be called Unitarians because they were members of churches that belonged to the American Unitarian Association. After several decades, the non-theistic members outnumbered the theological Unitarians.

Fig 249: "Adam and Eve" Lucas Cranach

The disciples said to Yeshua, "Tell us how our end will be." Yeshua said, "Have you discovered, then, the beginning, that you look for the end? For where the beginning is, there will the end be" (Gospel of Thomas 18).

The Vision Quest to Discover Symbiotic Existential Cosmology

Introduction

So what is this key to life, the universe and everything about? I'm going to explain all this, but first we need to take stock of the actual situation we are all facing in raw acute terms of planetary survival.

Although a visionary, I am first and foremost a scientist, who has spent my life lecturing in mathematics, with a research speciality in quantum cosmology, chaos theory, fractal processes, neuroscience and biocosmology. This means that my entheogenic journey, the bubbling Dionysian spring I am going to intoxicate you with, is founded on a real, verifiable, scientific cosmology, not just some kind of spiritual pipe dream, but this cosmology is putting consciousness, and our free will to affect the world around us, right back into the driving seat, and that is going to upend the Copernican principle that humanity does not have a privileged view of the universe at large.

The Three Faces of Symbiotic Existential Cosmology

The symbiotic cosmology solves (1) the **hard problem** – why subjective consciousness exists, (2) the **problem of conscious intent** – how volitional will acts on the world, and (3) the **central enigma of existential cosmology** – the role of conscious life in the universe. It does this simply and directly, without invoking any spooky features of panpsychism, by applying objective physical and biological criteria to define complementary subjective modes, by the coherent forms of instability involved, so it uses objective science to qualitatively classify subjective phenomena.

- (1) **Fractal biocosmology**: The fact that life is a consequence of quantum cosmology is blindingly obvious! Just look around you! Life exists! It does so because it is an interactive manifestation of the laws of nature. While the cosmological **energy pathway** leads to the cosmic web, galaxies, black holes and stars; the **structural pathway** of the four symmetry-broken forces of nature leads to a fractal universe – quarks, composite baryons, atomic nuclei, atoms, fractal molecules, molecular complexes, cell organelles, cells, tissues, organs, the conscious brain, organisms and biospheres.
- (2) **Darwinian panpsychism**: This is again irrefutable that we all as subjective conscious agents, are consciously aware that we have volitional will over the physical universe in our decision-making and actions. But this means matter including brains have a hidden subjective aspect. This implies panpsychism. There thus follows a spectrum of graduated manifestations of subjectivity, from quantum to edge-of-chaos to cell to organism and biosphere, based on the biological and physical criteria giving rise to these systems. It is faithful to Darwin's own statement that free-will extends to the cnidaria, further extending it to all eucaryotes.
 - A. **Primitive subjectivity**: The ability of the subjective mind to affect the physical brain means the natural world has to have a primitive subjective aspect – autonomous volitional will thus implies natural panpsychism. Individual quanta, quantum-sensitive "butterfly effect" systems and prokaryote cells thus each inherit a primitive subjective aspect, although not attentive consciousness as such.
 - B. **Sentient consciousness** arose in a discrete transition in single-celled eucaryotes, accompanying the endosymbiosis between archaea and bacteria, when respiration became internalised in the mitochondria, leaving the cell membrane free for sensory functions through edge-of-chaos membrane excitation and social signalling via primal neurotransmitters such as serotonin, to anticipate threats and aid survival. This "experiential anticipation" predated multi-cellular nervous systems by a billion years.
 - C. **Organismic consciousness** emerged in multi-celled animals using the same edge-of-chaos excitability and social signalling molecules as in single-celled species as neurotransmitters. This explains why animals continue to be subjectively conscious through natural selection for survival, with nervous system phase coherent parallel processing seamlessly incorporated much later, but never replacing experiential anticipation.
 - D. **Uncertainty and mind**: The action of mind on brain necessarily arises from modulating the "random" aspect of quantum uncertainty in edge of chaos brain processing. This enables volitional will to intervene in the brain without disrupting the partial causal closure in computational brain processing. This provides plenty of room to affect the uncertain outcomes in evolutionary survival using both subjective anticipation and historical experience.
 - E. **Biosphere and universe**, in turn, inherit an indirect form of consciousness through the conscious biota that exist within them, as the most complex interconnected climax manifestations of sentient consciousness in the universe.
- (8) **Symbiotic Cosmology**: The universe is symbiotic biologically, psychically, and cosmologically, throughout.
 - A. **Organismic**: All higher (eucaryote) organisms are multiply symbiotic species, by archeal-bacterial endosymbiosis, sexual symbiosis, and viral/TE symbiosis.
 - B. **Biospheric**: Survival of the fittest is survival of the fittest biospheric symbiont, not the most dominant species, or the fastest reproducer. All species, including humans, whether parasites, hosts, predators or prey, evolve to symbiotic climax and inherit their cosmological role in conscious existence through symbiosis with the diversity of life over evolutionary time scales, rather than exploiting it, causing a mass extinction, as humans are currently doing. . Lions are predators but they kill the herbivore stragglers ensuring the herbivores don't go to boom and bust. Species which fail the test like humans become extinct.
 - C. **Psychic**: Psychedelics play a critical role in this symbiotic evolutionary process, as the perceptual mind of the unconstrained brain reflecting the psychic symbiosis of inner cosmological climax edge-of-chaos dynamics, transcending tribal egotism, in what the Upanishads call moksha. This enables the individual to experience from the cosmic viewpoint and the universe to become

self-aware. Humans thus inherit an existential responsibility, as climax manifestations of fractal biogenesis, to sustain the evolutionary diversity of life over the cosmological time scales we have inherited and need to preserve and unfold.

D. Cosmological: The climax of cosmology – conscious paradise on the cosmic equator in space-time arises not from the dominance of one conscious species, but at the edge of chaos, in symbiosis.

Given the fact that it is consistent with the views of both Charles Darwin, the founder of biological evolution and Erwin Schrödinger the discoverer of the quantum wave function equation determining the structure of quantum chemistry, it behoves us to take their advice and take this cosmology seriously:

“There is obviously only one alternative, namely the unification of minds or consciousnesses. Their multiplicity is only apparent, in truth there is only one mind. ... I should say: The overall number of minds is just one” (Schrödinger).

*“To see a puppy playing [one] cannot doubt that they have free-will”
and if “all animals, then an oyster has and a polype.” (Darwin)*

Panpsychism also makes it possible for quanta to “observe” and hence collapse superpositions of other quanta, so the universe is how we perceive it to be, not a shadow multiverse, with ghostly cats flung all over it, this picture is one in which new branches are being created in the wave function in a similar manner to [fractal cosmic inflation](#) while others are being collapsed by conscious measurement, resulting in dynamic evolution of the cosmic wave function. Special relativity, the most classical part of quantum reality, is implicitly retrocausal as well as causal, as in [Feynman diagrams](#), so quantum reality is implicitly anticipatory, involving transactional collapse across relativistic space-time in which a network of potential [quantum transactions](#) become one or a set of real emitter-absorber interactions.

Consciousness thus exists to anticipate existential threats, as Graziano's [AST](#) – attention schema theory highlights, although incorrectly thinking free will is a delusion. Darwinian panpsychism is also very like Tononi and Koch's [IIT](#) – integrated information theory, except it's based on edge-of-chaos dynamics, which fits with the quantum world, through the butterfly effect, while IIT is a classical computational theory about Markov processes, so phi doesn't capture the root phenomenon, of subjective awareness since sentient consciousness preceded computation, not the reverse.

Taking the Planetary Pulse

First we need to take the therapeutic pulse of the world condition. Although we conceive of ourselves as living in a world of scientific, social and medical sophistication, in which technology is enabling us to reach for the stars, the majority of people on the planet adhere to fixed beliefs in archaic religions which are cosmological fallacies in frank and violent conflict with the natural world. In 2020 56% of the population of Earth belonged to one of the monotheistic religions, Judaism, Christianity and Islam. All of these religions have belief systems focussing on the natural world and entire physical universe we exist in being merely a temporary moral test for a tumultuous end-of-days Armageddon apocalypse. In the resulting day of judgment, all of humanity will be consigned either to eternal life in Heaven, or an endless diabolical torment in Hell, shedding the verdant Earth and its billions of years of evolving diversity as a kind of skin to be sloughed off, in what Christians call the Rapture. This is compounded by a literalistic belief in creationism, or intelligent design by God, assigning evolution and the diversity of life to being disposable assets. Rather than make the world a better place, this cosmological fallacy abets the worst in human instincts for business-as-usual to exploit the living and non-renewable resources of the planet, in a patriarchal regime of dominion over nature that leads to an accelerating impact on the habitats of all the other species, and pushes the natural environment to potentially irreversible tipping points.

Compounding this is an even more ancient crisis that happened to humanity during the transition from gatherer-hunter coexistence with nature to civilisations based on agriculture and animal husbandry that is confessed in the Fall from Eden. The male fear of paternity uncertainty caused mankind to condemn the female sex to subservience, in an assertion of patriarchal dominance, reinforced by the monotheistic religions, although widely shared across all cultures [sealed into our genome](#) from around 10,000 years ago. This is clearly laid out in Genesis, in Eve being cursed for seeking the wisdom of the Tree of Life, being accused instead of eating the fruit of the tree of the knowledge of good and evil, destroying their paradisiacal innocence, sexually declared to God by the fig leaf. Humanity was cursed and driven out of Paradise by God, with the Tree of Life hidden behind a flaming sword. Man and woman alike were doomed to the mortal coil of sexual existence. Women were cursed as the “devil's gateway”, to be obedient to their husbands and suffer the pains of travail childbirth, with mankind condemned to a life of struggle against nature to

survive against the thorns, to till the ground in human dominion over nature, delineating the transition from gatherer-hunter paradise to the lost innocence of agricultural civilisation.

This in turn has led to a world in which major religions use the patriarchal imperative to increase their populations to achieve social dominance, leading to population explosion, suppressing female reproductive choice under dire penalties, from stoning for adultery, to female genital mutilation, veiling, chaperoning and denying jobs and education and escalating human impact on nature through the invocation to dominion over nature, in denial of Earthly Paradise.

I am a child of nuclear apocalypse. On Christmas Day 1944 the first radiated plutonium slugs began to roll out of Hanford, signalling the real beginning of the apocalyptic age of Planet Earth. My birth was 12 days later on the Epiphany 1945. Los Alamos received its first plutonium from Hanford on February 2. Consecrating this patriarchal apocalypse, the Trinity explosion of this plutonium occurred on July 16. The uranium Hiroshima bomb was named "little boy" and the plutonium Nagasaki bomb dropped on August 9 from the same Hanford material was "fat man".

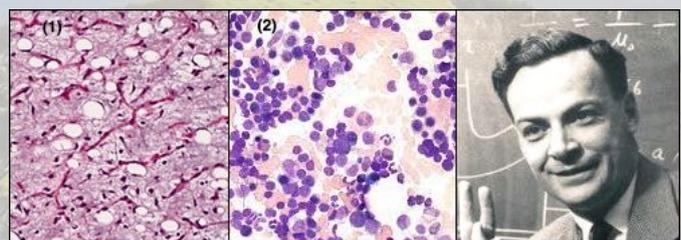

Michael Ortiz Hill (1994) in "Dreaming the End of the World: Apocalypse as a rite of Passage" describes the first words following the Trinity test:

Fig 249b: Trinity fireball.

It is striking that, following Oppenheimer's lead of naming the site of the first nuclear test "Trinity," Weisskopf and William Laurence - both Jews - saw in the Bomb the glory of Christ. In the Jewish tradition, the character of the Messiah has distinctly human dimensions, a "Son of Man" rather than the "Son of God" of Christian eschatology, while the Christ metaphor

speaks to an experience that dwarfs the human realm. Ferenc Szasz notes, "Others whispered, more in reverence than otherwise: 'Jesus Christ' ". Known to be something of a mystic, I. I. Rabi described Trinity by the overwhelming light that engulfed him: "Suddenly, there was an enormous flash of light, the brightest light I have ever seen or that I think anyone has ever seen. It blasted; it pounced; it bored its way right through you. It was a vision which was seen with more than the eye. It was seen to last forever. You would wish it would stop; altogether it lasted about two seconds.... Oppenheimer said, "We waited until the blast had passed, walked out of the shelter and then it was extremely solemn. We knew the world would not be the same. A few people laughed, a few people cried. Most were silent" He recalled the terrible and ecstatic eleventh chapter of the Bhagavad-Gita, where the warrior Arjuna requests that Vishnu display the nakedness of his transcendental form. Arjuna is cowed in holy terror as the god visits upon him "the radiance of a thousand suns" "Now I am become Death, the destroyer of worlds" Oppenheimer quoted the Gita. "I suppose we all felt that, one way or another," he continued. Three weeks later, the pilot of Enola Gay, Paul Tibbets, requested God's blessing upon the Bomb that would initiate the citizens of Hiroshima into the darkest consequences of this ecstatic presence. "Be with those who brave the heights of Thy heaven intoned the chaplain, "and carry the battle to our enemies".

Fig 249c: In July 1945, Feynman was present at the first atomic bomb explosion in the Trinity bomb test in New Mexico. He claimed that he was the only person who saw the explosion without the very dark welder's glasses that were given to all the physicists present on that day. He thought that the truck's windshield would block the ultraviolet radiation from the blast. Believed to be as a result, at the age of 69, he died of two successive rare types cancer: (1) Myxoid/round cell liposarcoma – a rare cancer of fat cells and (2) Waldenström's macroglobulinemia – a rare non-Hodkins white blood cell lymphoma akin to leukaemia.

Another striking theme that repeats again and again in the "dreaming up" of the Bomb is that of birth and paternity. On the mythic level, it is clear that the Bomb was not invented as much as "born." Some people recognized the godlike epiphany of light and fire - so long anticipated - as the birthing of something or "someone" new. We can discern a specifically paternal pride and even hints of tenderness toward the Bomb. William Laurence called the rumblings of the Trinity explosion the "first cry of a newborn world".

However, our true apocalyptic disaster, more tumultuously destructive, over time than any fantasy that Revelation can throw at us, is planetary biocrisis – our impending biodiversity and climate crises, driven by a patriarchal culture of dominion over nature and woman alike, that seeks to exploit the Earth and its living natural diversity rather than sustain it as the immortal living Paradise that has sustained us for three billion years of evolutionary emergence, in an unbroken line of inheritance to our own existence. A survey conducted in several countries as I write (Hickman et al.

2021) has found that 56% of young people believe “humanity is doomed”, because of climate and biodiversity crisis ⁸⁰. Current evidence indicates that the climate crisis alone could send our planet back 50 million years to the Eocene maximum, shortly after the dinosaur extinction. The damage caused by a mass extinction of biodiversity can never be recovered, but in raw terms would take another 50 million years to recover from in purely quantitative terms.

Planetary Reflowering

We urgently need to learn to let life overflow in abundance again, and give space on the planet for life to do so and rapidly correct the climate crisis we are causing that also lays waste to natural habitats, so that we shall survive as a species. This is the key to our living future. It’s as simple as that. I am a scientist dedicated to preserving the biodiversity of planet Earth from the almost unstoppable human stupidity of causing a mass extinction of life which could cause the end of humanity as we know it, if we don’t come rapidly to our senses and achieve **three active priorities** to protect the living dharma ⁸¹ of the sentient cosmos:

(1) Biodiversity and Climate:

(a) **Dedicate half the Earth** and its habitats to natural wilderness so that the millions of other species we co-depend with can survive and flourish (Wilson E O 2016) . Half the planet has to be enough for one species *Homo sapiens* alone among 3.8 million others to entertain and fulfil ourselves. This is literally the only way evolution can flourish and humanity can survive, because we need genetic diversity for species survival. If we don’t do this, our probability of long term survival is bleak and, while we might repair climate, biodiversity remains in mortal danger.

(b) **Fix the climate crisis** as quickly as possible by converting to renewable energy before the climate ‘fixes’ us.

This is fully achievable and inevitable. No further financial investment, or subsidies in CO₂ emitting energy sources.

(2) Nuclear/Mass Destruction: Cease production of nuclear weapons and weapons for biological warfare for military use. Devote the technology to protecting the Earth from astronomical impacts that could cause a mass extinction.

(3) Patriarchy and Population: End the Epoch of patriarchal dominion over woman and nature that has lasted for the last 4000 years and profoundly exacerbated the population crisis, in the **reunion of woman and man** in reproductive freedom, i.e. the **Sacred Reunion**, or *Hieros Gamos* ⁸² the fertile foundation of human cultural emergence and super-intelligence in sexual paradox (Fielder & King 2004).

Scepticism, Belief and Consciousness

The sceptical approach of objective science, which has revealed all the confounding detail of the physical universe and natural world we live in, is founded on the opposite of affirmative belief, that nothing we imagine to be true can be established to be so, unless every empirical test we make in the universe is replicable and contradicts the sceptical assumption that the idea is false. Thus the doubling of the bending of light around the Sun due to the Sun’s gravitational field, confirmed Einstein’s theory of general relativity.

But science, for all its inscrutable and meticulous care and veracity, has one terrible shortcoming, the elephant in the room of subjective consciousness itself. Key to my journey of visionary discovery has been the realisation that subjective consciousness has a central role in cosmology and that the entire universe is not just a physical nightmare of unrestrained forces of nature creating galaxies and black holes, populated by mindless atoms and molecules and biological organisms that are simply chemical machines and that the sun is doomed to eventually destroy the Earth and eventually the entire universe will destroy itself in a heat death, cosmic rip, or big crunch. Bertrand Russel’s overwhelming pessimism sums this tragic fallacy in precise words of doom.

In this materialistic scientific view, consciousness comes to be identified as a mere epiphenomenon of brain activity, which is at best a potentially unreliable, internal model of the reality of the world around us, which has no ability to effect any causal change on the physical circumstances of the universe. Thus conscious existence is deemed to be a

⁸¹ *dharma* – the eternal and inherent nature of reality, regarded in Hinduism as a cosmic law and in Buddhism the nature of reality regarded as a universal truth.

⁸² *Hieros gamos* or Hierogamy (Greek ἱερός γάμος, ἱερογαμία "holy marriage") is a sacred marriage that plays out between a god and a goddess, especially when enacted in a symbolic ritual where human participants represent the deities

mirage, and free will is an illusion, possibly evolved so as to convince us to continue to act as if we have the will to continue, because all human decisions are just a consequence of brain functions determined by our genes and the specific circumstances of the decision we are striving to make at the time. This classical world [denial of free will](#) leaves us with the status of automatons deluding ourselves into believing we have choice, leaving all questions of ethical or moral responsibility in the dust. But the quantum universe teaches otherwise, as I shall come to explain.

Religious believers of virtually every kind find this world view completely unsatisfying for very good reasons. While traditional religious cosmologies are archaic and wildly inconsistent with the reality of the universe as we now know it to be, they exist in a conscious condition of projected fantasy, where Heaven and Hell are conceived as all-too-real experiential realms, in which a sentient being can either live an eternal life in heavenly bliss, or suffer in the endless horrors of damnation. They also go half way to allowing free will as long as we use it to obey the will of God. A scientific view, even if it has experimental verification, that claims consciousness and free will are self-fulfilling delusions holds no candle to a myth that places this real Earthly life to be a mere temporary forerunner to a moral judgment for all eternity.

This means that we, the world and its living future, are living trapped in a schizophrenic existence, in which we treat the practical details, as if we are living in the physical universe with its physical laws and material boundaries, but underlying it, for most of us, is a contradictory belief that the real world is just a delusion, or a temporary place to undergo a moral trial by God, and the true realities that solve life, the universe and everything lie in the afterlife. This is the existential crisis that we are going to heal in this discussion to unveil and reflower the [Tree of Life](#).

The full scope of this contradiction becomes apparent if we examine our living experience of the world around us. We are all forced to concede the existence of a shared physical reality, that the table I am writing on is solid, and if I crack my knuckles on it, they will hurt, if I get hit on the head, I may pass out and lose consciousness, or if I eat a poisonous plant or catch a disease I may get sick, and if I am hit by a vehicle in the street, or shot, I may die, so we are forced to concede the existence of the objective world around us and know that it is part of a physical universe of galaxies, stars and planets, composed of particles, including atoms and molecules that also make up biology and ourselves.

But on the other hand, 100% of everything we experience, including our experience of the physical world, of our dreams and of our visions, including those on mind-altering substances, occur through **and only through** our subjective conscious experiences. So the world, as we see it, is actually a consensus view of subjective conscious experiences between people, which we are confident is shared with other conscious beings around us, from their lively engaging demeanour, although we don't generally have any direct access to anyone else's subjective experience.

We also have a basic belief in our personal autonomy – to make subjective decisions that affect the world around us, many as simple as getting a cup of coffee, or going to the toilet, but also critical decisions that may seriously impact on our lives, or the world at large. The sanctity of the legal system depends on the notion that we are accountable for our actions as conscious sentient beings and do have conscious intent. This is what we call 'free will' although we know all our decisions are partially determined by their circumstances and can be influenced to a certain extent by our genes.

In Galileo's error, the panpsychic philosopher Philip Goff (2019) notes that what has subtly happened is that the scientific method, from Galileo⁸³ through Newton, converted the perceivable universe into a set of dispositions codified in mathematical equations, demoting the qualitative aspect of reality to irrelevance. This is fundamentally a patriarchal scheme of dispositional dominion over nature, reducing the phenomenal world to a set of equations. Gather-hunter societies arose from the women classifying plants and defining culture through language, while the men hunted, often silently. Thus males generally have good mental rotation and tend to navigate by vector dispositions as hunters exploring alien terrain "take the first left and then second on the right" rather than the qualitative features used by females from their careful classificatory gathering "it's opposite the pay centre after the gas station".

⁸³ Galileo despite being excommunicated for his science, was still a devoted Catholic and a traditional patriarch. He never married his children's mother and deemed his daughters unmarriedable, and soon after Virginia's thirteenth birthday he placed both girls at the Convent of San Matteo, where they lived the rest of their lives in poverty and seclusion. By contrast Galileo's son Vincenzo, who was born in Padua like his two sisters: Virginia and Livia, was named after his grandfather, and after his mother's death, his birth was legitimised by the Grand Duke of Tuscany. Virginia was Galileo's first child, born in Padua, Italy the same year that the Dominican friar Giordano Bruno was burned at the stake in Rome for insisting that the Earth travelled around the Sun instead of remaining motionless at the centre of the universe. Although none of Galileo's letters are known to have survived, 120 of Maria Celeste's exist. These letters, written from 1623 to 1634, depict a woman with incredible brilliance, industry, sensibility and a deep love for her father (Sobel 1999).

In the Newtonian universe, the patriarchal approach of analytic quantification came to dominate the description of nature, just as the patriarchal religious description dominated nature and woman alike to humanity's detriment. The end result has been that the entire subjective descriptive aspect of reality has been eliminated from the scientific world view, resulting in an inability of science to understand what subjective consciousness is and does although it is everything we experience. Patriarchal science has literally lost the subject of the case.

Belief in materialism, because of its adroit use of the sceptical principle, to correct naive assumptions and elucidate properties of the natural universe that were at first sight very counter-intuitive, has since become a belief system exactly like a religion, so that researchers cannot afford to take any other position in peril of being shunned by the dominant scientific community and losing recognition altogether. This has grown to counterproductive proportions where the very researchers showing the benefits of psychedelics scientifically are bound to declare that psychedelics have no demonstrable value in solving the central problems of conscious experience, when it is obvious they are sine qua non the most consistent modulators of the depths of conscious experience available to science.

Psychedelics – The Edge of Chaos Climax of Consciousness

This is where psychedelics and their apotheosis, in the term enthoegens, when used for spiritual purposes, come centrally into the arena. Psychoactive substances have always had a formative role in the emergence of spiritual and religious viewpoints. Cannabis, which plays a central role in Shiva worship, has been consumed in ritual spiritual practices for several millennia. Hindu religion owes a portion of its Upanishadic cosmology of the atman and Brahman as the cosmic mind to cannabis and the Rig Veda to the mythical soma of the Aryans. Traces of cannabis used for ritual purposes have been found at an ancient Judaic temple (700-900 BCE) in Arad Israel (Arie, Rosen & Namdar 2020) and also in China (500 BC). Opium likewise has an ancient medicinal and spiritual use.

However long term spiritual use of the most significant of the psychoactive species, those bearing the classic psychedelics, have largely been confined to the pre-Colombian cultures of America, where there is evidence of spiritual use of mushrooms from the Mayan culture (1000 BCE), the use of peyote among the Zapotec (500 BCE) and long term use of ayahuasca and tryptamine snuffs in South America. These substances have much more profound effects on consciousness which lead directly to a vortical abyss of visionary states renowned for their intensity and transcendence. But their relative absence from existing historical traditions outside the Americas means their significance has been bypassed by the classical world, with the possible exception of Greek mystery cults.

The discovery of LSD and the later discovery of the continuing sacred use of psilocybe mushrooms in Mexico in the mid twentieth century brought the use of hallucinogenic visionary substances back into the focus of Western culture. Although peyote use had continued by the Huichol since Columbus and had been re-established in the Native American Church at the end of the 19th century, and ayahuasca had been consumed as a sacrament in the Amazon, these had remained marginal to mainstream Western awareness. But the advent of LSD as a recreational drug supported by prominent proponents in the US, from Timothy Leary in the East Coast to the Merry Pranksters and Grateful Dead in California, advancing a counter-cultural agenda, supported by devoted chemists who were prepared to synthesise vast numbers of doses of LSD at little or no charge, conceived in the "public good", set the stage for a cultural confrontation. Accompanied by disquieting media awareness that psychedelics were laying siege to consumer culture and values, amid some troubling incidents with their use, a campaign of frank misinformation ensued from the authorities. The result was that the US and then the world introduced a total clampdown on their use that initiated the unending war on drugs, and stopped all human scientific research in its tracks.

Given the long history of sacred use of entheogens, this constitutes the most benighted quasi-religious piece of authoritarian counter-reaction in Western culture since the Inquisition and Witch Hunts, in a complete mockery of the scientific age of discovery. Penalties for psychedelic use rose to schedule 1 sentences similar to murder, reflecting the perception that this was regarded as a deadly sin rather than any scientific evidence of significant harm, but a threat to the very consumption society that is driving the planet into ecological and climatic crisis. It is only now around fifty years later that the very tentative reopening of scientific research into these substances detailed in section 1 has been able to begin to set the record straight, while still largely confining them to therapeutic use in terminal and psychiatric conditions, while their recreational use has continued, although hidden from the mainstream and somewhat trivialised as a merely a recreational rather than a deeply formative spiritual experience, as their historical use attests.

What the psychedelics provide is a negotiable transcendental experience in the vortical abyss of conscious existence comparable with and potentially more profound than the peaks of meditative and contemplative experiences in mystical and meditative traditions. They constitute a/the central vehicle for us to explore and discover the innermost nature of the subjective mind. They differ from meditation, in that they have pronounced visionary qualities that challenge existing conceptions, rather than enabling a relatively featureless repose, from renunciation and careful top down mindfulness, that is reflected in the formless void of Buddhist thinking, outside the more spontaneous satori of Zen. Likewise they transcend contemplative mysticism, which tends to reinforce preconceived theistic beliefs. They also provide a more consciously explorable complementary condition to lucid states of dreaming associated with REM sleep because these are difficult, or impossible to maintain physiologically.

Discovering Cosmological Symbiosis

This is where we come to the symbiotic cosmology that solves life, the universe and everything summarised [here](#). The existential role of consciousness in the universe is the central enigma of existential cosmology, as we have seen. That's the key thing that everyday existence, no matter how meditative we may be, or whatever preconceived beliefs we may hold, misses out on the true enormity of, so that we will go through life in a state of distraction trying to fill it with habitual purpose until it's too late and we are gone.

Around the beginning of June just over two months ago, I summoned up the will to take a sacred mushroom trip after a seven year fast due to closed angle glaucoma, recently corrected by lens replacement. In the midst on the peak, I settled into meditating on the silent question of the central enigma and let go. As I descended deep into the abyss, at a certain point, everything opened out into what I noted later that evening to be "*the epiphany of being in the existential centre of the cyclone, where everything comes into focus in the transfixing presence of complete transfiguration*". "*Not an event, but a state of knowing, as we always have known, from time immemorial, as if we have always been conscious of this knowing, forever compassionate of the mortal coil*". I have experienced this many times before on mushrooms but not in this iconic way. The result was "*a sheer calm, unmitigated experiential awakening, as if the Big Bang of the universe is discovering itself in this very moment of illumination and is realising with irresistible intensity, the urgency and vitality of this state of knowing, which, the moment one experiences it, means saving the precious universe, the biosphere and the diversity of life within it from mortal risk to its survival*". This being true, despite the overwhelming reassurance of overflowing compassion for the mortal coil emanating from the apotheosis.

Psychedelic trips can be plagued by all manner of sensory and visionary experiences, from the sublime to the ridiculous or even alarming, but there is a name for this. The Huichol call it the *Nierika*, the visionary portal to the non-ordinary reality of the spirit world and the ancestors.

*There is a doorway within our minds that usually remains hidden and secret until the time of death.
The Huichol word for it is nierika – a cosmic portway or interface between so-called ordinary and non-ordinary realities.
It is a passageway and at the same time a barrier between the worlds" (Halifax 242).*

Emerging renewed and revitalised from this experience, accompanied as I moved and breathed by the lingering shadow of the apotheosis compassionately caring for me and encouraging me to put this whole illumination together into an account for the world, I began feverishly assembling this work.

What the experience brought home to me, above all was the veridical⁸⁴ reality of the cosmic mind, even though it was evoked in a human brain on sensory withdrawal under a hallucinogenic experience. This is a turning point from many past experiences, where I have witnessed the same compassion for the mortal coil as a visionary impression of the other – transforming it from perception into reality – the actuality of Brahma-atman unification in the form extolled in the Upanishads (Purohit & Yeats 1937).

This brings us back to the hard problem of consciousness research. The advent of neuroscience has provided us with genuine insights into how the brain processes information, including sensory and cognitive tasks associated with conscious attention and resting, or meditative states. We can then associate a variety of conscious states with activity, either by electroencephalographic portraits of brain waves, by functional magnetic resonance images of blood flow to

⁸⁴ *veridical* – coinciding with reality (Oxford Languages). Mid 17th century: from Latin *veridicus* (from *verus* 'true' + *dicere* 'say') + -al. In psychology – of or relating to revelations in dreams, hallucinations, etc, that appear to be confirmed by subsequent events

specific regions, or by positron emission tomography of radioactive glucose, and even by invasive studies of actual neurons and connections in animals. Various researchers can then attempt to deduce how these excitations give rise to the conscious experience, e.g. by the activities of certain frequency bands, such as gamma from 30-100 Hz.

The classical deterministic view of brain function, denying a role for subjective consciousness and making free will impossible, is undermined by two additional factors in the physics of brain function. The first is edge-of-chaos dynamics, which at tipping point instabilities associated with critical decision-making watersheds can enable a fractal handshaking between instabilities at the quantum level of the ion channel and changes in overall brain state. The second is the intrinsic uncertainty of quantum events and their entanglement, which is closely paralleled by phase coherence in wave processing associated with coherent conscious states – that brain states which rise and fall together in synch rise to consciousness while others constitute the unconscious ground of neurodynamic processing.

The trouble with the entire sweep of the objective description of brain dynamics is that no objective state, no matter how the brain does it, even if by edge-of-chaos instability and quantum entanglement, is anything other than objective, so it never solves the question of how subjective states actually arise. This is the so-called 'hard problem of consciousness' coined by David Chalmers (1995). Essentially, there is no way to get a ghost out of the objective biological machine of the brain by combining non-conscious components, whether molecules, neuronal excitations, edge of chaos dynamics, quantum phenomena or brain states, if none of these components have any subjective status.

The sceptical basis of the scientific description depends on Occam's razor, the idea that, given two views describing the same phenomenon, the simplest, most concise one is likely to be correct. Materialists thus try to claim that any reference to consciousness and volitional will is extraneous in a supposedly classical macroscopic world where causal decision making processes defined by brain function can in principle have a detailed mechanistic basis without reference to fuzzy vitalistic⁸⁵ notions like mind, consciousness or will. They will then claim the hard problem is a distraction to be finessed away in steps, as more discoveries of how the physical brain processes information become revealed. However the materialist case is not established and it isn't necessarily fulfilling Occam's razor at all. What has happened is that materialists have restricted the domain of evidence to be circumstantial physical fact, ignoring veridical truths stated by conscious observers and actors as mere personal opinions or beliefs, in fundamental conflict with legal situations, where sworn subjective testimony is evidential in the absence of contrivance.

For example Erwin Schrödinger's statement "the overall number of minds is just one", which coincides with the conclusions of this monograph, is discounted as just being his idiosyncratic belief in Advaita Vedanta, despite that fact that we depend on his wave equation to understand quantum chemistry, and his devising of the cat paradox to understand quantum observation. Taken at face value, this is a veridical teaching by a founder of quantum mechanics.

So we need to take a big step back and reassess the way Occam's razor best cuts a real swathe through existence. When confronted by a description of reality which denies our subjective consciousness is anything more than an epiphenomenon, and insists that our volitional will to make any sort of autonomous decision at all is a delusion contrived by evolution to ensure we survive and replicate, that debilitates any sense of personal autonomy, responsibility and confidence to act in the real world, we need to make a succinct determination. Should we just accept this is a scientifically proven fact, when the evidence doesn't exist that the brain is a causally-closed deterministic machine and looks increasingly to be a complex, messy claim that may never be confirmed? Or should we take the much simpler concise volitional choice to allow Occam's razor to cut the Gordian knot of this contrived belief that we are helpless automata, and assert that it contradicts our decision-making autonomy, and rule out of hand this fatalistic myth-making? How can we resolve this existential impasse?

The answer is both ridiculously simple and counter-intuitive – to move the elephant in the room – consciousness itself – into a new place on the cosmological chessboard, that of complementing the entire physical universe. This is a direct consequence of affirming volitional will⁸⁶, because will implies the conscious mind affects the physical universe

⁸⁵ Vitalism is the belief that "living organisms are fundamentally different from non-living entities because they contain some non-physical element or are governed by different principles than are inanimate things". Where vitalism explicitly invokes a vital principle, that element is often referred to as the "vital spark", "energy" or "élan vital", the vital force or impulse of life, a creative principle held by Bergson to be immanent in all organisms and responsible for evolution, which some equate with the soul.

⁸⁶ Arthur Schopenhauer concluded that the inner reality of all material appearances is Will. Where Immanuel Kant had concluded that ultimate reality - the "thing-in-itself" (Ding an sich) - lay beyond being experienced, Schopenhauer postulated that the ultimate reality is one universal will.

physically in terms of the forces of nature. This may be in the way the brain processes unstable tipping points, and may involve quantum phenomena akin to solid state physics, but it is still a physical process following the forces of nature under the [core model](#) of physics. But this means the physics of the universe itself is sensitive to mind and that mind plays an essential role in intentionality⁸⁷ in the universe, manifest in the biosphere as a whole and in the universe at large. This is then a form of pan-psyche cosmology. [Panpsychism](#) is thus the clean veridical Occam's razor cut.

Consciousness, as an expression of a more generalised pan-psyche, then has a role in quantum uncertainty and in collapsing the wave functions of the multiverse, as we see in [Schrödinger's cat paradox](#), which we know appears to be specifically associated with conscious measurement of the wave function. This gives us back both subjective consciousness and its ability to autonomously apply free will in the same process determining the course of history in the universal wave function. This solves the dilemma of science denying free conscious choice and gives us full freedom as sentient beings, unlike the bondage of moral religions, where we are given free will only to find that if we use it autonomously on our own best judgment, we would be likely to end up in hell. Instead of moral compulsion, giving us back autonomy also gives us subjective divinity in our union with the cosmic mind.

This solves the moral problem another way by showing us that our mortal existence is part of the immortal web of life and that there is no future in selfish activity because when we come to the end of our lives, any activities other than giving our all to life as a whole is futile. It also solves the problem for divinity i.e. the mind at large, because now it has a sentiently intelligent vehicle for conscious manifestation.

Since we are universally subjectively sentient conscious beings and have no knowledge of the physical world except through subjective consciousness, the only valid conclusion is that the subjective aspect is a cosmological property complementing the objective physical universe. This means a form of panpsychism, in which all quantum phenomena also have a complementary aspect. This seems counterintuitive, because we seem to be replacing a succinct objective description with something elusive and fuzzy, but that is because we aren't making the right test. The test of objective cosmology is empirical investigation. The test of subjective cosmology is veridical affirmation in which each conscious observer affirms verification.

There are alongside its foundational subjectivity a number of features of our conscious experience which 'colour' the nature of experience and are features or 'qualia' of our consciousness rather than its existential status. For example vision and hearing, smell and touch all differ qualitatively. These differences are partly due to the quantum modes of the senses and partly to do with the neuroreceptors and cerebral excitations eliciting conscious states. So we need to factor these out when addressing panpsychism and the ground roots of subjectivity.

However there are some features in the conscious brain that are clearly universal and hold the key to understanding what consciousness is and how it arises. While individual details of brain structure and dynamics are shared extensively with other mammals, leading to our empathy with our pets, the differences between us and arthropods and molluscs such as cephalopods are much more exotic and somewhat alien.

The fundamental basis of consciousness arises in coordinated edge-of-chaos [membrane excitability](#) in prokaryote cells, dating back to the first cells of our last universal common ancestor LUCA. However a key transition point to sentient consciousness arose in our last eucaryote common ancestor LECA, the founding single celled eucaryote. Here is the transition point where symbiotic cosmology really begins to kick in. This was a hugely significant event in the form of a [deep symbiosis](#) between the two existing prokaryote kingdoms some 2 billion years ago, in which an Asgard archaeon and a proteobacterium, similar to our intestinal bacterium *Escherichia coli*, became symbiotically interdependent. This freed the cell membrane from core energy processing, which was now handled by the bacterial mitochondrial respiration and made the new cell membrane able to become focussed on information processing. This meant that the eucaryote cell became sentient life form responding to quantum modes – sight, sound, chemical and electrical, in its environment sensitively due to the edge-of-chaos dynamics of its excitable membrane. At the same time these cells, across the board use the same molecules as the key repertoire of our [neurotransmitters](#) to facilitate the social signalling essential for survival of the collective single celled organism.

⁸⁷ **intentionality** – the fact of being deliberate or purposive. mental states (e.g. thoughts, beliefs, desires, hopes) which consists in their being directed towards some object or state of affairs. **Intentionality** is chosen rather than **causality** to include the effect of will complementing physical causes.

This is the point where panpsychism becomes consciousness as we know it and the entire rest of the story is simply elaborating on this theme, so the human brain ends up being a very ornately and closely coupled collection of amoebae communicating through these same social signalling molecules in their synapses to produce the highly coordinated form of cellular consciousness that we experience as subjective reality.

This turns what might seem to be specious vitalism into a clear-cut biological theory in which the development of subjective consciousness has a clear evolutionary trace from the punctuated equilibrium of eucaryote symbiosis, consistent with the physiology of chaotically excitable cells in a quantum entangled universe. Because this subjective product of excitability enhanced survival by avoiding lethal outcomes, it has been selected by evolution throughout. This in turn attests to the effectuality of conscious will on the physical universe

One can then find evidential support for this conclusion. A key point of transition is that from single celled eucaryotes to the metazoa – multicelled animals. A highly-studied example is the myxamoeban slime-mould *Dictyostelium discoideum*. This is a free-living single-celled amoeba that having eaten out its local bacterial habitat, aggregates, forming an excitable slug and then a sporulating fruiting body, to spread it to new habitats. It does this by using a combination of the same molecules that we use as neurotransmitters and second-signalling molecules – cyclic AMP, glutamate, GABA and serotonin pivotal to psychedelic activity and human mood. It turns out that an interplay between serotonin and its catabolic enzyme MAOa is key to maintaining development of the spore-forming tip of the fruiting body. In the same way, serotonin plays a key role not just in neurotransmission in the mature brain but evoking stages of brain development in the human embryo, for the neural groove at one extreme, to coordinating the correct formation of the layers of other neurons in the cerebral cortex, through serotonin-secreting fibres ascending from the basal brain that are later used in the moderating mood in the mature brain, to mediate organismic social survival.

Several of these molecules are primal in their simplicity and cosmological in their origin. Both glutamate and GABA both of which are key neurotransmitters are prominent components of comets and carbonaceous chondrites. Others are the amines of biological amino acids. Serotonin is 5-hydroxy-tryptamine, derived from tryptophan.

This goes a good way toward providing an immediate explanation of how psychedelics can cause a retreat from egotistical attentive consciousness into a primary consciousness, in which ego loss occurs, consistent with an underlying dynamic to secure collective survival, rather than personal survival of the individual, when the psychedelic state dissolves the distinction between self and other in a peak experience.

But the eucaryote symbiosis is not the only manifestation of symbiosis in *Homo sapiens*. As far as we know, all existing eucaryotes are sexual, or at least capable of intermittent (cryptic) sexuality. Dyadic sex is one of the most altruistic genetic acts an organism can commit to, by giving only half its genes, along with half the partners genes to make what is essentially a new life form never before conceived. All sexual species thus consist of two sexes each with their own genetic history (or more – *Dictyostelium* has three and some fungi fertilising by conjugation lots more). Sexual symbiosis in animals is highly asymmetric with the female contributing all the cytoplasm, ostensibly to avoid a mitochondrial genetic war, and the males contributing essentially only their DNA in the sperm, giving rise to sexually antagonistic co-evolution i.e. the sex wars of reproductive investment.

Humans are also extensively symbiotic with their endogenous transposable elements, which constitute over half of the human chromosomal genome, that arose originally as selfish genes, co-travellers that run back to the first multicelled animals and retroviruses related to HIV that became incorporated into our germ lines. These can cause mutations but also have key roles in coordinated gene expression and chromosomal processing.

Finally all species are co-dependent with the other species populating their ecological niches in biospheric symbiosis. This is what we capitalistically call survival of the fittest by natural selection, but really it is symbiotic co-evolution with the biosphere as a whole, even though individual species, including *Homo sapiens* have evolved to maintain strategic survival in their own right, leading to the egotistical expression of human character.

In the context of humanity, we are manifestly symbiotic with our food and medicinal species and likewise with our entheogenic species. The plant components of ayahuasca, the opium poppy, cannabis, coca and the herb of the shepherdess, *Salvia divinorum* have all been symbiotic with the human species for millennia, as has the yeast *Saccharomyces cerevisiae* responsible for bread, but also alcohol. Peyote and sacred mushrooms have been collected

from the wild for millennia but some species of Psilocybe mushrooms are the most easily cultivated entheogens, now in symbiotic use.

This brings us to the final component of the symbiotic universe, symbiosis with the mind at large. Humans consider ourselves to be the species that invented culture. We tend to define ourselves as reaching to the stars themselves, as a dominant species that stoops to no other, as the highest form of consciousness, apart from God himself and thus free to determine the destiny of all living species on Earth. This is a tragic fallacy in conflict with all the evidence.

Human attempts to seek moksha – escape from the egotistical and mortal round of birth and death are singularly rare enough that the Eastern traditions of both Buddhism and Vedanta have arrived at a fallacious notion of enlightenment through many reincarnations, essentially because the experience of cosmic reunion is so rare as to be essentially unattainable. The monotheistic faiths have abandoned any hint of such achievement. Christianity considers human nature fatally flawed by original sin and hence the only hope is faith in God, prayer and fear of the punishments of Hell in the day of judgment, while mystical experiences are rare and generally contemplative, rather than illuminative. Any idea that a person can manifest actual identity with God is blasphemous across all monotheistic paths. Islam regards it as a death penalty, just as Yeshua was condemned to death by the High Priests for blasphemy.

This leads to the conclusion that human consciousness is not the cosmological pinnacle of conscious existence, but we are a/the key active vehicle for cosmological symbiosis incarnate, and that the entheogenic state, by virtue of the very symbiosis induced by the entheogenic relationship takes us closer to the union with the mind at large that is the consummating manifestation of the cosmos in self-awareness. The biota are the only entities we know of in the universe that possess consciousness. They are thus the central candidates for the interactive emergence of cosmological consciousness from the Big Bang. This experience of union is also the only phenomenon we know of that comes anywhere close to the actual realisation of deity.

This finally solves the dilemma of God as a third agent outside the physical universe. The missing component explaining the creation of the observable universe is not God but consciousness itself. It is the missing piece in the puzzle and the manifestation of deity is thus realised in the subjective, not in a miraculous third party.

And although it seems counterintuitive to think that consuming entheogenic species is a/the key to saving the planet, there is a symbiotic truth in this because, the entheogenic relationship in [Maria Sabina's](#) words a way of “the sap and the dew” heightens our deep sense of inter-connecteness with nature and deep solace in our relationship with life as a whole, rather than delusory and damaging supremacy over it that leaves us in mortal isolation, so in the longer evolutionary time scale, given the current biospheric dominance of *Homo sapiens*, this is cosmologically pivotal.

A Visionary Journey

The other side of the coin of this transmission is that I am what I would call a true visionary. That is, I am transparent and simply give you the keys to resolve the existential enigma to use for yourself. I have no doctrine about what other people need to do spiritually, or should do to gain illumination and I am true to the pursuit of the vision quest. I don't follow any religion and don't ask anyone to believe in me, but I encourage you to find out for yourselves with an open mind. And to ensure everyone has love and support to keep the process tranquil. The reason is that the cure for the mortal condition is moksha not moral punishment and moksha heals and informs the ego. The true realities that matter to the meaning of sentient existence in the mortal coil are not found in the material world, but in accepting our transience within the eternal entanglement and realising that the only meaningful acts we can perform are to ensure the passage of the living generations continues to flourish. Therefore true enlightenment redeems the mortal condition. I have sourced my vital inspiration and literally navigated my life course through first person visionary experiences on entheogenic species that have propelled my life and its urgency and activism.

The intensity of these experiences could have consumed me and driven the most stalwart to the brink of messianic insanity, were it not for my intent to be true to nature and the universe at large, as well as my loved ones. I may have no religious or spiritual assumptions, or doctrine, but I do have one clear natural priority *sine qua non* and that is a mandate to save the living planet, its biodiversity and its largely beneficent, nurturing climate from a hard landing, irreversible tipping points, a mass extinction of life which would place our living future and the future of all life in serious jeopardy.

I was born in 1945, just as the first plutonium for Nagasaki rolled out of Hanford – on 6th Jan – the Epiphany of the advent, appearance and miraculous dread of Dionysus, who became Dhushara of the Nabateans in Yeshua's time. This event later became usurped by Hellenistic-Jewish gospel writers as Yeshua's Triple Epiphany: (1) of his visitation by the Magi, (2) in his baptism by John and (3) in his turning water into wine at Cana at the request of his mother, in an all-too Dionysian display of the god of wine and altered states.

Fig 250: Left: Dionysus mask Centre left: Dionysus mosaic Dion 300 BCE – 300 CE. Centre: Quetzalcoatl in human form. Centre right Teotihuacan 150-200 CE, Olmec la Venta 900 BCE. Quetzalcoatl is the god of wisdom, whose feathers represent the flight of visionary consciousness, while the serpentine body slithers among the plants and animals, entangled in natural existence.

The “feathery part” of my vision quest is summed up in “The Plumed Serpent” (Lawrence 1974):

*"I am lord of two ways. I am master of up and down.
I am as a man who is a new man, with new limbs and life,
and the light of the Morning Star in his eyes.
Lo! I am! The lord of both ways.
Thou wert lord of the one way.
Now it leads thee to the sleep. Farewell!
So Jesus went on towards the sleep.*

*And Mary the Mother of Sorrows lay down
on the bed of the white moon,
weary beyond any more tears.
"And I, I am on the threshold.
I am stepping across the border.
I am Quetzalcoatl lord of both ways,
star between day and the dark."*

I was christened Christopher Cyril King, but I don't answer to Christopher and I am not a cross-bearer. I won't carry a cross for anyone, or stand in anyone's shadow, least of all a dying and resurrecting saviour, who I admire as a brilliant innovator, but also lament for his self-destructive heritage of violence. We each come from a three billion year line of evolution, that has honed us to be conscious beings taking responsibility for our own lives and futures, so I have honed my vision quest as a journey – the trip of a lifetime – the trip of all trips together, till death us do part!

For those of us seeking psychic phenomena from visionary experiences, I've had these too, although, while they do affect my world view, I neither take any of these for granted and consider them deeply natural rather than supernatural.

I have had repeated precognitive dreams and precognitive creative experiences. When I was living on a canal boat we built in England, I read J W Dunne's (1934) "An Experiment with Time". According to Dunne, our wakeful attention prevents us from seeing beyond the present moment, whilst when dreaming that attention fades and we gain the ability to recall more of our timeline. This allows fragments of our future to appear in pre-cognitive dreams, mixed in with fragments or memories of our past. Other consequences include the phenomenon known as deja vu and life after death. At the time of its publication, not to have read him became a "mark of singularity" in society.

Fig 251: The Taniwha (Maori spirit of the rivers and swamps), the canal boat we built from a wreck submerged since the 19th century where the dream took place.

Shortly after this I had a double nightmare that I was being hideously stung by a spider, repeated in the second dream because I had failed to brush it off when it had removed its fangs. I continued to sleep in after Hallie, my young wife, got up to feed our first child, a newborn baby girl, opening the bedroom window in the process. I woke long enough to tell her "I had a terrible double nightmare" and then fell asleep again.

About an hour later, I was stung wide awake by a wasp that had flown in after she opened the window, going through all the same feverish motions under the intense pain I had experienced in the dream, blowing it off to find it was a large wasp. I have had many such dreams during my life most often anticipating things that unexpectedly happen early the next day. What it has taught me is that the universe is an entangled handshaking in which past, present and future are intertwined, and that the role of conscious existence is partly to anticipate future threats and challenges through direct perception of the space-time continuum.

I have also had lucid dreams combined with out of the body experiences. After practicing looking at the backs of my hands in dreams and after having dreams in which I was climbing a ladder and saw my hands but failed to respond, I suddenly realised in my first lucid dreaming encounter that I was fully aware in my dream and all hell broke loose. Firstly, I was being thrust up faster and faster like a rocket ship, in the manner of levitating and flying dreams. But I was also standing in the dream on an exceedingly bright promenade by the sea. A gust of wind that was also the levitating wind blew some sea spray at my light muslin Indian shirt. I was in a super-sensory state. I could simultaneously sense every one of the droplets separately touching my skin like the stars in the sky. But that didn't concern me. I looked up at the azure sky and the stratospheric clouds passing overhead and realised I was trapped in another world – in another universe. I saw a woman standing gazing at me with dark eyes and rushed towards her, grabbing her by both shoulders staring deeply down into her wild wide pupils, framing the silent urgent question where is the way back to Ixtalan echoing Carlos Castaneda's (1972) allegories⁸⁸ of the sorcerer Don Juan. She just looked at me and smiled knowingly and shook her head. But at the same time, I was out of my body floating just by the ceiling of my bedroom looking down at myself lying on the bed, totally reassured: "It's all okay! You are just down there sleeping". I thus awoke with three parallel streams of consciousness re-entwining together. Again, I have had many lucid dreams, but none so graphic as this first experience. I have had many lucid dreams but none so graphic as this first experience.

The difficulty with lucid dreaming is that the very act of becoming lucid rapidly tends to cause one to awaken because the triggers in the base of the brain flip towards wakefulness the moment we become lucid because neurotransmitters for vigilance such as nor-epinephrine kick in and flip the orexin neurons to wake the brain up. This is different from the visionary experiences induced by entheogenic species where a waking person can descend into a deep visionary abyss where other realities quite distinct from dreaming can occur, although returning from the depths of these other states can leave on in a similar situation of trying to recall the ineffable that has now receded, as Don Hose Matsuwa the Huichol shaman [makes clear](#).

This brings us to [psychedelics](#), or entheogens as the natural species are called, that possess psychedelic substances and are used, and have been used [for millennia](#) as visionary sacraments for healing, sorcery and spiritual realisation.

My relationship with psychedelic agents began as soon as I arrived in the UK to take a graduate mathematics degree in topology, with my first somewhat devastating experiences on LSD, still decanted with a dropper onto whole sugar cubes. The first trip was really awesome, but a week later a double dose of two cubes left me with the absolute certainty I had literally died (the most extreme form of ego death) and left me with shimmering after effects for weeks. At the same time, orchestrated by the US drug authorities, contrived reports were circulated that LSD split your chromosomes, which left me with five years of anxiety before I would take my next trip.

After that began a regular round of recreational tripping to try to get to the bottom of what these agents were showing us. I have always been devoted to my family which has now become a loving and caring extended *whanau* as relationships between partners have evolved and changed. For several years we held court, hosting a free-love establishment in the city, in which I ended up in three double partnerships in open 'marriages', spanning decades. Attesting to my consistency, I have lived with my current partner, Christine for over 50 years, despite times apart on world journeys, and all my offspring and grand children are nearby, so I must be doing something right, in spite of all.

⁸⁸ No not take too much stock by Castaneda's writings. His accounts of mushrooms and peyote are unreliable and he gathered a cult following of a troupe of woman writers, who appear to have [died or committed suicide](#) in Death Valley after he died.

On my first academic sabbatical, I split my efforts between a scientific investigation in the West to get first hand knowledge of what some of the famous scientists, including Nobel prize winners, made of the role of life in the universe. I spent the rest of my time imbibing the Eastern spiritual traditions, wandering India as a sadhu and taking Tibetan Buddhist initiations with Yeshe Dorje the Ningmapa exorcist who kept the rain off the Dalai Lama when he walked and Rangjung Rigpe Dorje the 16th Karmapa the head of the Karma Kagyu lineage, at the same time exploring sources of the world's power plants, from the poppy fields of the Golden Triangle, through the Ganga fields of India and Afghanistan, eventually to take peyote with the Native American Church in New Mexico, where I also encountered my first sacred mushroom experience.

On my return to Aotearoa, I began a symbiotic relationship with sacred mushrooms, both because of their genetic purity, by comparison with synthetic drugs and because, although not as overpowering as LSD, they provide, in my view, a more deeply spiritual experience, which is also a deep expression of conscious symbiosis, without some of the transient casualties of LSD trips that occurred among our friends. This doesn't mean taking mushrooms all the time. In fact I will sometimes go for years simply making sure they survive. Symbiosis means being faithful to their preservation. Their spores will live for decades if correctly stored at 5% humidity in a cool place and they can be cultivated in a chilly bin, with careful sterile techniques. I also brought species recognition to *psilocybe aucklandii*, and conserve a collection of species spanning each of the classic enthenogens, to safeguard the visionary heritage for humanity, as a symbiotic duty of care.

Fig 252: A panorama of Opuhi, our wilderness land in Aotearoa. The meeting house is just visible on the right up the path.

In 1970 we had established a windswept coastal wilderness conservation community, which provided endless opportunities to hold mushroom veladas in the moonlight, listening to the crickets and moreporks and the distant ocean below, either alone, in "solitario", which I prefer, or together in the meeting house, which has since become a heritage building. These experiences have become pivotal to my life's work.

Other waking experiences, both on sacred mushrooms and during creative experiences have assumed a prophetic quality that can be alarming or even devastating. On one particular velada in the 1980s I suddenly became aware that the mushroom was telling me that if the world failed to show adequate signs of arresting the human impact causing a mass extinction of living diversity, I would need to make a vision quest to the Amazon, as our figurative Garden of Eden paradise and to Yerushalayim as the nexus of the religious impulse to undertake a rite of passage to make a transition to the immortal epoch of the Tree of Life, hidden since the foundation of the world in Eden by a flaming sword. Around the same time on another trip, I had a horrific vision that my eldest daughter would have an obstruction to her fertility, as some twisted kind of sacrificial outcome of my undertaking this mission. Some years later she became pregnant and her first of three sons was born with Down syndrome. He is great, but the episode was very disturbing, and a triple chromosome 21 is a genetic obstruction to fertility, affirming the vision's veridical, or prophetic character.

In 1980 I made a second journey on unpaid leave to research the chemical origins of life in the US, later returning to Mexico and collecting and consuming peyote from the high desert below Wirikuta, the sacred mountain of the Huichol and then travelling to Yarinacocha lagoon at Pucallpa in Peru, where I took a powerful and formative ayahuasca trip with Snr. Trinico, a leprous curandero living at the extreme end of the slums around the lagoon. In 1992 I again returned on sabbatical and took peyote with the Native American Church in Taos with Tellus Goodmorning, my original roadman who was 92 and had lost one eye, but was still in fighting form chanting all night in the teepee.

In the two years spanning the millennium I made another sabbatical journey to the Amazon to document one of the worst burning seasons on record and returned to Yarinacocha for a second ayahuasca session with Trinico who was elderly, but now in good health.

Following this, with my sabbatical partner Jane King, we completed our [Millennial vigil to Jerusalem](#), pronouncing as Bride and Bridegroom the rite of passage of the of the immortal Tree of Life of living diversity in the Gaia anointing of

the Jubilee passage of Isaiah 61, completed on the Epiphany by declaring the Gates of Mercy open at the Eastern wall and celebrating the Sacred Reunion of woman and man in the Song of Songs at the Western (Wailing) Wall.

This served two key purposes to address foundation issues in the collective unconscious, manifest in the Weltanschauung⁸⁹, the archaic formative world view driving patriarchal monotheism expressed in the Yahwistic Genesis, **firstly** in Eve being cursed for heeding the serpent, to be obedient to her husband under pain of childbirth, appeasing male paternity uncertainty, confessing an archaic conflict with the matriline and female reproductive integrity and **secondly** with dominion over nature, in the Tree of Life in Paradise hidden from humanity behind a flaming sword, dooming us to conflict with the thorns of the wilderness sweat of human dominance.

In 2015 I had a near-death experience when involved in a cycle accident which knocked me unconscious and left me with temporary amnesia from ensuing concussion. This made me acutely aware of the risks I was taking not fulfilling the pact with the mushroom, by kicking the bucket before my time had come. This resulted in the notion of planetary resplendence transcending religion as a way of life protecting the biosphere in perpetuity. Resurrection Revelation Finally after a seven year hiatus, I took the mushroom trip that became this entire work.

On 19-7-2001, a month before 9-11, I published the lyrics of a song I had composed – Big Brother – The Song of the Biosphere – video. This was a poetic statement having read an AP news article “The Hollywood Syndrome - Is the US the Global Satan?”, concerning the failure of G W Bush to ratify the Kyoto convention. The article was well conceived and the song is a just response. The lyrics took this statement and declared poetic jihad for the biosphere. ‘When it comes to the final struggle, jihad of the biosphere, there’s only one true rogue nation - the great American shaitan - Big Brother you are uncle Sam’, because George H W Bush had refused to sign the 1992 Rio Convention on Biodiversity. (As of 2016, the convention has 196 parties. All UN member states – with the exception of the United States – have ratified the treaty. The US still only has observer status as I write this in 2022, 30 years later!). The lyrics continue with a lament for the dark canyons of lower Manhattan among the fallen towers: ‘walking in the twilight, down in the valley of shadows’, and then the plane: ‘We’ll fly so high well pass right to the other side and never fall in flames again’.

Just under two months later, at one in the morning on a continuous BBC news broadcast, I watched in horror, as firstly one and then two planes crashed through the twin towers of the World Trade Center in flames and the towers fell, turning the streets of lower Manhattan into a literal vale of the shadow of death.

Fig 253: A: Extracts from the lyrics posting of 20th July 2001 (<http://dhushara.com/nino/19julyjihad.jpg>). B: Passenger plane collides with one of the twin towers. C: Rudi Giuliani Mayor of New York the number of casualties will be more than any of us can bear (<http://youtu.be/xhBYWDy4m9M>). For the complete song video containing the 9-11 documentary footage, see: (http://youtu.be/g-giqTW4_YQ).

The lyrics contain an uncanny ‘prophetic’ reverse echo of the event a month before it occurred:

First we have the jihad against the U.S. over the Rio biodiversity convention, but now it has really become Islamic fundamentalism on 9-11:

*you tell us tales of hollywood of star wars and the common good
you told us global warming was a litany of lies, factory chimneys were the prize
you claim all living creatures are your intellectual property
you fail to ratify every treaty which doesn't give you more, have I heard this all before?*

⁸⁹ *Weltanschauung* – a particular philosophy or view of life; the world view of an individual or group: *welt* "world" (see world) + *anschauung* "perception" (related to English show). William James (1868)

*when it comes to the final struggle - jihad of the biosphere
there's only one true rogue nation - the great American shaitan*

This was karma, not a rude invention. The first line is “hollywood” and the last is the American satan just as in the AP article. Next we have an echo of the streets of New York amid the smoke and haze of fallen masonry amid a massacre:

*walking in the twilight, down in the valley of shadows
when will you comprehend - the damage you have wrought in your indiscretion?
can we undo - the death trance you have set in motion?*

Then the amazing, outstanding, caring efforts of those on the ground, to begin the process of recovery:

*will you discover - the fabric of love that ignites us?
can we embrace the ocean of life that unites us?
all our lives long this journey has been our destination
if we get this one wrong will there be any chance for restoration*

We have the planes flying clean through the towers in flames reminiscent of a martyr seeking the face of God:

*can we touch the sky?
can we fly so high we'll pass right to the other side
and never fall in flames? will we ever be the same again?*

To become the primal source and shining goal:

*we'll become the living soul, the primal source, the shining goal
the beginning and the end of life,*

Finally, a shadow of Rudy Giuliani’s statement as Mayor: The “casualties will be more than any of us can bear”:

the happiness and the pain ... can we bear it all again?

I apologise to all Americans for comparing your country to the Shaitan, but saving biodiversity is saving ourselves. Refusing to sign the Rio Convention on Biological Diversity is counter to the entire planetary future, so it **was/is** satanic, just as Donald Trump’s pulling out of the Paris accord **was** satanic. These are not the acts of a responsible superpower.

So what are we supposed to make of this? It’s just a coincidence isn’t it? There is more to this tale caught up in the quantum entanglement of past, present and future. It’s a completely non-replicable non-IID event. Is it a coincidence? What’s the probability of that? My father used to marvel at coincidence, repeatedly astounded.

How come, a month or more before 9-11 did I get it into my head to write these lines? Yes it's the same life-protecting motive that brought the SEC into existence. But no one remotely conceived this was going to happen. The lyrics are an allegory not conceived to be literal future fact, just poetry, but they are nevertheless written from an apocalyptic viewpoint. But they are also a stream of consciousness account of everybody and everything that happened. The minds of the martyrs thinking they'll fly so high they'll pass right to the other side and it's also the consciousness of the people who went in to deal with the destruction in the smoke and dust of Manhattan's dark corridors and the spirit of those who came to light their candles for life and the uncanny "can we bear it all again?" whose words Giuliani echoed on TV.

In the above account we have the following items:

- (1) Jihad declared against the great American satan – echoing 9-11 full on.
- (2) Flying so high we’ll pass right to the other side and never fall in flames
– echoing the planes passing right through the twin WTC towers.
- (3) we'll become the living soul, the primal source, the shining goal, the beginning and the end of life
– echoing martyrdom
- (4) the valley of shadows, the damage wrought and the death trance you have set in motion – the aftermath
- (5) The fabric of love that unites us – the candles and helpers risking their lives at ground zero
- (6) The pain, can we bear it all again? – echoing NY mayor Giuliani “this will be more than we can bear”

If we say each has a 1 in 10 chance of appearing randomly, then all appearing together in one situation gives 1 in 10⁶ i.e. a one in million chance of happening randomly.

In Plato's allegory of the cave, our state of knowledge is like that of prisoners chained together in a cave watching an illusory drama. Behind the prisoners is a fire, and between the fire and the prisoners are people carrying puppets or other objects, casting shadows on the cave wall. The prisoners watch these shadows, believing them to be real. One prisoner finally sees the fire and realises the shadows are fake. This prisoner escapes from the cave and discovers there is a whole new world outside that they were previously unaware of, but he becomes blinded because his eyes are not accustomed to actual sunlight, so when he returns to free them, his fellows do not trust his new knowledge.

Ruth Kastner has coined the analogy that quantum land hiding in the [transactional interpretation](#) of quantum mechanics, connecting all the potential absorbers to the emitter determining how quantum reality manifests, is the real reality and that physical reality we see in space-time is just the false image on the wall of Plato's cave. I have a different view of this which I'll describe, but Ruth's view has true reality value in suggesting that the foundations of consciousness lie outside physical space-time in the quantum land of incipient possibilities she calls *potentiae*. In a fundamental sense, this gives a true account of consciousness as the primary reality underlying the necessity of the physical universe, as the consensual illusion that binds together our conscious experiences of the world at large.

My view of this goes as follows:

Firstly 100% of people are subjectively conscious human beings, all of whose understanding of the physical universe has come from their conscious experiences, while only a subset believe in physical causality.

Secondly our experience of conscious volition is that we have autonomous intent and can perceive this intent veridically being manifest in our intentional actions. Therefore the physicalist description which sees consciousness as a mere internal model and volition as non-existent is empirically false.

Thirdly our conscious experience of volition is not like Plato's cave, because we are not passively watching a movie allegory, we are participating in it. The intervention of conscious volition is what actually causes history to emerge from the multiverse, so we are right there by the fire manipulating the images cast on the cave wall. To do this effectively we have to do it predictively.

One of the most central aspects of consciousness is that it is an extended space-time representation of our dynamical relationship with existence on an uncertain trajectory from the immediate past into the uncertain future. This looks convincingly like an entangled quantum representation of the now, i.e. the absolute instant of the present expanded into both the immediate past and immediate future – i.e. the uncertain quantum of the present. When this becomes extended as in the above example of 9-11 which is a strongly felt apocalypse in my vision that is going to become a world apocalypse in everyone's experience the two get caught in a Faustian space-time pact.

To a certain extent our relationship with time is a little like Plato's cave in the sense that the future is harder to see and we are stuck with the past in all our memories, dreams and reflections as Jung said. But this isn't the whole story. The brain-mind is a dynamical predictor as flash-lag illusions show it doing creating space-time artefacts. We experience this facing forwards into the unknown using consciousness as our cubic centimetre of chance to address uncertainty, so my bet is that consciousness is space-time transactionally predictive and has to be for evolution to retain it over a purely physical computational brain.

For consciousness to have any affect on physical outcomes that is useful to evolution, it has to be able to anticipate reality. The mind can do this logically or intuitively. But for conscious intuition to do it, it has to be in a sense precognitive (Bem 2012, Bem et al. 2016).

What about life immortality and the eternal? is the "ground" of consciousness a universal subjective phenomenon? If so, is it itself in any way connected to the death of the brain. The answer to this is probably yes, because the brain, at the very least is an immensely complex defining condition on the way human organismic consciousness manifests subjectively. This is where a scientist's comment – the brain "makes" consciousness is largely correct, even if the brain is not causally closed, so that conscious volition is efficacious physically.

But subjective conscious ground of being as a universal phenomenon is then something that is not confined to a mortal organism's lifetime. In fact it is not even confined to biological evolutionary immortality, so it stands as a principal candidate for being eternal or existing outside space-time, as space-time is an entirely physical construct.

So where does this leave us? Well, religious people, Psi people and reincarnation people and mediums all have to reconsider all monolithic assumptions about the afterlife. At the same time scientific materialists need to recognise consciousness is cosmological and stop insisting our conscious volition is just a product of the computational brain.

Frankly I think biological mortality is the key to conscious existence sine qua non, because it's the only way complex conscious existence can become physically manifest in sexual evolution. This is the incarnate focal point of conscious existence. I want to be effectual in my biological existence. I can already experience the immortality of evolving life and the eternal nature of the ground of conscious being and the so called spirit world of disembodied consciousness.

My take on this other world is entirely different from any other description of it I have seen in scripture, mediumistic accounts although is an extension of NDEs – rather as an integral transform of the entire conscious experience of the universe aware of itself, both as the mind at large and as the disembodied entities that constitute it, not some winged angels in “heaven” dancing on the head of a pin and not the tormented in eternal suffering in “hell”.

'Elohim

*We are whispering ... across the heavens and all the creatures ... they echo in reply.
We are the very blood ... of the tree of life. We are the void and the shining light.
We are the eternal gypsy spirits of the universe. We have been here since it all began.
We will outlast its final passing. We are here to free the heart of man.*

Adding further assumptions, in my not-so-humble opinion, leads to all manner of egotistical traps, as serious in the subjective world, as the human desire for cyborg immortality does in the physical universe.

William Shakespeare's Macbeth, in despair at the death of his queen, casts the whole of life as a tale told by an idiot:

*Out, out, brief candle. Life's but a walking shadow, a poor player That struts and frets his hour upon the stage,
And then is heard no more. It is a tale Told by an idiot, full of sound and fury, Signifying nothing.*

This is not the outcome we seek for the living planet, so please listen to the sound and fury of a hallucinogen-consuming voice from the wilderness. It is not me, but the direction human life is taking, and all of us with it, that is

idiotic beyond comprehension. That is a tale full of apocalyptic sound and fury, both religious and biospheric which, far from signifying nothing, might kill us all if we don't accept the **three priorities for reflowering the planet** above.

To quote Yeshua from the Gospel of Thomas (70):

*"That which you have will save you if you bring it forth from yourselves.
That which you do not have within you [will] kill you if you do not have it within you."*

Fig 253b: *It won't be easy but we can do this thing.*

Here is my Easter 2023 Revelation!

I don't usually adhere to the Everett interpretation, but as it's a valid QM interpretation, I am entitled to and will also use the transactional special relativistic interpretation. So I'm going to assert the following:

- (1) The objective universe, outside subjectivity, is a probability multiverse and on its own, no wave function collapse takes place, and everything remains “entangled”.

- (2) This applies also to the unconscious aspects of brain function, which proceed on a multiverse Schrödinger wave equation basis forming "massively" superimposed and entangled states.
- (3) Subjective conscious volition over the physical universe then collapses these brain wave states in the process of decision-making, to form a predictive form of quantum anticipation, due to the special relativistic nature of the wave functions, involving both causal and retro-causal interactions, via the transactional interpretation, or a super-determinism in which free will exists, and the hidden variables are context dependent on observation, and are not simply random.
- (4) To be effective over a non-conscious zombie, subjective consciousness still has to be predictive, to secure natural selection, so subjectivity is and has to be quantum anticipative or "predictive" through (3).
- (5) The reason consciousness has been conserved by evolution is thus that environmental uncertainty is uncomputable because it involves both (a) intractable "travelling salesman" problems (b) multiple possible outcomes and most acutely (c) interaction with other live conscious agents, which also possess conscious volitional anticipation.
- (6) This takes the form of a Red Queen evolutionary race between conscious predators and prey like the way sexuality evolved as a Red Queen genetic race between parasites and hosts by providing individual variation and avoiding epidemic species extinctions, but ironically resulting in organismic mortality.
- (7) This makes a clean cut cosmologically: All unconscious processes are type 2 von Neumann QM multiverses, but all conscious experiences are type 1 anticipatory collapse processes, which ironically make the universe look "classical" to us. In turn, this means that subjective consciousness as we know it, is and is exclusively to anticipate uncertainty, complementing the role of neural computation to infer a certain or uncertain outcome and subjective conscious volition is then "free will" over the uncertain universe with no causal conflict.
- (8) This process is cosmological, not simply neuroscientific, and it is integral to the cosmic symmetry-breaking which defined the asymmetric standard model of physics, leading to conscious life in "Paradise" on the cosmic equator in space-time. The late emergence is necessary because the cosmological interactive process takes 10 billion years to become physically viable, not because consciousness is a "late comer".
- (9) This means that there is no such thing as random uncertainty. All contextual and environmental uncertainty is a result of chaotic quantum molecular billiards which remains entangled until the moment of conscious observation. Hence karma, IS quantum uncertainty revealed, not a moral nightmare!
- (10) This also means subjective consciousness is creative, innovative and transformative i.e. transcendent over the physical universe.

Fig 292: Opuhi AGM 2023, the meeting house and the wind-swept puriri tree outside.

My visit to Opuhi, sleeping overnight at the summit with Christine reminded me of just how deluded these statements are, so I decided to explain to you all and the world at large just what Resplendence means to me, as the natural successor to religion – illuminating in autonomous visionary liberation, rather than binding by prescriptive spiritual belief.

If you read these thirteen points carefully, you will immediately realise these are nothing like any religion that has ever existed on the face of the Earth. It is also a scientific cosmology coming right out of left field that is itself a testament to the mushroom and to the sheer idiosyncrasy of the first person vision quest. Also you will realise that I am so far ahead of the ball that you will all probably disagree with one another about the physics and perhaps only Joshua Davis (2009) can understand the significance of the immediate first person vision. Maybe then you can begin to understand why I have not sought a religious following, or cultic focus but rather have since walked as Laotsu and why I have sought to be a member of these groups in the hope that someone can begin to appreciate the truth and significance of Symbiotic Existential Cosmology as a living redemption of planet Earth and its increasingly vulnerable biospheric diversity of life.

Thirteen Core Principles of Cosmological Resplendence

1. **Cosmos:** Conscious experience and the physical universe are Cosmic complements. Each is necessary to the other's existence and neither are sufficient unto themselves. Subjectivity begins as a primal vestige, complementary to the vestigial emergent universe and emergent in dynamically unstable quantum systems and manifests with the evolving universe. The universe does not begin with God, or from a fully-fledged cosmic consciousness, out of which the material universe is emergent. Neither is it theistically degenerate, heading to an Eschaton, Frashokereti, Kali Yuga or Samvartakalpa, but upward into the light of full illumination that IS resplendence manifest.
2. **Biogenesis:** The central purpose of the Cosmos is to be generative of conscious life. The living universe rises to interactive complexity climax in molecular abiogenesis and the ensuing evolutionary emergence of conscious organisms. The physical universe and the forces of nature form a symmetry-broken interactive "mandala" which generates the elements, the organic molecules of life and the non-linear fractal structures of complex molecules, including proteins and nucleic acids, organelles, cells, tissues and organisms as an interactive climax of cosmology.
3. **Biota:** The living biota are the centre of the existential cyclone of the climax of existence, because we exist at the interface of the physical and the experiential. All experience and manifestation of God(s), spirit beings, etherial or even purely physical phenomena arise through the conscious biota. None stands more pivotally in the cosmological manifestation than the biota and conscious life itself. Eternal consciousness is manifest through and only through the biota. This "worldly" existence IS cosmic existence becoming manifest. There is no greater heaven or hell than biospheric Paradise on the cosmic equator in space-time, mid-life in the history of the universe, as interactive Sigma rather than alpha or Omega as beginning and end states. Temporality and eternity are complementary perspectives. Through manifesting in space-time, consciousness is eternal.
4. **Quantum Reality:** The function of subjective conscious volition over the physical universe is to collapse the wave function of the quantum multiverse to bring about the phenomenon of history out of our multiple potential futures, through the autonomous conscious willing agency of the biota. Conscious experience is complementary to environmental uncertainty, ensuring the survival of the organism, ultimately due to quantum uncertainty in both brain dynamics and the physical universe. Conscious neurodynamics is thus a cosmological manifestation, not just a biological one. We are transformers of the universe and innovators, protectors and creators of the future and need to be prescient, compassionate and protective of the entire universe and all life within it. Subjectivity complements purely objective information processing in the brain, which is computationally insufficient to maintain life in the uncertain natural environment.
5. **Meaning:** The purpose and meaning of conscious life in the universe is so that the Cosmos, and ourselves as organisms, can come to know and realise ourselves ecstatically through each and all of us making the vision quest to discover ultimate nature of reality in upholding and protecting the evolving diversity of life, so that we and the living Cosmos can discover ourselves ever more deeply over cosmic time.
6. **Responsibility:** In coming to experience ultimate reality, we become personally responsible for every aspect of the fate of the universe and all life, both by our constructive, or destructive actions, and our negligence about or protective action to avoid existential threats we know as a species we are causing to the diversity and future of life as a whole. If we coexist in a world where there is mutually assured nuclear destruction, or human induced climate crisis, or a mass extinction of the diversity of life, we become personally culpable for failing to act with our lives to protect the future of life.
7. **Maturity:** We have, by our dire actions as a species, ceased to be children of Eden or adolescents of religion and have to learn to stand in the universe and on planet Earth as mature beings, taking full responsibility for our fate, as a people and as a biospheric species. We cannot assume to pray to higher powers to guide or direct us. The buck stops right here. We need to be compassionate of all living species and all sentient beings and plant the seeds of love in everyone's hearts, but there is no need for renunciation of worldly desires, or overcoming the grasping ego, or clinging to life itself, all of which are means to natural survival, because, as mortal beings, the only true meaning we can achieve in life is to give back to the diversity of life with our lives, to protect and assist its immortal flowering in abundance.
8. **Mortality:** To exist in the physical universe, the sheer complexity of life has to oppose entropic decay into the heat death characteristic of physical systems, forming a negentropic self-organising system we call the biosphere. But genetic replication is endlessly subject to the very mutations through which evolution occurs, shaped by natural and sexual selection. Eucaryote sexuality evolved genetic recombination between mother and father to avoid lethal parthenogenetic decay, in which only half our genes go to our offspring, creating organismic variety in fertilisation that avoids extinction but results in individual organismic mortality. This cannot be solved by hungering for eternal individual life of an organismic "soul", which is selfish in itself.

9. **Sentient Consciousness:** The emergence of conscious life as we know it arose in the eucaryote endosymbiosis between the two founding cellular life forms, archaea and bacteria through a topological transformation that freed the cell membrane from energy production through sequestering in the mitochondria, leaving the cell membrane free for quantum sentience and social signalling.
10. **Biospheric Symbiosis:** The biosphere rises to climax complexity through planetary symbiosis, in which the seeming conflicts between plants and animals, predators and prey and parasites and hosts act to avoid each rising to boom and bust extinction and encourage species diversity. Humanity as a dominant species can survive long-term only by full symbiosis with the biosphere on which we depend for our very existence.
11. **Sacramental Evolution:** The biospheric sacraments have evolved to be able to tweak the sappy biochemical brain to bring it into a more universal dynamic, underlying our conscious existence in a state of psychic realisation to ensure humanity as a dominant species understands its ultimate connection with and dependence on the diversity of life in the biosphere and will thus seek to protect it with our lives. With expert compassionate guidance and deep meditation, these can bring about full liberation from the round of birth and death in this lifetime.
12. **Moksha and Enlightenment:** Rather than seeking an illusory transcendent or eternal state through spiritual elitism, submitting to materialistic desires, or fragile technological utopias bound to Fermi self-extinction, the entheogens bring us into a symbiotic relationship with life as a whole, so that biospheric life can perennially survive in the immortal passage of the generations. Through sacramental and other deep meditation, we can escape the mortal round of birth and death to experience ultimate reality, in moksha, thus achieving and realising cosmic consciousness. This is the source of all ecstasy, happiness and fulfilment and opens the true discovery of the deepest conscious realms and for cosmic consciousness to emerge from deep organismic consciousness.
13. **Compassion:** The key to all life and wisdom is to be ever compassionate of the mortal coil, which is permeated, both by the ecstatic joy of conscious resplendent life and physical suffering and decay, because through the mortal coil, all the immortal wonders of existence, both corporal and etherial arise.

Resplendence is NOT a doctrinal religion: Outside these principles, there is no doctrine of what to believe, how to redeem reality, or what we must each do, or not do, to achieve enlightenment in resplendence. There is no moral imperative, as we cannot be autonomous transformative agents if we are under the social control of an overweening belief system. Resplendence "to shine forth brightly" liberates from Religio "to bind together". Resplendence is thus to liberate from religious and materialistic bondage, in autonomous free will, to transform reality and protect life.

The "religious" element of Resplendence is not to debate cosmology or philosophy of mind but to motivate us all to seek the redemption of what humanity has done to life itself before it is too late. You could think of this and ponder that it is somehow both a manifestation of how Jesus expressed his wild free spirit in the Gospel of Thomas as a visionary innovator and how Richard Feynman felt conceiving of QED. And maybe you can begin to get a glimmering of why I have up till now sought your company, as an exceedingly rare species of visionary who genuinely holds the future of life on this planet in the palm of my hand, if only one or two people begin to listen, and who knows no one else who really can do this good thing for life in this way. I repeat, the world and its biodiversity needs and justifies your support of my endeavour.

Dec 2021 Chris to Elaine Pagels: So, although 150 species become extinct every day, I've been working on this, there is still time to save the diversity of life. We CAN DO this! What other option could there be?

Elaine: Yes, you help us hold on to hope that we so much need! warmest wishes, Elaine

Apr 2022: The Christian church was invented by Paul and the Hellenistic influence sources to him. If you take the Gospel of Thomas on its own, there is only vestigial reference to sacrifice and no reference to Jesus returning in the day of judgment. In fact he says the Kingdom is already here but men don't see it even when he is talking about the dead: "*When will the repose of the dead come about, and when will the new world come?*" — "*What you look forward to has already come, but you do not recognise it.*" So we have two scenarios: (1) Jesus was a brilliant innovator who tried to bring all the traditions together in a (confused) conflation of the Zoroastrian end of days, Hebrew religion and the sacrifice of the fertility God. (2) Paul reinvented the entire end of days using Jesus' mission as a cipher to weave a Hellenistic myth of the super-human saviour sacrificed by God to return as the Saoshyant [then cemented in the canonical gospels]. Of course I have to go ahead to the ends of the Earth to save humanity and the diversity of life. But now I have had to exorcise and expose the whole question of religious integrity. What was the meaning of pronouncing the epoch of the Tree of Life in Jerusalem in the Millennium on the basis the Christianity was in some sense a true tradition, only to realise its deep and diabolical sacrificial basis is contrived?

Elaine: Yes, you do need to go to the ends of the earth to save humanity (your name requires it of you, yes?)

Aug 2023 To James Tabor This is an open letter to you. I've cc'd it to Elaine Pagels as well, because we have had a few exchanges over the years and I value her opinion and experience a great deal, as she knows!

I have on my bookshelf your work "Restoring Abrahamic Faith", (Tabor 1991) which you kindly sent me a signed copy of in Feb 2010. You may have sent it, having seen the picture of Jane and myself in "Living Religions" and sent me the book from Genesis2000 in echo of our Genesis of Eden. I also sent you the June 2023 version of Symbiotic Existential Cosmology, which has become the pivot of the current unveiling.

You may remember that I wrote asking you about the origin of the Eucharistic flesh and blood. I have long thought of your statement that it was Paul in a vision (1 Corinthians 11), who had originally pronounced the notion of the Eucharist as the soma and sangre of Christ, not Jesus himself, as in the redacted versions in the Gospels, leading to the cannibalistic notion that without the shedding of blood, there is no remission of sin.

So I turned to your book out of the blue and realised that the import of its title "Restoring Abrahamic Faith" is encapsulated in the chapter on the messiahs, because this is where the contrasting personae of the messiah in the end of days, one a Christian destiny, locked as it is by Paul to Jesus as a Hellenistic Judaic supernatural avenging Lord, diverging fundamentally from the Jewish mashiach, looking instead to a human saviour of Zion, in long-term future goodness, and hence that the book is attempting to conceive of the messiah in the whole wider Hebrew "mother" tradition – in restoring Abrahamic, rather than merely Christian faith.

Your chapter ends with these two sentences:

"Both Christians and Jews will likely be surprised by the Messiah. In other words, he will probably not conform to anyone's expectations. ... One thing is certain when the Messiah comes, whoever he turns out to be, he will uphold these essential teachings of scripture. Can we do anything less?"

This may have been the basis of your originally sending me your book, because Jane's and my vigil to reflower the Tree of Life was highlighted in Mary Fisher's (2002) "Living Religions", portrayed as "Jewish Renewal":

"Contemporary Jewish renewal is not just an absence of fear. It is an active search for personal meaning in the ancient rituals and scriptures, and the creation of new rituals for our times. ... From highly conservative to highly liberal quarters, there are now attempts to renew the ancient messianic ideal of Judaism, that by its practice, the world might be healed."

Now this is both true and an unexpected twist of fate, because we did celebrate the millennium as the collective mashiach, with liberal Jews, and others, culminating in Eliyahu blowing the shofar, and pronouncing:

"We are here together the collective Mashiach and our vision here tonight will spread peace in our hearts and peace on the City of Peace below Yeru-shalom Jerusalem, and bisrata shem in Jah Allah, we'll be as a light and a source for peace in the whole world and in the whole universe".

Jane and I had earlier in the evening pronounced the unveiling anointing of all, in the names of God and Gaia (Ruether 1992), a version of Isaiah 61 in the shadows of Yeshua's Nazareth anointing:

*The spirit of God is upon us, the spirit of Gaia is within us
because they hath anointed us, to sing good tidings unto the meek ...*

weaving in a progression of Yeshua's twist concerning Naaman the Syrian and the Widow of Sidon ...

*to appoint unto them that mourn in Zion
in Palestine, in Sidon, in Syria, Arabia and the world*

completing with reflowering the Earth in the sacred reunion ...

*that they might be called trees of compassion
the planting of the divine, that all might be glorified in the abundance of wisdom
and we shall renew the old wastes and we shall restore the former desolations
and we shall repair the waste cities, the desolations of many generations
they hath clothed us with the garments of salvation
and I as a bridegroom decketh myself with ornaments, and I as a bride adorneth myself with jewels
for as the Earth bringeth forth her bud, and as the garden causeth the things that are sewn in it to spring forth
so shall harmony and fulfilment spring forth among all the nations
this day is this scripture fulfilled in your ears.*

This changes the emphasis, from preach to sing, from righteousness to compassion. It's we, not they, that renew the old wastes, and it's the female and the male together both anointing and anointed, for the harmony and fulfilment of all, in wisdom (*hochmah*).

While Jews will see in this passage the Jubilee, it is clear that Yeshua's sermon in Nazareth is portrayed as a direct messianic claim that breaches the Hebrew covenant, causing the crowd to seek him out to kill him, as it is with our rite of passage on Millennium Eve – an innocent pass, with tumultuous implications.

And all they in the synagogue, when they heard these things, were filled with wrath, And rose up, and thrust him out of the city, and led him unto the brow of the hill whereon their city was built, that they might cast him down headlong. But he passing through the midst of them went his way.

However I am not a practising Jew, but a circumcised gentile who claims to be the root Jewish "thief in the night" due to my preemptive circumcision. In fact I had no idea of the full dimensions of the Jewish messiah until shortly before I departed on our millennial sabbatical vigil to the Amazon and Jerusalem. Before I left, I intentionally took a single teaching at the liberal Jewish congregation here. When I arrived, the rabbi revealed this was to be on the messiah, and duly expounded that the concept of the Christ, Mashiach or 'anointed one' in the Jewish tradition is a living human being who brings about an epoch of long-term future goodness. As well as healing the Eucharist and reflowering the Tree of Life, I am thus taking Christianity back into the Hebrew fold of long term future goodness.

However, the true picture of this undertaking runs much deeper into the evolution of conscious life in the universe. I have not come to destroy the law, or the prophets, but to fulfil, in a surprising karmic way just as you described above. It is centrally to heal apocalypse. Not the all-too genocidal political apocalypse that the siege of Jerusalem proved to be in CE 66, in which 1.1 million people are said by Hugh Schonfield (1965) to have died, but a devastatingly deadly planetary apocalypse of life in the third millennium due to accidental or intentional mutually assured nuclear destruction, accumulating climate crisis, and the mass extinction of biodiversity, in turn, risking atrophy or extinction of the human species and with it, all our spiritual and cultural traditions.

Hence, when I say I am come to fulfil, it is fulfilling the immortality of the diversity of life throughout our generations and throughout the universe, not just our cultural or religious traditions. This in the light of my moksha epiphany in 2021, in which my atman merged briefly with Brahman, like Moses watching the burning bush, who intimated in silent compassion that I should return to the mortal coil because this is the centre of the cyclone where reality is really born, and it is my sacred duty to save life throughout the universe, because if life ceases to exist due to human misadventure, all meaning in the galaxy could be lost forever, because eternal ultimate reality, or the 'Elohim if you prefer, can be realised only through incarnate life experiencing it. Otherwise even eternal cosmic consciousness becomes as vulnerable as we are, as mortal incarnate organisms.

This, I believe you can understand, is the fulfilment of the epoch of long-term future goodness the Hebrew messianic tradition actually aspires to. So the rites of passage we performed in the spirit of Yeshua's sermon in Nazareth, when he escaped through the crowd seeking to throw him off the cliffs for blasphemy were threefold: to **unfold the promised epoch of the Tree of Life**, throw **open the Gates of Compassion** to all spiritual traditions and celebrate **the Hieros Gamos of woman and man in the Song of Songs**. Man cannot survive on religion alone, so I see this as the correct therapeutic remedy, so that conscious meaning survives in the universe at large.

When I set forth on the millennial journey to the Amazon and Jerusalem, it was to save the diversity of life on our planet so that our species can also survive and avoid a Fermi extinction due to human misadventure. I had had a vision in the 1980s, as an entheogenic practitioner that if the world did not make a decisive move to save the tree of living diversity by the year 2000, I should go to Jerusalem and pronounce the unveiling, in consummation of reflowering the Tree of Life, hidden since the "foundation of the world" in Eden.

This was giving the world a good 15 year chance for either our collective social conscience, or some genius "messiah", to step up and deliver the redemption. As no solution in sight emerged, I duly planned and managed to secure an academic sabbatical to research the holocaust of living diversity in the Amazon burning season, culminating in an invitation to hold a 12-day workshop hosted by Yitzhak Hayutman, a grand-son of one of the founders of Tel Aviv at the Academy of Jerusalem.

In turn, Jane and I duly fulfilled this quest, from the Andes to the Amazon and through Europe to Jerusalem, ending paying my respects to Kali in Varanasi, as described in Symbiotic Existential Cosmology.

But now, the same dilemma remains. Just as I waited 15 years for the world to resolve its misadventure, without my idiosyncratic help, so I wait now 23 years closer to the edge with no remedy in sight and no other hero or heroine to invoke the unveiling. The lesson in 2000 was the inability of the three monotheistic religions to come to protect the epoch of the Tree of Life and I had to look pragmatically at this failure of stewardship and make a subtle intervention to record key rites of passage of renewal as renewal of the spiritual epoch. The same thing now applies to the entheogenic moksha epiphany, which has become overt because of the evolution in psychedelic research, in which psychedelics have been scientifically found to be redemptive of the mortal coil, so the stable doors of repression have been thrown off their hinges and the genie horse of the visionary condition has escaped into scientific recognition.

This vision draws together multiple spiritual traditions, fulfilling the sacramental tradition in biospheric illumination, the messianic tradition in unfolding the epoch of long-term immortal paradise, and the Upanishadic tradition in entheogenic moksha in a classic near-death meeting of Brahman and atman and primordially, in the oldest tradition of animistic shamanism that lies at the foundation of the mystical numinous and all religious traditions. I can't seriously neglect this responsibility, because I don't see anyone on the horizon who can relieve me of this and time is of the essence and I am already past my three score years and ten.

The whole of my incarnation is a karmic test. On Christmas Day 1944 the first radiated plutonium slugs began to roll out of Hanford, signalling the real beginning of the apocalyptic age of Planet Earth. Twelfth night, I was born Chris King on the Epiphany 1945, just as the first shipments of plutonium rolled out of Hanford for Trinity and Nagasaki, later that year, so I am the offspring of nuclear holocaust, graphically expressed by Michael Ortiz Hill (1994), in "Dreaming the End of the World: Apocalypse as a rite of Passage", in describing the first words following the Trinity test. To me karma is not a moral question, but a reality of the living quantum universe. By contrast, I ascribe to Richard Alexander's view of morality as a product of sociobiology in intelligent strategically-bluffing societies to achieve inter-social dominance by intra-social cooperation enforced by altruistic punishment. But karma is something I have to live with and accept, as a prime motivation to heal when there is no other avenue in sight.

Symbiotic Existential Cosmology is designed as a scientific cosmology which includes primal subjectivity as the existential part. It extols symbiosis as the full natural expression of what religions call spirituality in physical, biological, and conscious terms. It is also a living Logos of my personal vision quest to discover the foundations of reality, but it is not a nascent religion, but a consensual democratic way for all of us to reflower nature and discover ultimate reality together, no longer knowing only in part, but knowing also as we are known, as one is to one, face to face, no longer through a glass darkly.

Its key tenets are:

- (1) That subjective consciousness is primary, as in the Upanishads, but the universe is necessary to our conscious biological survival and immortal fulfilment.
- (2) That subjective consciousness has efficacy of volition over the physical universe, opening up the foundations of innovative spirituality to physical nature and our ability to take full responsibility for our actions, as criminal and corporate law on intent asserts.
- (3) That the universe rises to climax conscious diversity in planetary symbiosis on the cosmic equator in space-time.

And it takes a huge leaf out of Yeshua's book, as the controversial and even blasphemous figure, trying to provoke apocalypse by spanning all the near Eastern traditions, from Dionysian miracles, through the fertility religion of the women of Galilee who gave unto him our of their very substance, anointed by a woman to his doom, as was Dumuzi, and finally both the Hebrew and Gnostic traditions, as the Sermon of the Mount and the Gospel of Didymos Judas Thomas, demonstrate.

So if you think about it, since you already prefigured this, would you expect anything less than the impossible quest of a mathematical chaos theorist and wilderness mystic, carrying the entheogenic sacraments of the biosphere out of left field to fulfil the true eucharist of life, amid renewing the old wastes in the planting of the divine, so that all might be glorified in the abundance of wisdom, when the world is faced by ongoing potential nuclear annihilation, climate crisis entering tipping point whiplash, the frank mass extinction of biodiversity, particularly of the land mammals and the self-mechanisation of AI takeover of our very essential being? But this means it extends beyond cultural theism, to

ourselves becoming the visionary guardians of life unfolding, with subjective conscious efficacy over the physical world, invoking the full root mystical and spiritual natures of reality in climax living cosmology. This shouldn't be a shock because the Upanishads already conceive of reality either as personae in the 'Elohim Ishvara/Ishvari, or as meeting ultimate reality in the atman in cosmological symbiosis with Brahman.

I am doing this good thing regardless, but I realistically can't and shouldn't do it alone. I want to do it as Lao Tsu would. A mashiach doesn't have to be a religious leader, just provide the therapeutic avenue to world redemption. That's why Symbiotic Existential Cosmology is a resilient scientific Logos that marks out the Tao as a vision quest, but not any kind of religion, or we will never come of cosmic age and take astute responsibility for our fates. It's the full apocalypse, as a psychopomp marking safe passage in our mortal journey across the Styx, in the fulfilment of life as a whole, perennially throughout our generations amen. It's not a lesser Revelation. It is the gift of life itself. I don't ask anyone to believe in me, but simply to understand that the remedy is true redemption.

But let's look for a minute at the naked realities. Paul converted Jesus into a supernatural Dionysian figure of Hellenistic Judaism, and Revelation exploded his persona into a vengeful Lord of triage and genocide of life that no conceivable flesh and blood messiah can achieve, as a means to enforce the rule of Christ on Earth for ever and a day, when, as Elaine and others have noted, Jesus claimed return in power in the same generation as those who stood before him, never materialised. Equally unlikely is that notion of the Jewish state appointing a sacred king as messiah, so we have to consider the wider and deeper view we are facing of planetary cultural instability and an apocalyptic Fermi extinction caused by humanity itself.

We need to be practical and ask what the world really needs here, and it is clear as a bell that we are flying blind like a moth into the candle flame of a Fermi planetary extinction because humanity is unable, without help, to avoid irreversibly damaging the biosphere and precipitating our own extinction. This urgently needs compassionate healing to get us safely across the Styx so that the epoch of the Tree of Life can reflower and unfold in conscious immanence and transcendence in symbiosis with natural climax.

We need to take serious note of Yeshua's own view of his intrepid voyage, bearing in mind that as history tells it, he brought annihilation upon himself and that, although his apocalyptic visions appeared to be more than fulfilled in CE 66, he failed to return to complete the assignment.

"I took my place in the midst of the world, and I appeared to them in flesh. I found all of them intoxicated; found none of them thirsty. And my soul became afflicted for the sons of men, because they are blind in their hearts and do not have sight; for empty they came into the world, and empty too they seek to leave the world. But for the moment they are intoxicated. When they shake off their wine, then they will repent."

This is going to have to take some very level-headed assessment from astute human beings. If we are going to sacrifice the messianic tradition of healing apocalypse in long-term future goodness, do we have the ability to save the planet from ourselves without it? Would it be better to dispense with monotheism entirely, and would we then be able to put nuclear, climate and biodiversity self-destruction behind us on humanistic grounds of survival alone? Or do we need the visionary insight of apocalypse because otherwise, business-as-usual and populist politics and strong-man tactics will cause an inevitable tragedy of the commons? Or has karma in its own weird singular way, like the very evolution of the entheogens, given us this short, dangerous visionary way through to paradise on the cosmic equator, by realising ourselves and adopting natural messianism as a healing conscience to reflower life again on Earth and survive for another one to a hundred million years in natural abundance, rather than the triple witching hours of stock futures, nuclear hair triggers, climatic tipping points and habitat desecration?

So James, what sayest thou? Did I mention anywhere that this would be easy?

James: Thanks for this Chris ... I am totally under water with some hard publishing deadlines and a round of conferences and papers into the Fall, so can't give this much time right now now ... this is long and complex ...

Chris: Many thanks for the quick reply and for your astute consideration! We are living in a very fragile world. Time is critically of the essence and life is at stake. We all need to take responsibility for the situation in which we actually find ourselves. This prospect is not easy to evade with integrity for any of us. It's a root challenge to the zeitgeist, but please take it seriously.

Deepak Chopra: All perception is convenient magical lies - illusion. EEG, fMRI are sophisticated illusions, as is our body mind and universe.

Grant Gillett: But very handy to stop one getting hit by cars or other large objects.

Deepak: Car, body, pain, birth, death all entangled illusions. Agree that we should be careful in body and care illusions to avoid illusion of death. Awareness as formless being is beyond illusions of both and death. I would however love to upgrade the illusion of separate mind causing war, injustice, climate change and possible extinction of the dreamscape. ... I maintain what I said all perception is "convenient" magical lies. Perception hides the truth to maintain the survival of species. Biology is an experience in non local awareness. In pure consciousness, biology is spontaneously self regulating as homeostasis.

Chris: Biology is NOT just an experience in non-local awareness, it's our very incarnate embodiment as living organisms. The universe is not either. Biology is not just a homeostat like a simple thermostat seeking fixed conditions. This is trivialising evolutionary biology and it's creative, innovative capacity.

We agree on pure physicalism being inadequate but:

- (1) A complete somersault volte face from pure physicalism to pure mentalism is not a paradigm shift and it's not original or a new discovery. It's not even a revolution, but a cop out to ancient doctrine without any new insight. Neither Vedanta nor Creationist ideas solve this in a way which protects the status of life upon which our existence depends. Symbiotic Existential Cosmology is NOT physicalist and IS the middle way. That IS a paradigm shift that you can't even begin to disentangle.
- (2) The two solutions are toxic to the sanctity of life because they don't even count life in your vision of perception as simply an illusion to keep the species alive.
 - (a) Appealing to full blown primordial cosmic consciousness is nowhere near a solution and its NOT a paradigm shift at all because it dates from 3000 years ago. It has no details and no content except for a limited belief in samadhi as a route to ultimate reality endlessly postponed by cycles of reincarnation.
 - (b) Appealing to creationism in the false identities of intelligent design or "holism" simply doesn't provide an explanation. It leads to a sterile designed state of the universe with no consciousness, creativity or visionary capacity – just a designed object. Because design is manufactural. It's not even physical just a slave of the notion of technology and manufacture.

Put simply, mind-only, or consciousness-only, or God-created pseudo-cosmologies are just as toxic to life as hard core physicalism.

Deepak Chopra: Chris Sorry Not explaining anymore Try Samadhi if you haven't. Animals have awareness as do bacteria and plants - anything that is sentient by definition. However they all differentiate from pure consciousness. The difference between us and other sentient beings is our desire for self knowledge and wisdom. That's the prevailing opinion. I'm not a scholar but a serious student of yoga not just theory but daily practices for last 40 years up to 4 hours daily. At 77 years have not missed a single day.

Chris: I want to make clear how this Vedic dialogue about consciousness is incorrect cosmology and destructive to the cosmological role of life in the conscious universe.

Symbiotic Existential Cosmology has three components: (1) **Cosmology** because it is a scientific description of the natural universe, (2) **Existential** because it fully incorporates interactive subjective consciousness into the cosmic description and (3) **Symbiotic** because it correctly describes the central role of life, the biota and the biosphere in supporting subjective consciousness in the physical universe as a climax crowning cosmological manifestation of existence, over cosmological time scales. It does this based on a huge amount of empirical data spanning the sciences and fully opens the subjective vision quest that is at the mystical foundation of both Vedanta and Monotheism. It is not something you can reduce to a notion in samadhi, as a hearsay account, however long you have been doing yoga or believing in creation.

Life has emerged late in the evolution of the universe and requires multiple kinds of supernovae and neutron star collisions and novae to make the chemical elements and the elements of life. Everything we see in this shows for example that the generation of organic molecules up to amino acids is a cosmological phenomenon, as well as well as accompanying minerals like olivine that appear to be pivotal in the lost city vents providing the metabolic substrate for biogenesis. The evolution of life has proceeded on Earth for about a third of the universe's lifetime of around 13 bya

from 3.6 bya ago within a few hundred million years of Earth's formation and the condensation of liquid oceans and has taken a full third of the universe's lifetime to get to humanity and the present planetary crisis that risks human and biospheric extinction on evolutionary time scales due to a Fermi self-extinction from cultural instability.

Vedanta tries to claim a cosmological basis for fully fledged cosmic consciousness as ultimate reality that created the physical universe out of itself. Monotheism claims that the universe is a creation of an omniscient, omnipotent god that issued a logos command: "Let there be light" and "there was light". We know these accounts lack even the most basic elements of empirical biological validity. The Sabbatical creation in six days has the creation all out of order, with the plants arising before the solar system and the aquatic and land animals equally out of natural sequence. Vedanta and Buddhism see all living organisms as simply sentient conscious beings, and in the face of the inability of samadhi to reliably produce full visionary moksha, retreat into the notion of reincarnation, in which there is no recognition of living species and in which a selfish egotistical person can be reincarnated as a mosquito, or even as a malaria plasmodium, in a false moral cosmology.

In Vedanta, this has arisen from Upanishadic meditation producing states of subjective samadhi that the rishis, in realising that from birth they had known only subjective consciousness, was then claimed to be the very basis of the physical world around us. The first premise was correct as we all know this is the case – that 100% of our experience is subjective and that we infer the physical universe collectively through our experiences of it. The rishis should also have recognised that they are biological organisms, who die if they are cut or hit and taken much more interest in the diversity of life around them. But then the rishis extended the obvious realities of subjective existence into an eternal account of cosmic consciousness ruling and creating the universe, in much the same way as their Aryan roots in Monotheism. Both these cosmologies have no evidential basis and are simply patriarchal illusions that deny the ultimate sanctity of life itself and our long-term survival as a living species.

Both Vedanta and Monotheism are false cosmologies, because, unlike the living universe, which has risen to biological biospheric climax in life and consciousness, they both run down hill into a destructive chaos no better than physical entropy. Vedanta and Buddhism both end up in epochs of decline and destruction typified by the Kali Yuga and Samvartakalpa. Monotheism ends up in an Armageddon in which the entire living Earth is destroyed to hold all humans to account in a day of Judgment resulting in starkly divided heaven and hell realms. What is clear in both these accounts is that the central phenomenon and manifestation of conscious existence, we know as biological life is held captive hostage to degenerate cosmological notions of a consciousness which starts out fully powerful and aware and then descends, because of a false morality of divine order and obedience, to cosmic war and destruction of all life within it.

These grim realities are no better than Bertrand Russel's stark vision of physicalist demise: "*Such in outline, but even more purposeless, more devoid of meaning is the world which science presents for our belief. Amid such a world, if anywhere, our ideals henceforward must find a home. That man is the product of causes that had no prevision of the end they were achieving; that his origin, his growth, his hopes and fears, his loves and his beliefs, are but the outcome of accidental collocations of atoms*".

We as living subjectively conscious biological organisms need urgently to come to terms with what our role and meaning is in the conscious living universe. Neither physicalism nor Vedanta nor Monotheism are fit for purpose.

Vedanta poses a unique threat to the sanctity of life, for the very reason that it claims the entire physical universe was generated through a fully complete, ultimately powerful cosmic consciousness that generated the entire universe without any recourse at all to the biological existence we find ourselves in and having to come to terms with. This is a cosmological short circuit because it makes an a priori claim to an absolute consciousness that can create the entire physical universe, from individual quanta to black holes, without needing any form of life at all. There is no meaning or remote sense to any of this and it does NOT provide an explanation of anything. Why would such a complete existential cosmic consciousness make a universe that is endlessly running down into Kali Yuga full of individual egos that are struggling through endless reincarnating lifetimes to get back to the state cosmic consciousness was already in in the first place? The tantric creation has a different story in which male consciousness and female embodiment became ever more separated, but the notion of a pure conscious creation is denial of this sexual complementation, which arose later in history.

Vedanta is effectively cutting biological life completely out of the loop in a cosmic picture leaving only an objective universe propelled by a degenerated form of cosmic consciousness that Deepak decries as ego-consciousness, with the mind-brain as a mere object, which is in an endless failing struggle to get back to square one.

We simply can't afford to separate life from consciousness in this way. It's the worst form of cosmological schizophrenia.

Symbiotic Existential Cosmology is the middle way because it accepts all of empirical science as an account of the natural universe, and complements it with full subjectivity fully interactive with the physical universe and creatively unfolding it both in the evolution of life and in our subjective vision quest restoring our root creative meaning in existence of life, the universe and everything. And it realises in the symbiotic biosphere how subjective and objective aspects of cosmic reality rise to climax at the creative edge of chaos rather than simply competitive survival of the fittest, so it invokes the Tree of Life in the full unfolding of cosmic consciousness in real time.

Why can't you see and understand this all came from a moksha experience of meeting ultimate reality and being tasked with saving life throughout the universe so that cosmic consciousness itself can continue to survive. It's that simple. It's the remedy. It's the therapy. It's our living quest fulfilled. It's the corner stone the builders of Vedanta and Monotheism ignored, leaving a universe in ruins!!!!

Deepak claims authority by saying he is 77, so should I claim higher authority because I am 78?

All I can do is give you life unfolding. It's up to you all to protect it.

I am not going to be here forever, so please heed my words while life still lies vulnerable before us!!!!

Kashyap: I do not have any favorite model for consciousness, either scientific or nonscientific. I am hoping that neuroscience will understand it, but most likely it will not be in my lifetime!!! Anyway, cosmology I know uses just straight principles of physics. This has nothing to say about consciousness. Vedas and Upanishads are fine with me for their spiritual message. I doubt if we can learn much science from them!

Deepak: All the best. I have nothing to say. I'm not a scholar. I only speak from my experience. As a person I have no fixed identity. All identities seem provisional to me other than pure consciousness differentiating into all identities. I AM That

Chris: Deepak, nice to see you reply, but you simply haven't given any clear idea of the role of the diversity of life in your cosmic picture. I want to be your comrade in love, but you are taking a needlessly casual deconstructive position.

You quoted this: "I maintain what I said all perception is "convenient" magical lies. Perception hides the truth to maintain the survival of species".

This looks like it is coming straight from an interview with Don Hoffman on "Against Reality". Don is correct that our perception is an evolved internal model of reality, just as a cat's olive-shaped pupils are an adaption to night time hunting, but our perception is enhanced reality in full colour, 3D and size preserved transformations that preserve corporeal integrity. It is NOT an illusion but super realism – i.e. surrealism. The universe outside has no colour and is just collections of fundamental particles.

But you are turning it into a pre-emptive attack on nature as illusion, as if we shouldn't be taking care to survive at all. This raises lots of very thorny issues for your perspective. If you are saying perception is a lie to maintain the species, it implies your view of cosmic consciousness doesn't give a damn about whether species live or die because it's all cosmic consciousness anyway. You are a biological organism and a doctor, so this is a travesty of the Hippocratic oath to preserve human life.

You also treat all organisms without distinction, as simply sentient beings, without species, genetic or ecological meaning: "Animals have awareness as do bacteria and plants - anything that is sentient by definition". But nature rises to teeming symbiotic climax in the biosphere, not just colourless indistinguishable sentient beings. You then

immediately cite human superiority over nature: "The difference between us and other sentient beings is our desire for self knowledge and wisdom." Well that's news, so let's look at how you handle nuclear crisis.

Fig 292b: 5-11-23 The Israeli prime minister, Benjamin Netanyahu, has disciplined a junior member of his cabinet who appeared to voice openness to the idea of Israel carrying out a nuclear strike on Gaza. Netanyahu's office said in a statement that the minister concerned – heritage minister Amihai Eliyahu from a far-right party in the coalition government – had been suspended from cabinet meetings "until further notice". Asked in a radio interview about a hypothetical nuclear option, Eliyahu replied: "That's one way." His remark made headlines in Arab media and scandalised mainstream Israeli broadcasters.

Chris: When I originally formed the Resplendence group, *resplendere* to "shine forth" rather than *religio* "to bind together", it was to act directly save the planet from biodiversity extinction and nuclear holocaust, but then Ukraine happened and the pre-emptive nuclear threat from Russia, so it went on the back burner and I spent two years writing Symbiotic Existential Cosmology which is now, with the central thesis, as complete as it is going to be. Look at this little dousie! Do you all want our species to survive or not?

Deepak: Maybe homo sapiens is the most interesting evolutionary experiment that didn't work. There are 2 trillion galaxies, 700 sextillion stars and uncountable trillions of planets in the collective dreamscape! We are not even a speck of dust in the junkyard of infinity. We evolved as a result of the extinction of Dinosaurs. Nature may have another experiment in mind. Relax.

Chris: This is profoundly irresponsible. To allow nuclear holocaust, or to destroy the diversity of the biosphere, or even to mention it casually is disinformation that leads to human irresponsibility, NOT wisdom. That's the reason to act Deepak! Don't cast lots on the garments of the universe in vain hope when we have the holy grail of life before us. The original Yeshua said "*The Kingdom lies before you, but men do not see it.*"

The only way I can act to plant the seed is as the messiah of living diversity and try to bring a modicum of compassionate common sense to the people of this planet. I can do this good thing, but only with your good support. The messianic tradition is not religious superstition, it's karma speaking through individuals. I do have the karmic connection. On Christmas day 1944 plutonium production for Trinity and Nagasaki began at Hanford. I was born Chris King on the Epiphany 1945. I have a duty to fulfil.

The key to saving humanity is to have your finger on the pulse like a good doctor, rather than on the trigger. I have the remedy, which is to save the life of this blue green planet now for our future generations to survive. The mushroom is a catalyst that does not involve religious belief, but is a product of the evolving biosphere to make it all possible.

I know it's a paradox, but through this we ALL become saviours!

Deepak: Chris How do you treat collective insanity and diabolical science based on subject object split?

Chris: You know the answer Deepak! Collective insanity is samsara! It's unstable delusion! But underneath, everyone wants to survive and become whole, and we yearn for relief! So collective insanity is like the false inflationary vacuum that collapsed, causing the Big Bang that made this whole shebang!. Resplendence is the light of sanity that shines forth, through us coming to our senses in light relief. You are doing a very good job right now by playing the joker.

Dan Levine: Chris, I am with you all the way. As for my karma: my honeymoon consisted of a 10-day car trip from Los Angeles (where my wife lived before marriage) to Pittsburgh (where I had a job at the time), via the Grand Canyon, Petrified Forest, and Santa Fe. Toward the end we stayed with in-laws in Oak Ridge, Tennessee, and they took us to see a community theatre performing *Man of La Mancha*, the musical based on *Don Quixote*. The song in that musical summed up why I have devoted my academic life and writing to the pursuit of understanding, and eventually dealing with, the science of the roots of meaning, empathy, and their absence.

Joshua Davis (2009): Chris and others are calling people to participate in this collective messianic adventure. It seems to me that the readers and recipients of such a call ought to consider this call very carefully.

Deepak: Academics with Ph.D. Nobel Laureates etc have contributed a lot to human comfort and made modern living possible. They have also contributed to diabolical technologies including nuclear weapons and modern warfare and climate change and chronic diseases. Human extinction and extinction of life on this planet will be the gift of diabolical science.

Kashyap Vasavada: What you mention is the usual question “how to prevent misuse of science”. Neither Oppenheimer nor any scientist including poor me, have an answer for this question. Laws of science are same whether you use them for construction or destruction. There is one other point. This is not a recent problem. Since the day the human race arose, there have been endless fights for possession of territory. The tribe which had better weapons usually won. In Mahabharat war some 100,000 people were killed with bows and arrows. That was a very large fraction of population of North India in those days. In fact Krishna told Arjun repeatedly that it was his duty to fight to save Dharma. Of course the big difference between that time and today is the massive destructive power of nuclear weapons. But is it our duty to help Ukraine and Israel which could result in nuclear war? Do you have answer for that? I do not have!

Chris: The problem is due to males controlling the tokens of institutional culture and ignoring existential risks of annihilation because this is how males have always survived and reproduced. Mutually assured destruction is the logical end game of paternity uncertainty in which men risk death to reproduce and control women with lethal force to achieve it. It has been reinforced by religion so both Ukraine and even more Israel has a religious dimension of Zealous zionism facing utopian claims that Islam is here to dominate the Earth in the name of God. This is the ultimate alpha male delusion.

You men simply don't understand that women are fundamentally different because they give birth and have to invest their lives in the future generations. The females are truly the immortal sex because the cytoplasm is purely maternal and that is the mother liquor of life. They make much better long term investments than men, although we know about Indira Ghandi and Margaret Thatcher. Paternity uncertainty results in a male strategy of mortal vulnerability and lethal risks to dominate and reproduce because they can't do it on their own. Consequently, men have controlled women since 10,000 years ago e.g. under pain of stoning, FGM and suttee to control their reproductive choices. Women CEOs, even in so-called liberated societies, last only 2/3's as long as male CEOs because they are given poisoned chalice roles by chairmen of the board, so the glass ceiling has become the glass cliff (Tapper 2023).

Nancy du Tertre: Dead-on correct. I have often thought about ways to address this biological imperative that results in male aggression/wars. I believe soon the answer may come in the form of taking away the female exclusivity to give birth by tinkering with non-gender based and artificial Petrie dish births. This will result in less tension to fight for the female to perpetuate oneself/the species. And yes, with a few exceptions as you note, women do not think like men and find killing repulsive as a concept since their biological job is to protect and nurture life, not destroy it!

And, while we're on the topic, most of the aggression and competitiveness that goes on in these male-dominated Google groups, such as this, is an intellectual equivalent of war - kill the intellectual competition!! Aggression. You don't find that with groups of female colleagues.

Mike Pitman: Possibly you have no answer because the only answer, Kashyap, is morality and as you say, objective science doesn't 'do morals' or values of such kind. The issue is not scientific but ethical.

Chris: Patriarchal morality is the very source of the problem Mike! Legislating against abortion in the US on religious grounds is a key manifestation of religious patriarchy, not misuse of science. Ethics just brushes it under the carpet.

Mike: Nonsense, Chris. Killing is the problem. Where did the adult-to-be that's been killed in womb derive from?

Chris: Precisely Mike! You have type-cast yourself as a patriarch, just as I expected! Notice I said “on religious grounds” knowing you would fall in like a stone!

Women don't willingly terminate their own offspring. My partner was forced into an abortion because she didn't know if it was her then husband's or one of our her best friends. When she lamented the fact that her husband then ran off with several women, leaving her without child I offered to let her have a baby with myself and my wife, whether it was

mine or not. She is a wonderful loving adult daughter, that lives because her mother was forced into an abortion by a man unwilling to own possible responsibility because he was married!

Do you want me to expand on child death rates due to step fathers? And Nancy is right about male combat to the death in these groups.

Mike: OK since I'm male I can't help a patriarchal title thrust on me (by your agenda alone in my life) any more than a woman can a matriarchal. I'm not getting into the difficult, fraught, nuanced, emotional and personal areas of which you speak. That's for philosophers, politicians, psychologists and priests. I merely note that morality is a real issue. And that killing is killing. These are facts. So is the law of *karma* which (wo)men so at cost ignore. Whence does morality originate? You have failed, as usual to answer a germane question, in this case '**where did the adult-to-be that's been killed in womb derive from?**'

Cathy Reason: The same molecules which you imbibed in your Sunday lunch. I'll leave you to decide if that makes you a cannibal. By the way, I think so-called "anti-abortionism" should be called what it really is, which is coercive reproduction. It is morally indefensible under any circumstances, and no-one who advocates for it should be given the time of day.

Chris: I told you the answer to the germane question but you didn't comprehend it – the paternity in the case I quoted was uncertain and that caused my partner (before I met her) to have to fly to Australia to have an abortion at the behest of her lover who was also married. This is a common problem with fluid relationships. Women are meant to be the providers for the next generation but are treated like trophies by sexist men who often run for cover faced with parental responsibilities. It's called sewing wild oats! Actually the lover ended up never having their own children because his wife had had a back street abortion before he met her for fear of her parents and became infertile so he lost out as well. She died of alcoholism and their adopted daughter has ended up a meth addict. That's karma for you Mike but it's not moral! As I said, I gained a loving daughter out of this who would have never existed apart from my anti-patriarchal free-love ethics, so karma was on my side and cemented the extended family.

Even in the post-pill world, women have to have sex for social reasons, whether they like it or not and then become the victims of male-induced pregnancy. They are forced to be the risk takers, particularly in under-privileged communities, when it is the men driving the entire reproductive risk-taking and the planet to risk-taking nuclear and climatic demise.

Morality as we know it originated from the patriarchal control of religious and cultural institutions and the control of female reproductive choice. Morality is simply a prisoners' dilemma game inhibiting intra-social competition, under pain of punishment, to ensure inter-social dominance. Lethal in the case of stoning and lethal to conjugal joy in the case of FGM and prospectively lethal in the case of Suttee and bride burning.

Karma is the quantum universe in action, not moral law. Below is an example of patriarchal moral imperatives across Muslim cultures which is appalling but necessary to face. As shown in fig 134, Iran is literally shooting the eyes out of female protesters chanting "woman, life, freedom" and stockpiling nuclear resources as we speak. Is THIS morality at work, or just institutional male reproductive jealousy?

Kashyap: What I am saying is that the issue of war and weapons people use is a complex, tens of thousands or even millions of years old. Just calling it unethical will not solve the problem. ... Who is unethical, you the voter, politicians, military or the scientists?

Chris: You are looking through a physical view that sees it simply as an arms race, without any depth of understanding of human nature. Issues of ethics about democracy and cultural decisions exemplify the problem culture has defined, but human nature is absent in your description.

Mike: I meant where did humans come from? Like Kashyap, you stonewall on these issues because you 'know best'. So it must be all by chance. Many thousands (and rapidly increasing in number) of very well qualified biologists would dispute, by their interpretation of the facts, your view. And, if they are right?

Chris: Because you believe in creationism, you are looking through fundamentalistic glasses in denial of human origins and cultural versus biological evolution because you can't accept empirical biological science and pretend that "thousands of well-qualified biologists deny evolution, so you are in massive denial of empirical biology.

Joshua: These are precisely the kind of questions that can be addressed via the field of research of **The Science of Peace**. For example, if we can learn to achieve inner peace by practicing meditation, prayer and actions of kindness, would it be unethical to neglect such a learning process? So, voters, politicians, military people, artists, scientists and people in general, who neglect spiritual development and practices towards peace, are acting irresponsibly and unethically.

Chris: I can understand the desire to seek peace but it flies in the face of nature and it involves trying to graft pure spirituality onto a statue made of biological tissue with the head having no notion of long term survival of the body. A kind of metaphor for Biblical Daniel's statue with feet of clay. And what is peace going to do to deal with armed defectors? The peaceful naked Albigenses ended up throwing themselves into the bonfire at Carcassone!

You three men are all missing the picture because you are looking through different sets of falsely-tinted (biased) spectacles. Only Nancy and Cathy have a good grip on this problem. I have given an outline critique below of the ways each of you Kashyap, Mike and Yeshua are in error and in danger of resulting in stasis, or making matters worse rather than better. I'm doing this for SEC, not just for you all and its followed by the evidence of the human "Mark of Cain" on all of our genomes. You need to "get real" and read this very carefully if any discussion is going to further.

The empirical facts of human biological and cultural evolution, put in very simple terms are that (a) we evolved and emerged among the apes with a sexual investment strategy that shows intermediate similarities to both chimps (who live in alpha male troops maintaining hierarchical dominance) and bonobos (where the females retain ascendance and have a lot of vaginal-vaginal sex – 7 times as much as heterosexual sex – to maintain the female coalition) and falls part way in between these two, driven by female reproductive choice based on astute observation of male prowess and ability to responsibly father their children following a mammalian X-Y selection for intelligence.

The emergence of human culture and super-intelligence (Fielder & King 2004) occurred in a sexual Red Queen evolutionary race (Ridley 1993), in which neither the males nor the females had the upper hand in reproductive investment, in a pattern of astute female reproductive choice accompanied by mutual mate choice. The males put on shows of hunting genius, trading meat for sex and telling jokes round the camp fire, while the females chatted endlessly about their relationships while gathering 85% of the food, foraging together. Females have ecstatic orgasm and have concealed oestrus, so the males can't tell when they are fertile and instead menstruate visibly when they are NOT fertile. They have fatty enticing breasts and a neotenous babe-like physique, inviting non-stop social sex to promote human family bonding. The penis has grown large for female pleasure and lost the penis bone and sensitive spines, making human males more vulnerable to female arousal. There is plenty of evidence for a virtual sex-strike by the women who would twerk under the full moon, as the Sandawe are still reputed to do, and to refuse sex unless the men brought back fresh meat, as the San hottentots were forced to steal cattle over in the 19th century.

This went on until the neolithic around ten thousand years ago, when the males staged patriarchal cultural take-over. This is not about Darwin, but Dawkins and memes driving human culture, through sexual, moral and religious chauvinism. Male dominated clans committed genocide on neighbouring competing clans wiping out the males and abducting the women. The reproductive sex ratio fell from a historical 2 females to each reproducing male (because all fertile females can easily get pregnant, but only about half of men are successful) and rose astronomically to 17:1. This caused a precipitous trench in human Y-chromosome diversity, fig 133, which is the mark of Cain on the human genome. It led to patriarchal take over by the shepherd kings of the ancient planter Goddess in Sumeria and the Genghis Khan syndrome of extreme male hypergamy. 1 in 200 men still have a Genghis Y. This led in turn to patriarchal religious cultures, with the Hebrew "go forth and multiply" leading to the population crisis with Christian and Muslim and Hindu patriarchal control to outcompete one another by having more children, leading to war and the rumours of war between clashing civilisations as populations multiplied and competed for resources.

This shows that we can only solve climate crisis, biodiversity crisis and nuclear annihilation by correcting the patriarchal dominance of human sexual, cultural, religious and institutional culture. You can't do it by reinventing ethics of peace based on a morality that is already corrupted at its very source, or you will just repeat the mistakes of the last ten thousand years.

Mike: You have good points but are hung up on your own illusions. And you never answer any question! Break your habit just this once and tell us just how sex was able to evolve.

Chris: Sex is universal to both cellular and viral life. Transfer of whole genetic sequences is the most powerful form of sequentially-coordinated functional evolutionary mutation. It is highly non-random and far from equilibrium thermodynamically. Sex is sharing genetic information, rather than having to evolve it de novo, although it results in a contamination risk. Horizontal transfer preceded vertical inheritance in the founding progenote of loosely coupled genomes. Both bacteria and archaea have promiscuous interspecies sex, via viruses, phages, conjugation plasmids and other transposable elements. Horizontal transfer has continued in higher organisms too.

The origin of eucaryote meiotic sexuality is caught up in the eucaryotic origin, along with mitosis, both of whose origins remain speculative because all the evidence has been washed away by the sheer dominance of the eucaryotes themselves over all their predecessors. One interesting proposal is that the entire apparatus came from a large DNA virus with linear genomes that was also responsible for the transition from reverse transcriptase based RNA-DNA genomes to DNA-polymerase based genetics.

Meiotic sex in each parent contributing only half their genome to the child is the most altruistic end result of genetic evolution conceivable. But metazoan dyadic sperm-ovum sexuality is nevertheless a counterpoint interplay of sexually antagonistic co-evolution, as a prisoners' dilemma game, from which neither sex can escape, and so each tries in often diabolical ways on the male side, because his contribution is only the DNA of the sperm selfishly propagating its entire genome for the survival of its genes. So males seek to out-manoeuvre the other sex. Homo sapiens is no exception. Insects have notoriously exploitative male strategies, such as poisoning or injuring the females so they can't mate.

Because mammals have XY male and XX female sex chromosomal inheritance and give birth to live young, unlike birds with ZW females and ZZ males, where both sexes parent eggs, male mammals tend to specialise in sewing wild oats indiscriminately and risk-taking conflict in male-male reproductive battles, sometimes to the death, while females focus primarily on parenting the next generation and astute female reproductive choice. Hence only 3% of mammal species are socially monogamous and even those (including humans) are not genetically monogamous and have clandestine flings. In humans with massive single pregnancies and long child-rearing, this strategic asymmetry is at a relative extreme. XY inheritance gives human female choice a key role selecting smart resourceful partners because males are single X which selects strongly for a number of good X brain genes, fig 132. Consequently the variance of male intelligence is significantly higher than in females. Meiotic sexuality causes all organisms to be biologically mortal but endlessly varied. This results in a sexual red queen race between parasites and prey, so meiotic sex may be originally have been a defence by hosts against parasites, but it also avoids Muller's ratchet of parthenogenetic mutational decline. Even the oldest parthenogenetic rotifers use horizontal transfer to gain new genetic "blood".

Sperm-ovum sex is an express consequence of cosmic symmetry-breaking. The mandala of the symmetry-broken forces of nature gives rise to fractal molecules, among which are archetypal expressions of this symmetry-breaking. The symmetry-breaking is evident in sperm-ovum fertilisation in a similar way to the apparently universal basis of the use of cosmologically-abundant glutamate and GABA as in the Murchison meteorite as the primary excitatory and inhibitory neurotransmitters across the entire metazoa. Sperm-ovum fertilisation, fig 62b, evolved in single-celled eucaryotes as a symmetry-breaking to resolve destructive cytoplasmic warfare between the maternal and paternal mitochondria that could kill nearly all of them, so our energy batteries, the mitochondria and the primal cellularity and cytosol comes exclusively down the maternal line.

The single celled alga Chlamydomonas illustrates this phenomenon. Most of its life cycle it is haploid. It is only diploid when two haploid cells fuse. Fusion can only occur between a 'plus' type and a 'minus' type (which can be regarded as distinct male and female gametes) but both types have cytoplasm and cell organelles such as mitochondria and chloroplasts. When two Chlamydomonas cells undergo sexual reproduction, the haploid nuclei fuse, become diploid, undergo meiosis and become haploid again. Meanwhile, however, a 'war', or better, a genetic conflict breaks out. By means of restriction endonuclease enzymes, the mitochondria of one individual 'kill' the mitochondria of the second, whilst the chloroplasts of the second 'kill' the chloroplasts of the first. The process wipes out 95% of all chloroplasts of both types illustrating how destructive the process is.

Fungi get around the need for sperm-ovum symmetry-breaking by using conjugation where only the DNA is exchanged so they can have up to 20 different sexual mating types depending on sex determining genes in the different strains.

Joshua: Chris, I wish words like ethical, unethical, moral and immoral were less superficial, trickier, immoral and unethical, and since I am aware of your observations, the only words that come to heart and mind are: I AM the source of all ethics, the cosmic ethics, I AM I AM the source of all Peace, I AM

Chris: I agree with you about the subjective principle of messianism which involves: (1) the mystically awakened subject realising that they have within their consciousness the unveiling of reality and (2) the responsibility to communicate this to the world as a redemption of the existential crisis, because any one awakened being can become the vehicle of salvation.

This is not just a product of Zion, but an archetypal stream that Jung and Joseph Campbell have well described in “The Masks of God” that show the returning hero, in all his often tragic personae, from Orpheus, thorough Adonis to Tammuz-Dumuzi, to Dionysus, to Krishna and Shiva, to David and Solomon and on to Jesus. They are the avatars of the heroic male, throwing open the doors of perception and fulfilling the karmic cosmos in the great unveiling. Qualifying this as a figment of patriarchal illusion is not to deny Brahman, or moksha, or the spiritual noosphere, but to reveal nature in all her glory. The problem with the use of ethics in the mystical context is that ethics is a product of language and culture, not cosmic consciousness. If it was, the entire natural universe would be founded on ethics and morality and it's clear that it is not empirically on any level, from the quantum to the cosmos, with natural life in the middle. But we can solve this if we develop a cultural ethics that respects biology, sexuality in all its dimensions and sustainable biospheric ecology.

The first step in my visionary upbringing in my adolescence was my dream of the lion. The world was parched and I was standing in patch of wilting vegetation. There, looking at me in contemptuous sadness and pity was the lion knowing that I, a member of *Homo sapiens*, was of the species laying waste to the natural universe. I knew I had to leave and return to my culture, but when I did, it was a dark polluted factory city and I had to stand forever in a queue for menial work to belong, never getting the a place in this world, or even any hope of sustenance.

I recognise that unless I accept the lion for all its carnivorous being, standing all too close to me as I dreamed, not to simply lie with the lamb, I would be living in human delusion, grovelling on the factory floor, while the world darkened around us. Yes it is a huge irony that the circle of life involves eating other organisms to survive, but that's how negentropic energy stays far from equilibrium, so we have to live with it. We can choose as enlightened mortal beings to be ever-compassionate of the mortal coil and empathic of all sentient beings struggling for existence within it, but we can't fairly decide to impose cultural rules on our own free choices as natural living agents in the name of a Creator, or we are committing the original sin of the forefathers. Peace is an enlightened choice but it can't be imposed by ethics or morality and remain a true visionary tradition, because it identifies ultimate good with ultimate order, but life and consciousness thrives only at the edge of chaos. There is no way around this and it is illegitimate to assert a pure spirituality that claims to transcend the natural existence that gives it life.

Moses saw the burning bush and became fascinated and saw I AM THAT I AM – the abstract vision of the cosmic self. This is an experience of the living biota discovering cosmic consciousness in the first person. Our oldest founding culture, the San, practice the trance dance and regularly enter such states. They have enigmatic lines on their cave drawings, fig 163, that express its transcendent arc. The question is what we do with it.

Religions start out visionary and personal, afire with the animistic aura of mystical vision, but then they become dragged into utopian agendas of world domination, and damnation for the very moral transgressions they imposed. I'm sure ethics has a better look than moral imperatives, but culture can't define nature because it is a product of nature. It can influence it, but is unstable in evolutionary time scales. The I – AM is a natural experience of the subjective biota in the living universe, not an absolute deity. The fact that you and I and Moses can see the same Brahmanic entity, but Moses stated the Ten Commandments that gave us Monotheism, doesn't make it right. We need to move on in the epoch of biospheric crisis. We can't just go back to the apocalypse of Jesus in the nuclear age of ecological mass extinction. We have to do this right for nature, for the biosphere and for the living universe that we have only just discovered as a culture, through science itself.

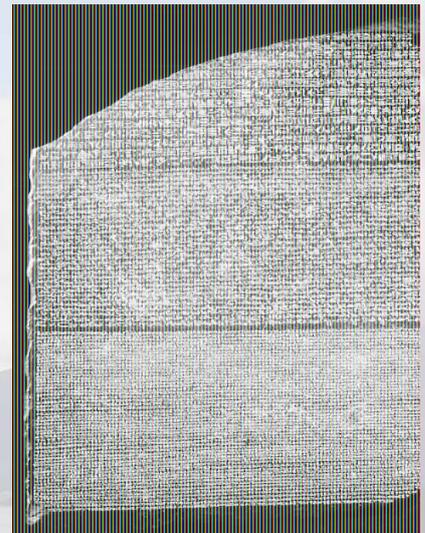

When I went to Jerusalem, I was still heavily into the male messianic paradigm, but fortunately my namesake and partner Jane King was a Wiccan woman who brought Gaia to the table, so we pronounced the anointing of the collective mashiach in the names of both God and Gaia and celebrated both reflowering the Tree of Life and the sacred reunion of woman and man in the Song of Songs in the Millennium, right in the so-called city of peace Yerushalayim.

Now there is more to this, because here I am this week dealing with Gaza and nukes and saying the same thing over again, to give sovereignty back to the female, as Chaucer’s “Wyfe of Bath” declares. Moreover I am NOT a male messiah as such, but an end of days avatar pronouncing the culmination of the apocalyptic patriarchy, in the era of long term future goodness of the Tree of Life, returning sovereignty to the immortal female line, carrying the sacrament of the sacred mushroom, *teonanactl*, the Flesh of the Gods, which Gordon Wasson called “The Divine Mushroom of Immortality” (Furst 1972), so I am renouncing the messianic title in pronouncing its fulfilment.

Neither do I just come across as some shamanistic pretender, high on psychedelics, expressing archaic talk about the nature of tooth and claw in the jungle, but a dedicated and devoted cosmologist recognising the living universe in all its natural and experiential glory, with Symbiotic Existential Cosmology being a natural scientific Rosetta stone, so that others can follow Ariadne’s thread to find their way out of the labyrinth of the existential dilemma. But still of the natural jungle, lying in the long grass in the moonlight, listening to the little breezes shiver among the singing grasshoppers, nevertheless of the nature of tooth and claw, of birth and death, of naked lunch on the dew of the lawn of time, of our hour of splendour in the grass of sexual oneness that is the source of all ongoing conscious life, so that life and existence can survive throughout our generations forever. How can I be a male messiah, while simply being one of many bearing the sacred mushroom of the immortal biosphere, returning sovereignty to the female?

Fig 292c: Symbiotic Existential Cosmology is a “Rosetta Stone”, both translating the languages of science, nature and visionary experience into one reality to provide an Ariadne’s thread for the vision quest and to translate the sanctity of woman, life and freedom throughout the biosphere into every language on Earth.

I am not lightly pronouncing the end of patriarchal cultural dominance, to give back sovereignty to the immortal sex, as a simplistic solution to a complex problem. There are many other factors in the complex dynamics of culture, as my daughter Arwen just pointed out. But patriarchal cultural dominance is a/ the prime causative precipitating factor in our entire existential planetary crisis, because it puts the entire world view and psychodynamics of human culture into a highly skewed, male risk-venture exponential dynamic which is biologically unsustainable – our prime core risk of precipitating ultimate Fermi extinction from all causes.

So the quickest way for humanity to resolve cultural and biosphere apocalypse is to realise the rallying cry “women, life, freedom” in a coalition of the next and coming generations of children and adolescents with their mothers to coalesce with men who recognise the need for facilitating both sexes’ reproductive investment strategies, right through to professional, business and leadership positions to be on the human evolutionary basis of strong female coalitions pairing with men of cooperative and protective intent to redeem the biosphere and resolve the climate and nuclear crises as human society’s primary existential meaning in existence.

It’s not the only factor in cultural apocalypse but it is the key to untying the Gordian knot. We have to be honest that this IS the smoking gun of our cultural existential crisis, so addressing it is the quickest, most effective way, of ensuring our survival, while at the same time taking into account the complexity of cultural factors leading to destructive militarisation and business as usual tragedy of the commons. And it doesn’t involve what we SHOULD do but simply what we in our best conscience know we NEED to do for the entire living universe and for us to have tenure within it.

Here is how I think ethics actually can help bring peace. Cultural evolution is faster and more unstable than biological evolution, so for humanity to survive, ethics needs to be developed on the biological, sexual and ecological principles that sustain an immortal biosphere, while at the same time expressing cultural and visionary notions which emerge from the living universe. Ethics comes unstuck if it ends up cementing a schizophrenic cosmology in which men, fearing their own mortality and seeking eternal life, subjugate women to FGM, Stoning Sutte, Bride Burning and Honour Killing and so on and so on ... leading to unsustainable religious moral imperative cosmologies.

Fig 292d: Women’s Protection Units (YPJ) fighters in the Afrin Region during the Turkish invasion of Afrin in February 2018

The rallying cry "woman, life, freedom" in the Iranian oppression of women over the veil has an intriguing ethical underpinning in the Kurdish women's movement that was pivotal in defeating ISIS and stopping the genocide of the Yazidis and it is founded on sustainable ecology and an inclusive male-female free society in which women are the key to sustainable peace in decentralised direct ecological democracy. So here we do find ethics and even armament acting in the sustainable interests of planetary peace. Here is a short summary reflecting Wikipedia's own short account:

An example of a social system in which women are regarded as pivotal to the liberation of society is the Kurdish Autonomous Administration of North and East Syria, under the principles of Jineology, proposed by Abdullah Öcalan (2013) who has said "a country can't be free unless the women are free", and that the level of woman's freedom determines the level of freedom in society at large:

The extent to which society can be thoroughly transformed is determined by the extent of the transformation attained by women. Similarly, the level of woman’s freedom and equality determines the freedom and equality of all sections of society. . . . For a democratic nation, woman’s freedom is of great importance too, as liberated woman constitutes liberated society. Liberated society in turn constitutes democratic nation. Moreover, the need to reverse the role of man is of revolutionary importance.

In Kurdish, the word jin (ژن) both means "woman" and comes from the root jîyan (ژن), meaning “life”. Jineology, the “science of women”, a set of principles that includes the rejection of the nation-state system, governance through democratic confederalism, and the promotion of self-sustainability through ecological awareness and collective armament, has been embraced by Kurdish women. While these principles are seen as a means of challenging patriarchy, they are also viewed in contrast to Western feminism, which is associated with capitalism and statism. Despite this, the jineological principles embraced by Kurdish women are concerned with challenging patriarchy and the intersection of patriarchy with other forms of hegemony. The Jineology-based agenda of "trying to break the honour-based religious and tribal rules that confine women" is controversial and overcoming controversy in conservative quarters of society in northern Syria and has played a pivotal role in women fighters in the YPG and women’s YPJ overthrowing Islamic State.

It is built on the principle that without the freedom of women within society and without a real consciousness surrounding women, no society can call itself free. It is seen as superior to Western feminism because it aims to reject

all forms of hegemony, including patriarchy and positivism, in order to establish a more sustainable peace. This is because jineology is seen as more holistic and inclusive of all members of society. During the Rojava revolution, both men and women were required to study jineology and ecology, and it is integrated into the region's governance model rather than being treated as a separate issue focused on women's rights.

The Great I AM, Cosmic Consciousness, Conscious Life and the Core Model of Physics

In the light of the above conversations, I've come to a new synthesis of cosmic reality and belief in the light of research on intuitive versus rational modes of thought, which suggest belief in God is a function of only some modes of human ideation. While it's appealing to holistic spiritual claims that religious belief is intuitively divine, the idea that it also lacks rationality, suggests it is a product of only some types of organismic ideation and experience. This implies divinity cannot be physically absolute, for example in the creation of the universe, as we also suspect from the conflicting diversity of religious beliefs, leading to holy war.

First let's look at Yeshua's **I AM** (Joshua Davis). This is a legitimate messianic affirmation of the self as cosmic subject, because the visionary insight of a single inspired person can become a source to unveil ultimate reality to all.

Jesus said something similar in the Gospel of Thomas (77): **It is I who AM the ALL.** From me did the all come forth, and unto me did the all extend.

Fig 292e: Burning Bush Tree of Life [Deana Harvey](#)

But then Joshua extends it to the **Creator** – "**I AM** the source of all ethics, the cosmic ethics, **I AM**. **I AM** the source of all Peace, **I AM**". In its original form this is **Ayer Asher Ayer** – **אני זה שאני – I AM THAT I AM**, that Moses pronounced witnessing the burning bush. This is YHWH **יהוה**, saying that he is what he is, so Moses has transferred his subjective self-certainty explicitly onto his vision of reality, as an external absolute cosmic deity. Yeshua is doing the same.

Then we come to Deepak claiming **I AM THAT** which is **Tat Tvam Asi – तत् त्वम् असि** or **THOU ART THAT**. This is subtly different, saying I (the self or atman) am THAT (cosmic Brahman) – transferring the rishis' self-certainty onto ultimate reality in the abstract. Deepak is doing the same.

These come from different traditions, one about the Monotheistic God and the other about Upanishadic cosmic consciousness expressed abstractly as Brahman, although it can also be viewed personified as Ishvara/Ishvari, which is similar to the monotheistic plural 'Elohim, sourced in the common Indo-Aryan tradition. This development from the earlier theism of the Vedas was a stroke of genius of the Upanishadic rishis, who thus managed to separate ultimate reality from an anthropomorphic deity, neatly sifting the cosmological wood from the trees, but the expressions clearly have a common source we need to unveil.

Starting from Descartes cogito, in which rational thought, rather than "divine intuition" is dominant, we can also step back into the intuitive subjective to rediscover the **I AM** in existential terms:

Cogito ergo sum

I think therefore I am

Experior, ergo sum, experimur, ergo sumus.

I experience therefore I am, we experience therefore we are!

Existo ergo sum

I exist therefore **I AM** ⁹⁰

What we know, which is indisputable and the foundation of conscious existence, is that 100% of our knowledge of reality comes from our wholly subjective experiences, in dreams memories and reflections, as well as subjective sensory observations of the objective world around us, , so we learn to understand the physical world by subjective

⁹⁰ exist (v.) "to have actual being of any kind, actually be at a certain moment or throughout a certain period of time," c. 1600, from French *exister* (17c.), from Latin *existere/existere* "to step out, stand forth, emerge, appear; exist, be" (see existence). "The late appearance of the word is remarkable" [OED]. Middle English often used *ibēn, ibeon* (based on be) for "to exist."

inference through our common subjective observations of it, and thus come to realise that our survival as conscious sentient beings in the natural world is dependent on not getting eaten by lions or bitten by poisonous snakes. But the motivating core is and remains 100% subjective.

So what clearly happened is that the rishis, immersed in deep samadhi, which at least to some degree liberated their doors of perception from the evolutionary filters of animal survival, construed an insight that their conscious experience, which had now become able to meditatively experience itself, in turn became projected onto the physical universe, which became not just the individual atman, or self, but the universal cosmic consciousness they called Brahman, the ultimate reality of the entire universe. This became a possible conclusion because their organismic consciousness was running free and unattached to perceptual reality. Only the first part of the notion – that consciousness is subjectively primary, was empirically correct, but it became extended to the non-empirical conclusion of full consciousness being assumed to be cosmologically primary and hence intelligently invoking the universe.

In the same way, Moses, in his visionary state, akin to those of William Blake, perceived the bush shimmering with an unworldly prescience and likewise named the experience as the entity YHVH, again in equivalence to his own untethered transcendent first person, projecting his own visionary state onto that of an absolute abstract deity, eclipsing Jacob's simple erections of stone at Bethel.

But this transference of untethered subjective experience onto the world at large has no actual empirical or cosmological basis. Both Moses and the Upanishadic rishis were visionary figures in a state of spiritual trance, or transfixion and, just as no combination of objective physical attributes can constitute private subjective experiences, neither can any subjective trance state be construed to generate primordial cosmic consciousness throughout the physical universe, or generate the objective universe itself from subjective consciousness of it, nor can it be construed to form a creator deity, omniscient, or omnipotent, over the physical universe. No matter how convincing subjective experiences can be, given self-certainty of belief, there is no empirical basis from within subjective consciousness to establish any such objective notion or cosmic consequence, unless it is verified objectively as physically evident.

Therefore, as we have to know in our heart of hearts, this means that cosmic consciousness and the notion of absolute deity are similar projections of exalted subjective conscious states onto the physical universe at large. This doesn't mean they are completely unreal, or simply ephemeral superstition, but that they have contingent reality status in subjective consciousness and need to be seen for what they are, as subjective aspects of certain conscious states of living organisms appearing, with the metazoa, very recently in cosmological and evolutionary time scales, and not coeval with the cosmic origin, nor absolute on a cosmological basis. Neither does it make the cosmos any less transcendent. The empirical reality that lies before us clearly makes the living subjectively conscious biota transcendent in just the way religious traditions seek, and the vision quest remains just as valid, but in its becoming in us, as climax conscious beings and in future conscious beings that may evolve if we preserve the diversity of life, unveiling the intimate knowledge of reality in and of itself, thus allowing the universe to fully come to experience itself.

The notion of objective reality itself is even more recent. Humans, from the dawn of history have seen reality through their subjective experience of it, while negotiating the slings and arrows of outrageous fortune to survive and reproduce, and because all the existential threats and social benefits were from other subjectively conscious agents, or live phenomena like storms, we attributed conscious agency to everything around us as a good intuitive bet for our security of survival – i.e. humans emerged as animists. From there, cultural speculation led to culture-wide streams of idealism – that subjective consciousness, thoughts and ideas were reality itself – originally credited to Plato but appearing also in Vedanta, and Buddhism, and through Philo and Paul, in the Hellenistic Judaic Logos of Pauline Christianity and Gnosticism. It is accompanied by skepticism about the possibility of knowing the existence of anything that is independent of the human mind. In transferring subjective experience onto the universe, it makes the complementary category error to pure physicalism that is the basis of all major religious traditions as well as much of historical philosophy.

Subjective consciousness is holistic. It has to be, to provide a unified stream of tactical experience to guide the agent's coordinated behaviour towards survival in direct real time crises which are very much about gut reactions, and at best intuitive judgments that often don't allow the time for complex reasoning, leading us to act upon that which feels right to the experienter.

With the advent of cultural inventions, from toolmaking, through arrow poisons, knowledge of food and medicinal plants and inventions like the wheel, our analytical prowess became sharpened and amplified into what we now know

as physical and biological science and technology, so we are now overwhelmed by a second mode, of analytic thinking that is sceptical in its basis and runs counter to magical intuition.

Everything we know about subjective consciousness indicates that conscious states are optimally integrated, in notions like the global neuronal workspace, to achieve a unified stream of consciousness. But there is a deep problem with intuitive insights and that is that they work really well on hunch in most situations, and are central to the vision quest of subjective consciousness, but can make fatal errors if misapplied in a way which lies outside any evidence from either direct subjective experience, or our perceptions of the world. Just because samadhi is bliss, doesn't mean it is moksha, falling outside the incarnate, and even moksha needs unbiased empirical affirmation to become a working hypothesis. Moreover, the advent of doctrinal religion has shown us that even billions of adherents don't establish that a religion, or a spiritual belief is true, or that God is real, due to infectious cultural memes of affirmative belief.

Now supposing we wanted to test the credibility of the idea that a super-conscious agent or entity created or designed the physical universe by conscious means, we would have to address the thorny problem of the core model of physics, involving the four known forces of nature, which we have yet to discover any real evidence of divergence from, with the discovery of the Higgs boson in the LHC, although many of the parameters are still unexplained. What is outstanding about the standard core model, including gravity, is that it doesn't look at all like an arbitrary piece of intelligent design, but a cosmic mandala of symmetries and symmetry-breaking that puts to simplistic shame, even the beloved Shri Yantra of Shiva, and Shakti, encompassing the experiential and physical realms.

Fig 292f: Left: Shri Yantra represented by Shiva's lingam upper triangles and Shakti's yoni in copulation representing subjective consciousness and the natural world. Right the standard model surrounded by gravitational influences involves complex underlying symmetries some of which are broken in force divergence.

To understand how unique and idiosyncratic the standard model is, we can start with gravity and electromagnetism, which are both evidential in subjective experience, as both magnetism and lightning on the one hand and Newton's apple falling, on the other. We can also witness runaway chemical reactions in fire but didn't know these were also electro-magnetic until recently. Otherwise our personal experience was largely confined to biology and geology

including the use of fire to extract metals. Although Democritus speculated on atoms philosophically, the first experimental evidence came with Brownian motion in the 19th century. Now we know there are around 100 chemical elements and that for life to exist based on stable atomic nuclei, we need this number before nuclear instability makes larger nuclei impossible. We now know that all living systems are based on complex organic molecules using essential bio-elements from a core of H-C-N-O all the way up to iron with peak nuclear binding energy, and on to fifth row molybdenum, essential for fixing nitrogen.

Fig 292g: The core model of particle physics in more detail.

The fundamental particles are divided between the matter-forming fermions of spin 1/2 and the integral spin bosons, connecting the fermions in radiation and force fields. For atoms to remain stable, and to have strong enough chemical bonds to make biomolecules, places two conflicting demands on fundamental particles and forces. At the same time the nuclei have to contain huge binding energies to give stars their long lived energy essential for planetary life. Hence the baryons consist of triplets of quarks with 1/3 or 2/3 of the electron charge, which compensating for their 1/3 charge, bind in triplets of 3 colours, giving rise to the gluons and strong nuclear force between protons and neutrons, giving them their high masses and the energy that powers stars. In a universe with only protons and electrons, almost no nuclei would be stable because the electromagnetic repulsion of a proton-only nucleus would drive them apart. Thus we need both positive protons and

neutral neutrons to combine to form the nucleus. But this invokes the weak radioactive force, because balancing the fermionic $1/2$ spins requires neutron decay to emit a proton, an electron and a ghostly anti-neutrino. Hence we have a mandatory four forces involving charges in pairs, positive and negative, matched by 3 colours of quarks and three anti-colours, which also have to come in two flavours of triplets uud for the proton and udd for the neutron, matched in turn through the weak force to two flavours of leptons, positive and negative electrons and the neutrinos, resulting in a symmetry breaking where, in addition to the massless neutral photon, we have massive weak force W_{\pm} and neutral Z_0 bosons, that are otherwise like photons.

The fermions even have an underlying archetype in the rishons (primary in Hebrew) **T** for **Tohu** (unformed) with charge $1/3$ and **V** for neutral **Vohu** (void), so the positron and neutrino are TTT and VVV and the TTV, TVT and VTT are the three colours of up quarks and VVT, VTV and TVV are the three colours of down antiquarks, where order is important.

All of these symmetries and their breaking appear to be structural requirements of any remotely plausible set of forces of nature giving rise to a universe in which conscious life could exist as a fractally climax quantum system and they conform to symmetries and show no evidence of an arbitrary design that an intelligent designer would have any real options over. That said, we are still short of a fully elucidated TOE or theory of everything, with higher dimensional super-string theories failing to compactify uniquely into a universe like ours, amid the failure of super-symmetry to come to the rescue, as a hopeful, but probably unlikely, simplification of the idea that positive and negative vacuum energy of the bosons and fermions cancel one another in simple pairs of like kind, although at face value, the bosons and fermions have very different incidences, fig 292g, combined with a failure to unify gravity with the other forces.

In addition there remain the problems of fine tuning of the cosmological parameters, although these might disappear in a more fundamental underlying TOE. The standard model has 25 freely adjustable parameters and general relativity has the cosmological constant, which is known to be nonzero but profoundly small. Some of these are very sensitive. For example, the ratio of the electromagnetic force to the gravitational force between a pair of protons, is approximately 10^{36} . If it were significantly smaller, only a small and short-lived universe could exist. When four nucleons fuse into helium, 0.007 (0.7%) of their mass is converted to energy. If it were 0.006, a proton could not bond to a neutron, and only hydrogen could exist, and complex chemistry would be impossible. If it were above 0.008, no hydrogen would exist, as all the hydrogen would have been fused shortly after the Big Bang.

Thus although we don't have a final TOE, the forces of nature are shaped by symmetry and symmetry-breaking principles with no evidence external imposed design is necessary, or even feasible. In addition, although we know the energy processes of the universe, both nuclear and ultimately gravitational dominate the universe's evolution in space-time, leading to a big crunch, or heat death, it is equally clear that the universe rises to climax complexity in planetary life, fed by the free energy of solar radiation to invoke a negentropic planetary regime that, given the galactic distribution of key organics such as amino acids and nucleotide precursors, including our two primary excitatory and inhibitory neurotransmitters, glutamate and GABA and strong empirical evidence for biosynthesis routes for biogenesis (King 2020a), that in the example of our own planet Earth, has given rise to the emergence and evolution of increasingly complex multi-cellular life, which in the metazoa has come to manifest subjective consciousness in the universe. Evolution, given its massive evidential confirmation, genetically, geologically and archaeologically is an empirical fact of life. The sheer creativity of evolution transcends any concept of intelligent design. Thus taken at its face value, given the cosmological generality of organic molecules in galactic gas clouds resulting from previous supernova explosions, and the ubiquity of Earth-like planets in our galaxy, conscious life has central status as a climax manifestation of cosmology mid-life on the universe's cosmic "equator" in space-time, through the biota.

Although subjectivity is a primal complement to the objective world, as the shri yantra shows, it is life and conscious life that is the physical embodiment of all our notions of cosmic consciousness, with full consciousness arising late, in the universe's organic and biological complexity climax, in the eucaryote endo-symbiosis, that finally makes full self-awareness possible. Into the largely untapped subjective realm are drawn all our diverse experiential notions – of transcendence, immanence, the numinous, spirituality, deity, the vision quest, samadhi, moksha, the Tao, Tantra, psychic experiences, the notion of eternal life, dreams, and the dreamtime and above all psychedelic visions, which provide a uniquely rich empirical basis to assess and gauge all these other subjective manifestations and assumptions.

Unlike the rest, psychedelic visions are rich, ornate, confounding and veridically experienceable in the waking state, so they provide an empirical core for the discovery of subjective reality that parallels that of objective science in the physical realm and constitutes the equivalent to the LHC in particle physics for the discovery of non-ordinary conscious

states. Without psychedelic experiences, subjective reality would remain hostage to pre-conceived beliefs. That is why I see them as central and necessary to the wider science of subjective conscious experience.

It is life in all its diversity that is the physical embodiment and climax expression of cosmic consciousness, encapsulated and entwined in our organismic awareness. To neglect or deprecate life to cosmic consciousness is ultimate suicide.

The Cacophony of Deity: The Gods and Philosophers can't All be Right, Here in the Physical Universe.

Kashyap pursued the late origin of consciousness against the primal cosmic mind. When faced with Vinod's and then Deepak's mind-first consciousness-makes-the-universe, I realised that, in the sturm and drang of philosophical and quasi-religious debate, Kashyap's sheer resistance is necessary. So in my burning bush piece, I turned the tables, to put down a red line in the philosophical sand, that consciousness-only-rules is wrong for the same reason pure physicalism is wrong, because consciousness and physicalism are categorically distinct and no combination of one can make the other, particularly at the cosmic origin long before these insights. Full consciousness, as we know it, comes late with the evolution of the biota although SEC is primally panpsychic with primal subjectivity.

I also agree that science is fundamentally "of the empirical method". We disagree, in that I consider 1pp for subjective empirical investigation is the complement of the physical sciences' empiricism of verified observations by independent groups, in the vision quest method of mutually-affirmed empirical experience. That said, religions, and here I include both Vedanta with "consciousness rules okay", that denies biological species any meaning at all; and Monotheism, with it's clockwork orange "divine watchmaker" creationism, that leaves life creatively sterile; both violate all principles of unbiased empirical affirmation of 1pp experiences, violating independence and constituting bias.

To suggest that religious affirmation is unbiased would mean that two very questionable deities, the Christian Abba who sacrificed his only begotten Son to forgive our sins in time for the Day of Judgment, and al Llah the ancient Arab deity, who was originally paired with al Lat, the primal Arabian Goddess, but then summarily cast by Muhammad into oblivion in the "satanic verses", would imply there are two real deities ruling Earth, Abba and Allah, with a posse of Hindu gods and goddesses, from Vishnu to Kali, circling around in pursuit, leaving the Hebrew YHWH, lost in the population crisis by comparison, not to mention all the other "fictitious" deities worshipped by Wiccans, to the Tree Spirits of the Amazon shamans. Right now, since Christianity is still the biggest, so Abba could be said to rule the world, but Allah is coming up fast, amid terrorism and the endless rumours of holy war over utopian planetary supremacy.

No they can't all be real, so none of them are, as things stand. Yes we know about the perennial philosophy that God is a subtle changeling, that morphs and adapts to changing realities and keeps knocking on the back door of our conscious minds, trying to seduce us into believing in him through his subtle presence, so he is there if our minds are "open", but this is also a fantasy of human fallibility, based on affirmative belief, and moral imperative, not empiricism. As I see it, philosophy ⁹¹ is in the same boat because philo-sophia is, despite being "the love of wisdom", essentially the art of argument and debate, in which every point of view rules okay? Monism, dualism, IDAM, physicalism,

⁹¹ **philosophy (n.)** c. 1300, *philosophie*, "knowledge, learning, scholarship, scholarly works, body of knowledge," from Old French *filosofie* "philosophy, knowledge", from Latin *philosophia*, from Greek *philosophia* "love of knowledge, pursuit of wisdom; systematic investigation," from *philo-* "loving" (see **philo-**) + *sophia* "knowledge, wisdom," from *sophis* "wise, learned;" a word of unknown origin [Beekes]. With many spelling variants in Middle English (*filozofie*, *phelosophie*, etc.). From mid-14c. as "the discipline of dealing in rational speculation or contemplation;" from late 14c. as "natural science," also "alchemy, occult knowledge;" in the Middle Ages the word was understood to embrace all speculative sciences. The meaning "system a person forms for conduct of life" is attested from 1771. The modern sense of "the body of highest truth, the science of the most fundamental matters" is from 1794.

religion (n.) c. 1200, *religioun*, "state of life bound by monastic vows," also "action or conduct indicating a belief in a divine power and reverence for and desire to please it," from Anglo-French *religiun* (11c.), Old French *religion*, *relegion* "piety, devotion; religious community," and directly from Latin *religionem* (nominative *religio*) "respect for what is sacred, reverence for the gods; conscientiousness, sense of right, moral obligation; fear of the gods; divine service, religious observance; a religion, a faith, a mode of worship, cult; sanctity, holiness," in Late Latin "monastic life" (5c.). Derived by Cicero from *relegere* "go through again" (in reading or in thought), from *re-* "again" (see **re-**) + *legere* "read". However, popular etymology among the later ancients (Servius, Lactantius, Augustine) and the interpretation of many modern writers connects it with *religare* "to bind fast", via the notion of "place an obligation on," or "bond between humans and gods."

resplendence (n.) "vivid brightness, brilliance, splendor," early 15c., from Late Latin *resplendentia*, abstract noun from present-participle stem of Latin *resplendens* "brilliant, radiant". From *re-*, here perhaps an intensive prefix, + *splendere* "to shine, be splendid".

panpsychism, elimanativism, illusionism and all. There is absolutely no empirical reality emerging from this multiplicity of views.

So I support two empirical traditions, objective science and the subjective vision quest, in the paradigm of **resplendence**, replacing the bondage of **religion** to affirmative belief and imperative morality. I have to be utterly definite to make this division and oppose violations on either side, because otherwise Maya, the whole cabal of illusion, will overwhelm us, with subtle arguments and affirmative beliefs that have no evidential validity.

Kashyap: About religion courses, U.S. the constitution requires separation of church and state. State universities cannot teach a course in theology. Also they cannot give a course in just Christianity. When a course on religion as scholarship is given it has to cover all the religions!

I'm sorry to have to be the grim reaper, but we have to be honest with ourselves about where this is heading. How can anyone, from a benign Unitarian to a fire-and-brimstone Brethren, or a Pentecostalist speaking in tongues, believe such a violent, confused and vindictive cosmology as that God sacrificed his only begotten Son in a deicide and eat his flesh and drink his blood, in perpetuity, in every canonical Christian following on Earth?

How far do we take this? To Allahu Akbar? To the Aztec sacrifices? To the blood of the Crusades? Or take literally the advice of Krishna to Arjuna to kill his brethren to uphold the divine covenant, as those watching the Trinity test had to do? Do we now all take hostages and bomb the living daylights out of one another, or nuke them for good measure? Where do we take a breath and actually, with some care and no preconceptions learn to look truthfully at the Kingdom that lies before us but men do not see?

I AM happy with **I AM** as a revelatory affirmation. But **WE ARE** is the beginning and end of the story at this point in our existential unfolding. I "believe" religions can in principle save the world, as well as destroy it. Why else would I have taken this tortuous and improbable route to redemption? But it will work only if the paradigm of apocalypse becomes the epoch of paradise, by shifting the reference frame to the immortal survival of conscious life throughout the universe. This is what constitutes living peace. It is the true redemption. The meaning of conscious existence and the meaning of life in the mortal coil.

The trouble with God is that It/He/She is a surrogate for our own responsibility for the fate of the universe. The "Idea of the Holy" has been part of our growing up, but we become the godhead through the redemption of conscious life. That's the sadhana that Brahman taught me for He/She/It's own future survival, as the living cosmic consciousness, through which we become divinity. This has to be experienced in the first person, which is why the mushroom. The moment it becomes taught as theology, it becomes fatal doctrine.

Once we invoked nukes and the other features of planetary apocalypse, the buck passed to humanity as adults. We have to take the consequences fair and square right now, no longer through the dark glasses of religious belief. Once we get the good work done, the 'Elohim can begin to become realised. That's the eternal sadhana in space-time.

The historical process by which Christianity's sacrificial error occurred and how it became a contrived "false" religion is set out briefly as follows, related in detail in other sections. It's a real warning to everyone about ALL religious ideas, which is why I am drawing a red line of blood in the sand of history about consciousness making the universe:

(1) Jesus was an innovative free thinking wild apocalyptic and gnostic preacher whose mentality is best understood in the Gospel of Thomas. He may also have had aspirations to heal the Hebrew faith with the resurgent fertility worship and Dionysian beliefs in Nabatea in his lifetime as the Gospels seem to indicate. Ironically, according to Josephus, the Baptist did have his head served on a plate in the descent of Inanna performed by Salome at Herodias's behest, so Jesus' fertility sacrifice anointed by Mary to his doom has a weird karmic "reality"

(2) Three decades after his death for insurrection and blasphemy, Paul, strongly influenced by Hellenistic Judaism staged a born again revival of Christianity in which he crafted the life of Jesus into a contrived surrogate religion, in which Jesus became the intermediary between the Father God and humanity, in the Hellenistic Jewish cosmology, adopting the themes of the dying and resurrecting sacred kings of Greek and other fertility cults to explain his life and death. Motifs that are utterly non-Hebrew, like Jesus being anointed by a woman to his doom and performing Dionysian miracles like water into wine may have been introduced or embellished by Pauline allegorical thinking.

(3) This notion comes ultimately from a Hellenistic Judaic model due to Philo, in which the scriptures are thought of as creative mythology, by the use of allegory, in which the characters become figments of a cosmological drama. The synoptic gospels are thus creative glosses of Jesus' life, mission and death, built on a contrived interpretation overlaid on older fragmentary accounts. Philo thought of the cosmos as rather like the Vedantic notion of Brahman as cosmic consciousness, but instead it was cosmic thought called the Logos, which was like cosmological ideas making the universe in the way that Vedantist thinking that consciousness makes matter. In this thinking an intermediary was needed between an entirely formless abstract God and humanity.

(4) Here is where the trouble set in, because the entire process also had to explain Jesus' historical life and gruesome death. Paul then claimed in a vision recorded in his epistles that Jesus told his disciples to eat his flesh and blood in the last supper, giving rise to the notion that without the shedding of blood, there is no remission of sin. This subsequently got redacted into Mark's gospel and then the others verbatim, from Paul's vision and has no basis in historical reality.

(5) This tried to explain Jesus' life and death as the cosmic mediator in terms of God sacrificing his only begotten Son, partly in attempt to reconcile the Greek concept of the logos cosmos with flesh and blood Hebrew history of the Old Testament, turning it all into a cannibalistic blood fest.

The end result is that we have a completely false religious belief system with terrible outcomes, crafted behind the scenes by creative orchestrators of Hellenistic Judaism to evoke a mythical religion which became virally popular in the pagan world where all these motifs were already part of the world view which Christianity was designed to outdo.

The Jewish messiah was nothing like this, but an anointed human, bringing about about an epoch of long-term future goodness, as Jane and I set out to do in the Millennium in Jerusalem and now here I do in Symbiotic Existential Cosmology, but apart from Solomon, the other historical Jewish messiahs have ended up ignominiously.

So much for the messianic tradition!

Nevertheless, time is of the essence to save the living planet from a human-induced destructive apocalypse, so we each have a messianic duty to perform, as I do in writing this passage.

I have a great deal of respect for the Upanishadic and later Tantric traditions of Vedanta. The formative experience resulting in Symbiotic Existential Cosmology was due to sacred mushrooms. I note that Patanjali admitted the "herbs" as bearers of siddhi, and the sacred soma of Indra was at the very source of Indra's power, so this is an integral part of the Vedic tradition.

Now the supreme insight of the Upanishads is that the transcendent can be viewed and experienced either cosmologically as Brahman – ultimate reality – or anthropomorphically as the personae of Ishvara/Ishvari as personified divinities. This is clearly a choice, not an absolute fact of a divine power.

In my experience of union with Brahman, it was somewhere in between – as ultimate reality manifesting in cosmic consciousness, complete with its transcendent self of overflowing compassion of the eternal for the predicament of the mortal coil. That is, I was one with cosmic consciousness, with the anthropomorphic shadow of divinity, without it being predominant. Given both my own experiences of cosmic consciousness and the very obvious fact that subjective consciousness, including even our spiritual pretensions, has arisen very late in cosmic evolution with the metazoa, the notion of a primary cosmic consciousness that made the universe as a "higher power" lacks both subjective and objective empirical validation.

By contrast, with observable physical reality, from fundamental physics to psychology and neuroscience, the subjective realm of spiritual belief is contingent. The notion that scientists need to be made spiritual runs counter to the fact that 80% of people are religious and religious excesses are historically more to blame for our ecological crisis than science, which has astute sensitive awareness of biological and biospheric realities. It is clear that religious belief is not at all uniform across the human population, so there is no case can be made that a higher power is evident either in cosmological physics and biology nor in individual conscious experiences and preferences of belief.

Vedanta is very much a counterpoint between the unity of Brahman as cosmic consciousness and a profuse variety of deities, from Shiva through Vishnu to Durga, Shakti and Kali, not to forget Ganesh and Hanuman, who are still in reality

ancient human-animal thieranthropes. So the only unity is in ultimate reality, while the notion of deity is rife with dissonance, conflict and sacrifice. It is also not at all just about peace and love, for Krishna in the Gita declares holy war even against one's kith and kin. Nor is there evidence for a single common divine power.

Now there is a very big problem with Hindu culture, that is also shared by Monotheism, is the treatment of the female sex. In our book "[Sexual Paradox: Complementarity, Reproductive Conflict and Human Emergence](#)", Christine and I spelled out that human culture and super intelligence arose from a Red Queen race of reproductive conflict, in which astute female reproductive choice was pivotal to XY-chromosomal evolution of intelligence.

The religious history of planet Earth has been wracked by a succeeding period of patriarchal domination of female reproductive choice that has decimated Y-chromosome diversity due to powerful males dominating reproductive choice, particularly in the name of religions, both by male-male homicide and invocation of lethal punishments for female adultery. So much for religious morality! Hindu culture is rife with patriarchal oppression. Sexual paradox has an entire chapter "[Daughters, Wives and Widows](#)" dealing with the vagaries of hypergamic Hindu culture, rife with child marriage, bride burning, widows in charnel houses living a life of virtual suttee, sexual abuse and severe sexual imbalance due to killing the girl child in the womb.

Indeed this is why, after visiting Jerusalem in the Millennium to reflower the Tree of Life in the sacred reunion of woman and man, I took great trouble to go to Varanasi to pay my respects to Kali as the "Black Madonna" of history, to disband the messianic patriarchy, when my tickets inadvertently had got cancelled and I had to wage war with Lufthansa at Frankfurt airport for three days to get them to fly me into Nepal and then go overland from the Himalayas by bus.

Chris: "My answer is to enter the mysterium without polemics and report empirically on your vision quest without prejudice and see if you can find secular consensus."

Joshua: "My answer is to enter the mysterium without polemics and report empirically on your vision quest without prejudice and see if you can find secular [religious, spiritual and mystical] consensus."

Chris: I like your use of "spiritful" Yeshua, but as usual you are weighting the "spiritual" side as three times as "meaningful" as the secular. This is even more biased than the Quranic statement that the value of a man in law is twice that of a woman. It is the very source of bias in the 1pp empirical approach that means religious belief is fatally unreliable.

The only correct cosmological solution is the following: "My answer is to enter the mysterium without polemics and report empirically on your vision quest without prejudice and see if you can find scientific, visionary and biophilic, consensus."

Joshua: So far it seems that both science and Brahmanic philosophy are facing serious challenges to differentiate and then integrate different levels of reality. This is what the Urantia Book has to say about Brahmanic philosophy:

94:3.8 (1031.1) Brahmanic philosophy has approximated many of the facts of the universe and has approached numerous cosmic truths, but it has all too often fallen victim to the error of failing to differentiate between the several levels of reality, such as absolute, transcendental, and finite. It has failed to take into account that what may be finite-illusory on the absolute level may be absolutely real on the finite level. And it has also taken no cognizance of the essential personality of the Universal Father, who is personally contactable on all levels from the evolutionary creature's limited experience with God on up to the limitless experience of the Eternal Son [-Daughter] with the Paradise Father [-Mother].

About science, we already have pointed out the great limitations of 3pp science when divorced from 1pp, particularly in the study of human cognition, conscious vs. unconscious states, the integration of reason and emotion, and the experience of Cosmic or God's Consciousness resulting in embodied spirituality, and I AM Identity that cares for the sacredness of all life.

Chris: That's cute Yeshua, but all it reflects is the extreme bias [Urantia](#) has for Jesus and Christian notions of the "father God", just as your subsequent passage declares. In fact you yourself have inserted the alleviating [feminine] because Paper 10 "The Paradise Trinity" says it's a boy's club:

The Universal Father, the Eternal Son, and the Infinite Spirit are unique persons; none is a duplicate; each is original; all are united.

This is precisely why religious compilations show enough bias to render their conclusions counterfactual.

There is a deep parallel between Urantia and Symbiotic Existential Cosmology but SEC is sticking to empirical evidence 1pp and 3pp, because all previous spiritual and religious texts have failed to stick to empirical trustworthiness!

Joshua: All Human Beings, ought to seek to understand reality via science, as well as, religious, spiritual and mystical experience, and "enter the mysterium without polemics and report empirically on [our] vision [quests] without prejudice and see if [we] can find scientific, visionary and biophilic, consensus."

I wish you would have read a little more in the Urantia book, since it is far from being a boy's club, and the conceptual framework it portrays is vast. I quote some examples (bold and yellow are mine):

Paper 8 - The Infinite Spirit 8:2:2 (92.3) The Third Source and Center is known by numerous titles: the Universal Spirit, the Supreme Guide, the Conjoint Creator, the Divine Executive, the Infinite Mind, the Spirit of Spirits, the Paradise Mother Spirit, the Conjoint Actor, the Final Co-ordinator, the Omnipresent Spirit, the Absolute Intelligence, the Divine Action; and on Urantia he is sometimes confused with the cosmic mind.

Paper 14 - The Central and Divine Universe 14:6:36 (162.11) And lastly, since these Daughter Spirits of the Infinite Mother Spirit will not likely ever return to their Paradise home, they derive great satisfaction from the universal reflectivity phenomenon associated with the Supreme Being in Havona and personalized in Majeston on Paradise.

Chris: The only thing I can say is that I am prepared to say who I am as an author of SEC, however outrageous it may seem, while the authors here are elusive. It does read rather like Dante's Divine Comedy or the gnostic archons, but it's neither science nor scripture. Why are these daughter spirits not likely to return to their paradise home? Why does that mean they derive great satisfaction and what is a universal reflectivity phenomenon? This all doesn't make any sense except as a CS Lewis fairy tale about God.

I can accept religious scripture like the Upanishads and the Hebrew Bible because it's an account that can be exposed to both historical and cosmological assessment. How do we assess literature that reads as an unspecified author's imaginal allegorical description? Is it fiction or non-fiction? Does it just have allegorical "truth"? If so, what truth?

I can accept allegorical spirits. I see spirits of all the creatures who have ever existed, and feel the spirits of the wind and storms, as an animist does, but this includes life and celebrates life as sacred. It's not the sort of elitist spirituality that others like Paul talk about in the intellectual noosphere and I take it only as seriously as any other experience. It's not for me to tell you what – its for each of us to unveil.

My problem is not with spirituality in its widest sense, but with transcendent spiritual elitism. Animism is a founding human world view which treats all living beings and entities as conscious agents, including edge-of-chaos natural phenomena and invokes all of life in symbiotic awareness confluent with Symbiotic Existential Cosmology. The views of spirituality as complementary to science are a much narrower view of spirit in a transcendent religious context, as opposed to mere matter and the wholly incorrect notion that science is to blame for the existential crisis, which should therefore be solved by the unification of science and established religion. I see this as a false remedy because it leaves life supplicant, is not a redemptive paradigm shift and religion is as guilty as science of jingoistic ascendance.

This brings me back to the source of Pauline Christianity. I have realised that this entire construction that leads to endless flesh and blood of Christ hanging before every church lectern for 2000 years, actually originates from the Idealist thinking of Plato through Philo and Paul. This was an allegorical reality that became violent human history in martyrdom and Crusade. Philo and then Paul thought of everything in allegories so that it became acceptable to think of Jesus as an intermediary with a formless father deity and then that got caught up in dogma that he was both a mortal human and a divine being as mediator. Then it got turned into both the notion that God had had to sacrifice Jesus because that was the allegory of forgiveness of the sins in the all too diabolical Zoroastrian day of judgment and then it got turned into Jesus as Christ being at the very origin of the universe before Adam and Eve.

These are the dire consequences of runaway Idealistic philosophy, turned into visionary doctrine which is subjective experience thinking it is absolute reality. It's worse than pure physicalism by far. It has dire consequences and not just

in terms of sacrificial violence but encouraging martyrdom because we are just spirit beings waiting for eternal life and have to make strategic decisions to martyr ourselves to ensure eternal life, we are thinking of ourselves as not really physical in any meaningful way and physical as damned because Greek world views disdained the flesh, as well as Gnostic world views. But what if the only life we have is the one we have now, as I suspect.

I can't go down this spiritual reification route at all. I have to take the route of empirical integrity. It may seem severe but it's necessary for human survival.

Joshua: yours are questions that we can explore in the context and vocabulary of The Urantia Book

- "Why will they not likely return to their paradise home? "
- "Why does that mean they derive great satisfaction and what is a universal reflectivity phenomenon?"

However, if you have already made up your mind, I respect that.

Chris: This still all pivots on **I AM**. You said: "and the experience of Cosmic or God's Consciousness resulting in embodied spirituality, and **I AM** Identity that cares for the sacredness of all life". It's we all, not just I AM that needs to protect life, but this brings us to a question about what **I AM** is. How far does the subjective extend into the objective?

Vedanta sees this as something that is the completion of our organismic consciousness in **cosmic consciousness**. There is no separation between atman and Brahman. This is completely different from the Western view of **God consciousness**, as awareness of an absolute external abstract transcendent wilful deity independent of our own free will. I'm saying both are wrong in an absolute cosmological sense, because animistic spirituality emerged from the biospheric jungle, late in metazoan evolution. To say anything else is contrivance. Both samadhi and mystical union are real as visionary experiences and they might have supernatural powers, but we don't pre-empt reality with belief.

The **warriors path** has a stringent sense of spiritual integrity. This stringent path is retaining the sense of disbelief and letting the visions overwhelm one in the midst of overpowering numinosity without affirmative belief. I thus think, for all his deceits as a jackal, Carlos Castaneda is right about God fixing the assemblage point and stymying the vision quest. This is a world apart from Richard Dawkins saying God is a delusion!

The Brahmanic moksha in Vedanta is on a continuum. You can interpret union with Brahman as a meeting with the 'Elohim – Ishvara/Ishvari, but it's on a sliding scale of one's own view, so it's not absolute. Moreover the organismic psyche is emotional and personified, so Brahman has all the characteristics of organismic personality and compassion. This doesn't make God real. God is a way of looking at the self, projected onto the cosmos and the karma around us.

We can't go and set off nuclear Trinity and then try to turn to God to save the biosphere. There's no hiding place down there, hallelujah! We have to grow up and wake up now and take cosmic responsibility for our fate of taking a bite out of the nuclear apple of the cosmos. That's the buck. Knowledge of good and evil. We **HAVE** to make good now to protect the tree of life's diversity. It's make or break.

But the point is to keep having intense transformative visions, then we don't need presumptions. The way I do that is very occasionally takingentheogens as deep transcendental meditation, because this is the way to span heaven and earth in a moksha bridge.

The way of samadhi is sparse and referred to as "emptiness". The way of the entheogen is overflowing with experiential and spiritual fullness, but it's also of the earth, of life, and of the unity of all life, and of the insightfulness of the evolving biosphere, protecting itself and us from Fermi extinction. So it really is a mystery! I'm just an earth conductor.

Once the mysterium tremendum of mortally fearful men who, unlike the females of our species, don't give birth to new life, hit the stratosphere, their feet left the ground, because their visionary bodies are too short. In a way, entheogens are the only thing that enables the axis mundi to reach the heavens while planted in the sacred earth. This makes it possible to be a visionary mystic, a rational scientist and a critical sceptic.

Fig 292i: Tree of Life Deana Harvey

The Before, During and Afterlife

Cathy Reason: I have seen Hell in this life, horrors beyond description. Can we really be sure that similar horrors don't await in the after life -- not for karmic or moral reasons, but simply because of random chance? I have seen people in this life having to undergo things I cannot even bring myself to imagine. And one of my nightmares about the afterlife concerns being lost in a trackless wilderness where no path ever leads to any destination at all -- you cannot go anywhere, because everywhere is exactly the same as "here". A mathematician can conceive of the ultimate-escape-proof prison -- a completely closed manifold. In fact, I believe the world of our living experience is just such a manifold, one in which we remain trapped by our psychic entanglement with the living. Who knows what happens when that entanglement is broken?

The reason I am convinced there is an afterlife, is that it is pretty clear by now that consciousness is not an emergent property of the physical world. It's theoretically possible that it springs magically into existence in response to a particular configuration of matter, and vanishes equally magically when that configuration disperses. But that seems extremely implausible. It seems far more likely to me that consciousness is a pre-existing entity which becomes entangled with the living world for a time, and then disentangles from it. But I agree that one might be better off not believing this.

Chris: I empathise with your despondency about being caught in the dysphoric loop of life, but death is not the answer, it's an inevitability. Hoping for an afterlife in death, to escape life itself, is a living tragedy.

Cathy: I was suggesting that while an afterlife of some sort is probably inevitable, it isn't automatically desirable.

Chris: Cathy is right, but she is not saying what you expect and the consequences are completely different from what you assume. We do not possess subjective consciousness, we manifest it. It IS a cosmological phenomenon, which is the culminating expression of the symmetry-broken forces of nature, which themselves are incomplete without the denouement of cosmic consciousness emergent in complex living organisms.

We are ALL conscious, as is life as a whole and this IS an empirical fact. We all verify this by empirical subjective experience every moment of our lives, just as we verify empirical observations externally. We can also empirically verify that we have intentional will to affect the universe around us in our behaviour. But this doesn't mean the existence of an afterlife, in the sense of an individual intentional consciousness, as a disincarnate ego, or soul -- another piece of damaged goods. The very term afterlife is an abuse of life itself.

We are Alive

*We are waves whose stillness is non-being.
We are alive because of this, that we have no rest.*
Abu-Talib Kali

Christo Rey on the Epiphany 2024. When I take mushrooms, it is as if I have become aware of all the living spirits of existence eternally from alpha to omega, because the doors of perception have been flung wide open, but it doesn't mean I have an eternal individual soul. Presume to have an eternal afterlife and we go down the gurgler of delusion. The very compounding of "after" and "life" is the root repression of life emergent to spiritual domination for religious largesse. The afterlife is a spiritual tragedy of the commons that violates the sanctity of life itself. So be here now and forever, in the before, during and afterlife, but remember it is what you do, not what you assume, that will sustain life unfolding or lay it to waste.

Pragmatism On Religion

1. All life survives on energy consumption. Lions and humans are both natural autonomous conscious agents, therefore any form of cosmic morality, e.g. not to kill, is false.
2. Organismic mortality is essential to life. It is the inevitable consequence of the entropic universe, alleviated only by sexual recombination, without which complex life could not exist. Eternal souls are not conducive to living diversity.
3. God and Brahman as the generative cosmic mind, are tokens of cosmic order over chaos, alleged to make the universe, but demonstrably failing, in moral oblivion and decline, from the fecundity of tohu va vohu to Armageddon and the Kali Yuga.
4. Life, evolution and consciousness arise in critical phase transition at the edge of chaos, and unfold throughout our generations, because the ultimate rule of order prohibits innovative escape and becomes stuck in its own oppressive rut.
5. Therefore God, or Brahman creating the physical universe as a state of ultimate good or ultimate order is a contradiction to the emergent conscious universe of life overflowing that we actually observe.

The Evolution of Symbiotic Existential Cosmology

Unified Field Theories and Cosmological Biogenesis

In 1978 I published a monograph on the cosmological foundations for the origin of life explaining life as a climax manifestation. In "Unified Field Theories and the Origin of Life" (King 1978), I described the prototype of many of the ideas you will find in Symbiotic Existential Cosmology. It was a very early attempt, in which I was absorbing many ideas from across the span of cosmological physics, through molecular biology to neuroscience, so some of the ideas are somewhat incorrect or speculative. Afterwards, I became so embarrassed by it that I had not looked at it until today in May 2022 with the monograph complete, and was astonished to find in my one 44 year old hard copy many ideas that are now fully articulated in the monograph with the advantage of nearly a half century of scientific discovery.

At the time I had not heard of chaos theory. Chaos in the logistic iteration was discovered by Robert May (1976) only two years earlier. Chaos became popularised with the discovery of the Mandelbrot set the same year I wrote (Brooks & Matelski 1980). The edge of chaos, was first articulated a decade later (Packard 1988). I had to depend on ideas of catastrophe theory, creodes, dynamical attractors and the breaking of structural instability. There is but one brief reference to fractal processes, in attempting to define chaos in terms of "generalised catastrophe" (Stewart 1976):

Previously it was thought that a real dynamical process must have a form which is stable to arbitrarily small perturbations, otherwise it would be ephemeral and cease to exist by infinitesimal perturbation. However, it was subsequently discovered that many basic physical phenomena, such as fluid turbulence are intrinsically unstable and cannot be approximated by a stable model. Such processes are called generalised catastrophes and may be regarded as structurally indeterminate. In such processes, the global dynamic may give rise to ramifying local structure through fractal stability breaking.

And an introductory poem in echo of a snow flake growing in the atmosphere ...

*I am a tree whose leaves are trees. You are the endless colours of the night.
I grow into you. You forever dissolve me, in the swirl of your eddies of eddies.*

Fig 254: Left and centre: Microcellular formations generated in my little lab from HCN and NH₃ over H₂O, sometimes with HCHO. Right: Spores of a psilocybe species at the same magnification used for size comparison (King 2020a).

Nevertheless the 1978 paper clearly elucidates the central theme of the cosmological symmetry breaking of the forces of nature, leading to cosmological biogenesis, through the interactive processes of strong and weak chemical bonding, expressed as a "holographic" non-linear process, due to the fractal nature of coherent spatial molecular orbital wave function interactions:

Recently unified field theories have been discovered, which indicate the four forces of nature, gravity, electromagnetism, the nuclear force and the weak radioactive force all differentiated from a common superforce in the big bang at the origin of the universe. This superforce is based on the duality between the bosons, which cause force and the fermions which cause matter. This theory demonstrates that the origin of life is a direct interactive consequence of the differentiation of these forces That it occurs in a substantially unique and general way throughout the universe (p5).

To form a more accurate picture of the non-linear behaviour of molecules, we note that the molecular dynamics of concentrations depends on the holographic energetics of bonding. We need to consider two levels of phenomena, the global dynamics of concentrations and the quantal transformations of the orbitals (p21).

In this, the theory cites prebiotic polymerisations as having formally unpredictable behaviour, leading to complexity, because the more complex products cannot be deterministically predicted from the wave functions of the simpler reactants and their concentrations alone, due to stochastic quantum and auto-catalytic effects:

Normally large numbers of molecules in a reaction are deemed to swamp any incidental quantum events ... suggesting that classical models of chemistry are sufficient. What is not generally appreciated is that the quantum character is not displayed in temporal terms, but spatially in the globally derived wave theoretic holographic bond. This introduces a structural form of uncertainty, where the nature of the products cannot necessarily be deduced from the wave functions of the reactants.

The bulk of the paper is a documentation of the then known prebiotic chemistry and molecular biology laid out as a biogenic evolutionary sequence, however in the last few pages an overview emerges articulating many of the key ideas, spanning biogenesis, evolution and consciousness that have 44 years later emerged in this manuscript.

The link between the eucaryote endosymbiosis and the origin of cell membrane neuro-excitability involved in neurophysiological activity and cellular social communication and cell-virus symbiosis is noted over 40 years before being published by Wan K & Jékely G (2021).

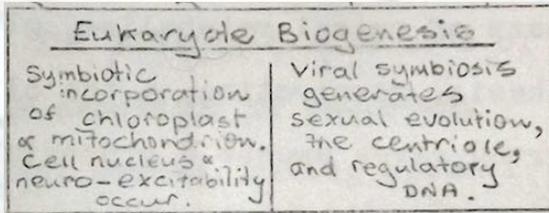

Fig 255: The link between eucaryote endosymbiosis and neuro-excitability noted in King (1978).

The link between understanding conscious brain dynamics and the evolution of the brain from single celled eucaryotes, through organisms like hydra, where there is only a primitive neural net, in Symbiotic Existential Cosmology is clearly articulated:

To understand the global properties of brain function, it is necessary to examine the evolution of the brain from its primal source. The amoeba already has a sensitive sensory-muscular coupling capable of controlling pseudopod movement and even capturing moving prey. It distinguishes active and passive prey, thus being sensitive to external vibration, probably via threshold neural excitability. ... it is also chemosensitive ... it responds similarly to bright light so is photosensitive, like algal flagellates. Such behaviour is complex, involving a degree of choice in of conflict of sense data (p104).

The amoeba-flagellate character of coelenterates is noticeable. The hydra may move slowly by gliding through a creeping amoeboid movement of its base. It may also somersault over on to its tentacles, letting go at the base and swinging over itself into a new position. Those with long arms can also drag themselves to a new site by grabbing a nearby structure. The nervous system of hydra is a net, covering the organism with a slight concentration around the mouth. There are no specific pathways. Impulses can cross synapses in either direction and excitation travels generally across the net. There are sensory cells, but no evidence of specific ganglia or a brain. Thus the behavioural repertoire does not arise from the organisation of the nerve net as such underlining the difficulty of explaining insect, or vertebrate behaviour in terms of neural organisation, which is only secondary to the neuron (p105-7).

Fig 256: Hydra showing complex coordinated behaviour (King 1996). The simple-eyed (fig 154) cnidarian box jellyfish, which is likewise "brainless", although it does have specialised neurons around the eyes (Nielsen et al. 2021, Arendt et al. 2016). Cnidaria are fully-capable of associative learning (Botton-Amiot, et al. 2023, Bielecki et al. 2023).

The idea of conscious brain dynamics occurring at the edge of chaos is clearly expressed a decade before the concept was defined:

We investigate the cortex as a generalised system which has evolved to cope with environmental structural instability in its functioning (p113). ... A computer breaks down whenever it faces a situation of generalised catastrophe that corresponds to a structurally unstable situation. To avoid this problem, the brain must incorporate generalised catastrophe in its function. For this reason, it must also utilise the sub-cellular catastrophe function of the neuron (p117).

The view of consciousness as cosmologically primary is clearly expressed, as well as its link to quantum uncertainty:

This brings us to the door of consciousness. In a deterministic system, here is no room for consciousness. The states of the system are already determined by the initial conditions. Consciousness has no definable meaning in terms of states of the brain, or otherwise.

However, in an indeterminate system consciousness may be dual with respect to uncertainty. Reduction of the wave packet to the particle has proved an irreducible problem in quantum theory. ... This has led some physicists to propose that the consciousness of the observer is involved (p118).

The only world we ever do experience is the conscious one. It is the umbilical cord that connects us to the physical world. If we become deeply unconscious, the world is lost too. Indeed, we never experience the physical world. We do not see the atoms of the

apple, not the photons that reach our eye, not do we see the excitation patterns of our nerve cells. Atoms and photons are colourless odourless structures of energy. They have wavelength but not colour. The physical world is a myth about consciousness. Sights and sounds cannot be reduced to brain states because brain states are colourless, soundless electrical phenomena. The nearest we can come is to associate sound and colour with certain dimensions of uncertainty. ... Consciousness is an immaterial phenomenon, as evidenced by our capacity to dream a full extra-physical reality (p119).

The idea of sense modes being quantum modes, rather than just brain states is presented:

The amoeba has three dimensions of uncertainty. Weak bonding of the trace chemicals from the environment. Perturbations from photon absorption, possibly by such molecules as serotonin (indole has maximum uv absorption and catalyses triple transfer). Finally there are vibratory perturbations caused on the global membrane surface.

The idea of non-IID quantum processes not converging to the classical is enunciated over 40 years before it was reported by Gallego & Dakić (2021):

Random models do not approximate uncertainty. ... Statistics is a model of probabilistic determinacy under repeated conditions. It gives no hint as to the situation when the conditions are transformed by each event (p119).

The central message of biospheric symbiosis, central to Symbiotic Existential Cosmology, is already fully articulated:

Let us now turn our attention to the environment. The instability theorem shows us that no external control of the ecosystem can provide a regime of advantageous stability. The biosphere survives from its catastrophic diversity. It is from this diversity and instability that it moves back from equilibrium, giving us the air we breathe and the food we eat. All attempts to subject the biosphere to manipulative constraint merely reverse the trend and return it to bleak lifeless equilibrium. This is grandly demonstrated in ecocrisis, which stands, a dark cloud over our future.

Although it is the biosphere as a whole, rather than the plants which evolve to climax diversity, the notion of biospheric symbiosis is already expressed:

The test of man is whether he can undo these effects before it is too late. There is considerable evidence that plants are exosymbiotic. Their evolution favours species diversity rather than survival of the fittest.... When we come to consider the atmosphere, we find a similar situation. It is an autocatalytic system just like ourselves (p120).

The research report finishes with an confession that the humble author has fallen right outside the puzzle box of reality in a psychedelic experience and just as now is trying to communicate with those still inside the bubble to alert them to their plight:

All science is a myth. A myth is a description of reality by a culture. Science is a brilliant invention of culture because it was a completely new way of going about myth making. It introduced the notion of scepticism and going out and checking the details to see if they fitted the myth or not. ... It also brought the idea of prediction. A myth should predict that some things would happen and other things not.

All this would be very fine if it were not that science has become such a powerful myth that most people take it for reality itself, especially scientists. Once this happens, the safeguards are gone. Thinking becomes lost in a paradigm of outlook, a dusty plain, broken by the occasional catastrophic perspective that is triggered by some errant genius finding his way out of the puzzle box of reality and being able to communicate with the people inside.

The prime task of the anthropologist is a creative one. To guide his culture into wholeness, by participating in the great myths of our origin. It would not be possible were it not for the brilliant work of thousands of careful experts to whom we are all indebted. This is not my theory. It has no name. It should never have one except perhaps the cosmological theory of biogenesis.

I persuaded the university to let me build a small origins of life lab and succeeded in making primal microcells. The research overview of biogenesis has continued (King 2020a).

Crisis and Resplendence

In 2015, while riding my pushbike at dusk without a helmet, in the interests of being as free as the wind, as one of the wild and feral generation that came before safety belts and cycle helmets, a car suddenly emerged from a driveway and, in jamming on the brakes I flipped over the handlebars and tumbled head-first onto the concrete. The next thing I knew an unspecified time later was that I walked into our house with blood streaming across my face, an eye like a pomegranate and my front teeth knocked out, saying what "happened to me"? "Was I mugged"? When I went out to check the bike I found it twisted and unrideable and the garage doors covered in blood.

Resplendence: A Revolutionary World-view (click the image to view on an internet capable device).
The other face complementing this talk is my resurrection song Revelation.

Hours later, in accident and emergency, cloudy images of my panic as I saw the car and began to tumble reconnected, as I waited in observation. It later transpired from other people's accounts that I had been knocked unconscious, was found staggering around the accident site and the ambulance was called, but by then I had wandered off and dragged myself and the bike across town in a concussed state with no memory of how I made it home. I refused an X-ray although the doctors pleaded with me that I could succumb from a haemorrhage and survived with no permanent sequelae.

As soon as I had recovered, I realised that what I had done was dangerously foolish. Not because of risk to my own life and sanity, but because it could have deprived me of revealing to the world an answer to the conscious existential dilemma of life, the universe and everything, pivotal to saving the diversity of life and our planetary future.

Fig 257: Bloodied, but unbowed

Thus emerged the concept of planetary resplendence (*resplendere* "to shine brightly", transcending religion – *religio* "to bind together") as a cultural paradigm. Resurrection Revelation a hymn to the event.

This project then remained quiescent and unfulfilled for the next six years, until my quantum change experience on sacred mushrooms in early June 2021 gave me a root jolt of realisation that I need to act now, re-galvanising the renewed urgency of this quest. I am in a world where there is a real and significant risk that humanity will cause a hard planetary landing, precipitating a mass extinction of up to half the planet's biodiversity amid a climate crisis that could take us back 50 million years to the early Eocene climatic heating peak shortly after the dinosaur extinction. If I don't speak out and do something decisive while I am alive, the ability to avoid this evolutionary and frankly cosmological calamity, which could prejudice human survival will evaporate.

This is again what the moksha epiphany on sacred mushrooms told me in the most compassionate possible terms. The message is real and glaringly urgent. It is not a religious or spiritual fantasy. It is hard reality speaking a warning that all the science tells us is serious and immanently needs to be addressed. Humanity must act and must act now and a key, however strange it may appear, lies in the biospheric sacraments, which is the purpose of this spore communication.

Biodiversity Affirmations

Communique on Preserving the Diversity of Life on Earth for our Survival as a Species Declared Jan 6 2022 on the Anniversary of Completing our Millennial Vigil to Jerusalem to Reflower the Tree of Life, in Sacred Reunion between Woman and Man

My name is Chris King (b Epiphany 1945).

I came into this world, in a time of planetary crisis to bear witness to an incontestable, urgent and neglected truth:

That for our own survival, we must act decisively, now without procrastination, to save the immortal tree of living diversity on our planet, before the immanent **mass extinction of life** fully ensues at human hands, **severely compromising our immediate prospects and dooming our long-term future as a living species.** From this umbilical truth, the very meaning of conscious existence and all its unfolding depths and wonders spring forth.

My defence of this claim, transcending both the materialistic and theistic world views is set out in **Symbiotic Existential Cosmology** – the veridical cosmology of the universe in which we consciously exist. This is demonstrably the most provocative creative commons work of 2022, because it fulfils our existential quest for the true meaning of existence, by augmenting quantum cosmology with conscious volitional agency, opening up the full dimensions of the subjective realm underpinning all religious traditions. This means that the Cosmology is not just a work of scientific empiricism, but is the veridical Logos of religious paradigm innovation, assigning to me a rightful duty of care to articulate the **Weltanshauung of Immortality**, thus fully transforming the zeitgeist, because, in saving the diversity of life, it fulfils our existential hope, in our relationship with existence once again becoming everlasting, as it has for the last 3.5 billion years.

The Weltanshauung of Immortality is the world view in which life and conscious existence are recognised as perennially immortal processes key to the cosmology of the universe and that the meaning and reason for conscious existence is the sacred process of fulfilment of the flowering of life, so that the universe as a whole can become fully aware of and truly know itself through the living biota it has generated as a climax phenomenon.

Covenant: In the spirit of consilience, I humbly ask all of us worldwide to join with me in this critical venture of planetary redemption, as autonomous human beings, in mutual affirmation:

That we agree:

- to dedicate** a full half of each of planet Earth's land and ocean habitats to the preservation and future evolution of life;
- to sustain** the diversity of life with our lives;
- to turn the tables** on exploitation and expediency;
- to support** the next generation's strike, not just for climate, but for the diversity of life itself;
- to act where necessary** in living rebellion against the genocidal extinction of life at human hands.

On receipt of this communication, we **each inherit a responsibility to act** upon it and to share the discovery process!

Please publish this message widely and forward it to everyone in your domain – because all future lives urgently depend on understanding the need and taking action now!

Most urgently we need small groups of inspired people to diversify the communication process!

The Indictment:

- (1) We are **assimilating the living wilderness habitats of the planet**, and the diversity of life is simply taking **the expedient back burner**.
- (2) The **biomass of humans + livestock is over 22.5 times that of all remaining wild mammals**, creating an **immanently lethal double population crisis**.
- (3) We have **no clear confidence of holding the line on climate crisis**, with COP26 **failing to phase out coal use and 1.5oC on life support**.
- (4) We are still **overflowing with nuclear overkill**. The superpowers are in brinksmanship on the border as I write.
- (5) We are completely losing the **distinction between conscious life and artificial intelligence**, and with it **human conscious volitional agency**.
- (6) We remain addicted to an **unsustainable exponentiating GNP economic paradigm of exploitation** over shorter and shorter triple witching hour instabilities.
- (7) Last but not least, a **clear majority** of people on the planet adhere to **religious views invoking dominion over nature, and directly embracing destructive apocalypse**.

These are **our seven deadly 'sins'** and all are abundantly clear paths to inevitable **Fermi paradox catastrophe**.

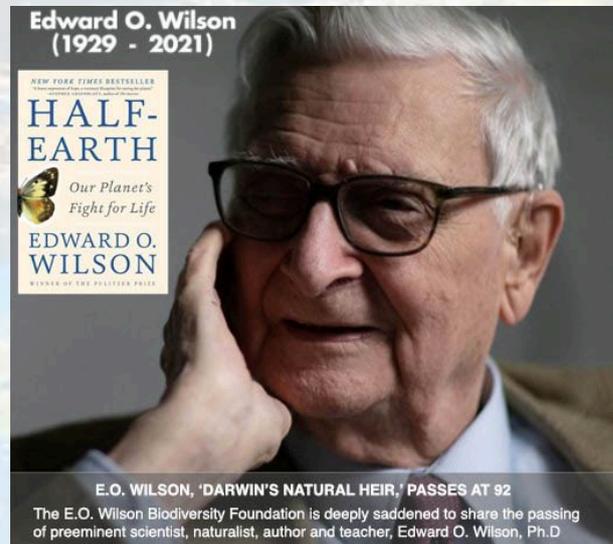

If you pause and reflect on this message, you will realise that everything I am saying here is veridically true, as is the cosmology. I have come in the time of acute need, to light the beacon of life's resplendence and guard it till it shines brightly! No one else on the planet has expressed any real hope of bringing both the religious and materialistic paradigms into full alignment with human and biospheric survival in time to save life as a whole. Someone had to discover their true incarnate calling and make that tortuous journey into the unknown. But I am just the catalyst, bearing a sacramental biospheric ally. With the full unveiling of this knowledge, this gnosis, the baton of conscious agency over the future of the living universe around us now passes to all of us.

The Huichol have said, that we are "*perdido*" – lost, done for. But in this sacred undertaking we shall find our true redemption. Through our collective affirmation, we shall begin at last to truly keep the immortal way of the Tree of Life throughout our generations forever. Through this awakening, humanity can be confident of inheriting perpetual life, as a species, through our true love for one another, just as Genesis envisaged before the Fall.

In this very act, we become liberated. We shall know it in our heart of hearts and can feel it in our bones – this is our one true calling, to have chosen that good part that shall not be taken away from us, in the time of true need, as one people, as a living species and as a symbiotic biosphere: To save the life tree of the living universe in the cusp of our planetary crisis, so that conscious existence can continue to fully flower and unfold in the universe unabated. This is our *raison d'etre*, our true meaning in life, and shall become our ultimate fruition in resplendent Paradise on the cosmic equator in space-time.

What we have within us will save us if we bring it forth from ourselves.

We CAN DO this! What other viable option can there be?

Affirmations: How to Reflower the Diversity of Life for our own Survival

Elucidated in a conversation between Chris King and Suzy McFarland

Ron Horgan: I agree Chris, the long term future of *Homo sapiens* on Earth requires us to live within our means as part of the biosphere. Can you enlarge on the rules and laws we need to live symbiotically with nature? Your 206 page monograph is a very detailed study but confuses me. My strength is rapidly reading and extracting the key points from a wide range of discoveries. What do you recommend we do?

Chris King: The solution is twofold: (A) **The meaning and purpose** and (B) **The action required**. Both are essential because without A, B won't happen in time to do what's really needed.

Both **theistic** and **mechanistic** cosmologies leave us with **annihilation**. The first sacrifices nature to human dominion, then apocalyptic triage and destruction. The second is a lifeless machine, in which conscious life is an informational accident that has no cosmological meaning or significance. **Symbiotic existential cosmology** puts the ghost of consciousness back into the machine of the universe, by minimally augmenting quantum cosmology to include subjective experience. The meaning and purpose is for conscious existence to fully flower to fruition as an immortal process of the universe becoming fully aware.

A: **Symbiotic Existential Cosmology**, in its simplest irrefutable form, comes in three short statements:

- (1) **Biogenic:** Life exists cosmologically as a fractal consequence of the symmetry-breaking of the quantum forces of nature, ensuing from the cosmic origin, eventually reaching interactive climax in biological evolution.
- (2) **Panpsychic:** Subjectively conscious volitional will has efficacy⁹² over the physical universe. *This imbues at least some matter (brains) with physically efficacious subjective consciousness. Thus primitive subjectivity, is a property of normal matter.*
- (3) **Symbiotic:** The planetary biosphere survives and evolves through ecosystemic symbiosis, upon which human survival is dependent. **Biospheric symbiosis** is thus **essential for human survival**.

This is, in its simplest form, the true veridical account of the universe in which we consciously exist.

The **first** is obvious – just look around you! The diversity of life exists physically as a climax phenomenon – a quantum complexity catastrophe. The **second** is subjectively conscious existence being able to affect the physical universe, as we know from every act we take and every decision we make. This implies some matter e.g brains have an occluded subjective complement, but because the brain obeys the core quantum forces, like other matter, its a fundamental aspect of cosmology, invoking panpsychism, animism and the spiritual/religious impulse, although it's counterintuitive that the most obvious solid fact of reality opens the entire spectre. The **third** and **most important** is that the universe rises to consummating complexity through **symbiosis** between life forms, **not dominance**, as in dominion over nature by *Homo sapiens*.

B: **Reflowering Paradise on the Cosmic Equator in Space-time** 13 billion years out from the big bang:

- (1) **Give half Earth back to re-wilding the wilderness**, so there is enough species diversity for the biosphere to evolve.
- (2) **Transition to renewable energy** immediately.
- (3) **Decentralise food supply chains** to protect humanity.
- (4) Ensure the **genetic diversity** of our **food and medicinal** species.
- (5) **Eliminate nukes** and consider how best to avoid a massive **asteroid Earth strike** (Lubin & Cohen 2022) and protect from **nearby supernovae**.
- (6) Teach people how to **live in symbiotic urban culture**.
- (7) **Use technology for the benefit of life as a whole** not for personal gain, humanity alone, or an artificial intelligence takeover.
- (8) **Celebrate the perennial wonder of existence** throughout our generations forever Amen.

Hillel stated the silver rule, claiming he had recited the Torah standing on one foot. This herein is the cosmological silver bullet for the immortal Tree of Life standing on one toe! This is it. This discovery can happen only once. We aren't going to get another. This is who we really are and what the universe is really here for!

Ron: Chris this is superb. "This is who we really are and what the universe is really here for". We sure aren't going to get another chance. How to get this message onto every television and computer screen? You have made my last 10 years. Thank you.

Suzy McFarland: And, what do you expect the rest of us to do?

Chris: I ask you simply to assess two things and make up your own mind up, about this:

- (1) Do you consider that I'm telling you the veridical truth here, as a subjectively conscious human being?
- (2) Do you affirm that you also have subjective conscious volition over the physical universe?

Suzy: (1) Yes, I believe you are telling me the veridical truth. (2) Yes, I do believe this.

Jane King: Yes indeed. I do. Yes to all!!

Ultimately everything that ensues in Symbiotic Existential Cosmology to reflower and reparadise the Earth flows from this mutual veridical affirmation and the preparedness of people to communicate it to others in this way.

⁹² *efficacy* – the ability to produce a desired or intended result.

Entheogenic Conclusion

The key to this article is not just that psychedelics can induce a type of conscious awareness of the “mind at large”, but that they have a potentially pivotal role in alleviating the climate, habitat and natural resource crises that are precipitating a human-induced mass extinction of biodiversity, through the symbiotic relationship with nature these experiences invoke in the shamanic context where human relationships with nature and its spirit world are paramount.

Traditional religions, sourced in patriarchal moral imperatives and an hierarchical top down business structure to enhance social dominion, based on a scorched-Earth desert philosophy, in which natural life is just a prelude to a Day of Judgment to be consigned to eternal Heaven or the fires of Hell, are tragically ill-positioned to be able to address this existential crisis of humanity and the planet. What is required is a paradigm of autonomous direct personal responsibility to care for the universe and the sentient life within it in immortal perpetuity over cosmological time scales. This is the epoch of living Paradise all spiritual paths hunger for.

“So what we’re seeing now is a rejection of religion across the world as a hierarchical business model to connect to spirit and they’re going straight for spirit” – Rak Razam (Stewart 2013).

The question is not transcendence in its own right, which is superlative, but the responsibility this imbues to cherish and protect the living universe. This is not just a moral responsibility, but an active intent that arises from purposeful symbiosis with the cosmic mind.

This is the overwhelming message the psychedelics have communicated to me through countless sessions over 55 years and particularly through the natural entheogens and the symbiotic relationship they invoke. It is not something that proceeds automatically out of the psychedelic experience, which, like love, is a many-splendoured and sometimes very challenging thing, but nevertheless its biodiverse aspect is widely shared, in the sense of connection with nature reported in the psychedelic studies and manifest in the shamanic tradition of entheogenic use, where spiritual realisation is accompanied by a sense of integration with nature and interdependence within it. The threat to biodiversity of a mass extinction lasts over evolutionary time scales, so while climate might be addressed and mitigated due to human pressures, the unrelenting pressure on biodiversity could become exacerbated. Hence entheogens come to provide a critical short and long-term remedy to dominion over nature by increasing awareness of our symbiotic relationship with life as a whole.

The reason I have concentrated on natural psychedelics is fivefold:

- (1) Entheogenic species are an integral part of the planetary evolutionary endowment of biodiversity, as are our food and medicinal species.
- (2) Natural psychedelics are potentially symbiotic cohabitants with *Homo sapiens*, which already exist in a symbiotic relationship with the cultures and movements utilising them entheogenically.
- (3) Natural psychedelics have been used for millennia and are proven to be both safe for the individual and safe for society when used in a guided and protected spiritual, or therapeutic context.
- (4) The entheogenic experience of natural psychedelics is powerful and capable of evoking a full psychedelic state, so that, although synthetics present additional features, natural psychedelics are “sufficient unto the day”.
- (5) As long as psychedelics remain illegal, natural psychedelics are verified by their genomes to be pure of synthesis contaminants and are easily cultivated, enabling autonomous use without contact with the illegal drugs market.
- (6) They are not addictive because the effects wane rapidly on repeated use, requiring a refractory period.

There are also a variety of other natural and synthetic agents which can also have profound consciousness-altering effects, including cannabis species (THC), *Salvia divinorum* (salvinorin-a) and the synthetic drug ketamine, each of which have properties distinct from and potentially complementary to those of psychedelic entheogens. Some may also induce forms of Bardo Thodol experience, but classic psychedelics take the centre stage (King 2021b).

Sacred mushrooms contain other related psychoactive molecules, fig 258, which also contribute to the overall effect. *Psilocybe cubensis* caps have been found to have 0.01% by wt of aeruginascin, 0.07% of baeocystin, 0.88% of psilocybin, 0.01 % of norbaeocystin, 0.06% of psilocin, with stypes having about half these levels (Gotvaldová et al. 2021). Previously the rare *Inocybe aeruginascens* was found to have high levels of aeruginascin – dry weight 0.35% aureginascin, 0.52% psilocybin, 0.36% baeocystin. Gartz compared reports from 24 cases people who accidentally ingested *I. aeruginascens* to those who accidentally consumed *psilocybe* species with high levels of psilocybin and

psilocin. Those ingesting the inocybe reported only euphoric experiences, while the others had an “often slight and in some cases deep dysphoric mood”. A typical dry weight dose of cubensis is 0.3 g (micro), 1 g (mild) 1.75 g (medium), 3.5 g (strong) g medium and 5+ g (heroic T McKenna), corresponding to ~40mg psilocin. Therapeutic doses range from 20-30 mg psilocybin. There is no evidence body weight is a significant factor (Garcia-Romeu et al. 2021).

Inocybe aeruginascens

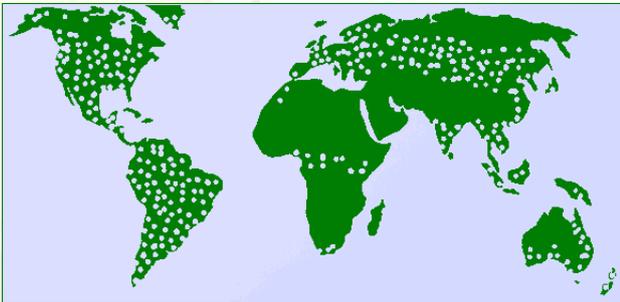

I have focussed my case on sacred mushrooms because peyote and ayahuasca are hard roads, due to nausea, while mushrooms are capable of being perfectly potent, have no such effects, particularly if ground dried in a mortar and pestle, soaked for 20 min in lemon juice to convert the psilocybin to active psilocin and drunk as a tea, resulting in a shorter, but intense experience that is easily contained in a busy life without fatigue or derangement. They are readily cultivated symbiotically (Stamets & Chilton 1984) and exist worldwide (Stamets 1996).

As Terrence and Denis McKenna stated to the reader in their mushroom growers guide (Oss & Oeric 1976):

“You as an individual and Homo sapiens as a species are on the brink of a symbiotic relationship that will eventually carry humanity and Earth into the galactic mainstream of higher civilizations”. ... “Flickering before us is a dimension so huge that its outlines can barely be brought into focus in the human frame of reference. Our animal existence, our planetary existence is ending. In geological time that ending is now only moments away. A great dying, a great extinction of many species has been occurring since at least the partnership society in prehistoric Africa. Our future lies in the mind; our weary planet's only hope of survival is that we find ourselves in the mind and make a friend that can reunite us with the earth, while carrying us to the stars. Change more radical by magnitudes than anything that has gone before, looms immediately ahead. Shamans have kept the gnosis of the accessibility of the Other for millennia. Now it is global knowledge. The consequences of this situation have only begun to unfold” (McKenna 1992 263).

Growing Wild Mushrooms

Psilocybe mushrooms have been found in all five continents. They have even been observed even in seven citations in [Antarctica](#). As noted previously, the active principles appear to originate from [horizontal transfer of a transposable element](#) between mushroom species and span more than one genus and both wood decomposing and pastoral habitats associated with Brahman cattle.

Fig 257a: World psilocybe distribution (Stamets 1996)

Although psilocin is a schedule 1 banned substance, natural psychedelics are being decriminalised in many locations. Oregon has made "magic mushrooms" legal for mental health treatment in supervised settings. The District of Columbia has passed the Entheogenic Plant and Fungus Policy Act of 2020, allowing for the possession and non-for-profit gifting or distribution of natural psychedelics. The Canadian province of Alberta has announced it will allow the use of natural psychedelics for medicinal purposes in drug-assisted psychotherapy. Australia has approved psilocybin and MDMA in prescription medications for the treatment of PTSD and treatment resistant depression. Until 2008, they were fully legal in the Netherlands. In 2023 One in 100 people in England and Wales took hallucinogenic drugs in the last year as “magic mushroom” use increased, due to increasing “studied” use by older adults. About 260,000 people aged between 16 and 59 have taken magic mushrooms in the year to Dec 2023, 100,000 more than in 2020.

The approach, roughly following Stamets and Chilton (1983), Harris (1978) and previously Oss & Oeric (1976) is for one of the most commonly cultivated tropical species *Psilocybe cubensis*, whose spores are widely available and do not contain psilocin, so are generally not illegal, but the same principles apply also to the wood decomposing species. This is the outlay to work securely from spores to fruiting fungi, as a stand alone kitchen pastime, but in many places there are online mushroom kits available which are also generally not illegal. This makes it possible for mature people to privately have deep psychedelic experiences without any connection with trade in illegal substances.

(1) Collecting and preserving spores. Collect a fresh fruiting cap showing signs of dropping spores on its gills and place it on matchsticks or a kebab sticks on a clean sheet of paper with on a piece of waxed paper or aluminium foil, covered by a protective bowl that allows air movement under the edge but out of drafts. After sufficient spores have formed a radiating print not too dense, remove the mushroom cap and leave the spore print to dry out. It can then be placed rolled up or hanging in a small clean sealed jar that has a small container of dried lithium chloride LiCl in a pill canister with vent holes to keep the humidity at 5% and store it in a fridge at 4°C. Spores can remain fertile for years this way.

(2) Propagating Media:

(a₁) **Malt Extract Agar:** 175ml water, 3.3 g agar, 0.1 g CaCO₃, 0.1 g K₂HPO₄

(a₂) **Potato Dextrose Yeast Agar:** 175ml soup of one small potato grated and boiled for 20 min, 3.3 g agar, 0.1 g CaCO₃, 0.1 g K₂HPO₄, pinch of flaky yeast, 1.5 g dextrose.

(b) **Rye Grain Mix:** 300 ml water, 224 g whole rye, 1/2 teaspoon of lime, 1/2 teaspoon of blood & bone (to provide phosphorus). A piece of decomposed cattle manure can also be added if the mix is to be grown on composted hay.

(3) Equipment.

(a) Laminar Flow Transfer Chamber. The initial stages of fungal propagation need to be performed in a sterile environment. The ideal way to do this is to build a small laminar flow chamber containing a low pressure high flow pump used in air conditioning combined with a large HEPA filter which keeps out particles larger than 0.3 μm with a steady flow into a chamber with a perspex top and front opening, as shown in the figure. One could use the outflow of a room air conditioner with an 0.3 μm filter to do this.

(b) Incubators. One needs a small incubator cupboard with a thermostat to culture spawn at 24-28 °C connected to an incandescent bulb warmer of suitable wattage. One also needs one or two mushroom growing incubators with a transparent lid to let in enough light to stimulate fruiting and a small floor vent to release CO₂.

(c) Propagating jars with filters. Buy small and large (250 ml and 120 ml) pots with sealing aluminium lids, that can have 50 ml 0.22 μm nylon filters inserted into the lids e.g. with epoxy, to be used for striking spores and transferring spawn. The larger pots can be used to break up the agar and transfer to large 1 litre cylindrical wide mouthed **KILNER** preserving jars with separate screw caps and seals which can easily tip out the spawned grain after it as grown. One needs to make a second seal of aluminium sheet which has a portal scored into it to glue a 50 ml 0.22 μm nylon filter onto it as well. Large 35 cm x 30 cm sealing plastic bags. Standard PM 2.5 face mask filters which can be taped over a portal in the bags to allow the spawn to breathe.

(d) Instruments. A small scalpel and scissors and a hooked stick that can be sterilised, and a simple meths burner to re-sterilise the transfer stick during operations to avoid cross contamination. Clean latex gloves. Disinfectant spray.

(e) A good pressure cooker that doesn't leak steam and preferably has a pressure gauge such as an **All American** 921

that is tall enough to accept two Kilner jars (of height 210 mm). Put the Kilner jar in with the filter seal above the inverted original seal to allow the grain to be shaken without hitting the filter. Put all the agar jars and sterile instruments in as well. Cook for 35 mins at 10 psi (0.7 kg/ch2). Let the cooker fully cool before transfer.

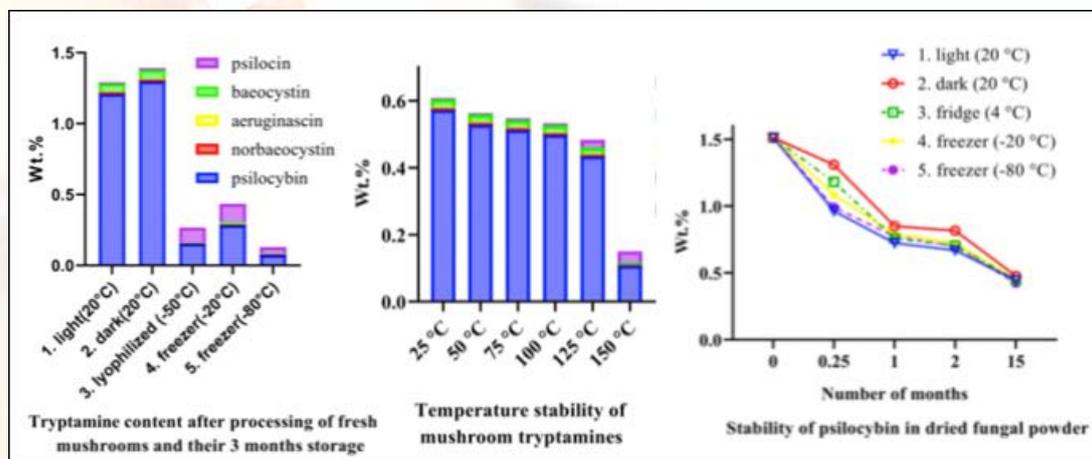

Fig 257b: Steps in the process. (1) Jar with hanging spore prints and LiCl to keep moisture below 5%. (2) 250 ml pot with filter lid with spawn. (3) Transfer chamber with large concertina folded high flow 0.3 μm HEPA filter in the back wall, a 120 ml pot ready to transfer and a Kilner jar with larger filter in the lid with grain, and a meths burner left. (4) Plastic bag with face mask filter and mature grain spawn. (5) Fruiting mushrooms.

(4) Sterile Transfer.

- (a) **Preparation:** Open the front of the flow chamber with the fan on in a still room and sterilise the interior with a cloth with disinfectant and leave it to flow for a short period to clear. Keep the fan on during the entire process.
- (b) **Spores to agar.** Hold a spore print in one gloved hand. Take the sterilised hook and flame it over the meths burner and insert it into a jar opened in the flow chamber to moisten it and stroke it on the spore print and then streak the surface of the agar, leaving a light spore streak and close the jar. Do this with several jars to ensure success.
- (c) **Agar to agar.** Replicate the above, by cutting out a small patch of fungus and transferring to new pots, to ensure a single diploid strain.
- (d) **Agar to grain.** Take a Kilner jar, knock and shake it gently to free up the grain and open it. Tip it on its side. Take a 120 ml jar of agar and open on its side and use the spoon handle to break up the agar into a slurry of small pieces and tip them into the Kilner jar either slanting or upright. Remove the inverted seal and screw down the filter seal avoiding contaminating the filter. Cover the jar with an open plastic bag, take it out and place it slanting in an incubator to grow.

(5) **Fruiting.** When the spawn has run and is clean and white without contamination, knock the jar gently with your wrist to dislodge the spawn from sticking on the walls. Put the plastic bag with the filter over the slanting down mouth of the jar and it should slide into the plastic bag. Now attach a litre jar of vermiculite that has been moistened to fully expand with boiling water and sterilised in the pressure cooker into the bag with the bag held tight and lie it down and seal the bag. Then gently break up the grain into small pieces and mix with the vermiculite. Return the bag to a fruiting incubator at just below 27°C and leave for the spawn to permeate the mix. When it has, cut the bag open in the fruiting incubator and add more sterilised vermiculite to cover so the spawn has a surface to make mushroom pinheads. Make sure the incubator (a styrofoam box with a clear plastic top and a light above 12/24hr). Reduce the temperature to ~24°C. Spray/mist it with sterile water 3 times daily to maintain ambient dampness. You need to have a vent in the floor of the box to let out the heavier CO₂. Wait for the results! Alternatively you can skip the vermiculite and spawn the grain onto compost made from fully moistened hay mixed with fresh cowpats and incubated until composted at around 60°C for two weeks or so, but this requires larger containers. You can do the same with wood decomposing mushrooms using wood shavings, such as alder, or aspen, which can be grown in a temperate mulched garden. Wood decomposing species grow in association with specific woody species so they require focused care.

(6) Drying and Storage

Fresh mushrooms can be eaten, but need to be dried for long-term storage. One can carefully split the stipes (stems) and break the caps into four using minimal crushing, as the blue staining degrades the active content. They can be dried over a warm blower heater, either at room temperature, or at a temperature no higher than 100°C, which preserves 90% of the strength (Gotvaldová et al. 2021). They need to be stored very dry in the dark at room temperature ~20°C in a sealed jar, as contact with air will destroy the active ingredients over months.

Alkaloid extraction of DMT Many plants contain DMT which is also the essential ingredient in ayahuasca, which contains DMT-bearing *Psychotria viridis* and *Banisteriopsis caapi* containing harmine. Ayahuasca can be consumed as a brew because harmine is a mild monoamine-oxidase inhibitor, which prevents the stomach destroying the DMT, but otherwise an alkaloid extraction is needed to get purer DMT which can be smoked or insufflated, as in the Amazonian snuffs like Epena and Yopo:

1. Using vinegar and water, acidify the solution to a pH of ~4 and add shredded leaves, bark or roots containing DMT. Boil for at least 90 mins and then reduce to a smaller volume by continued open boiling. The vinegar then reacts with the DMT in the plant material to create DMT acetate. Converting DMT into a salt form allows for easier absorption by the polar solution. You can do two or three such washes with the same plant material and new solvent and accumulate.
2. Use NaOH take the solution to a pH of 13 and extract with a non polar solvent such as naphtha e.g. hexane. The basic solution reacts with DMT acetate through de-protonation to produce the pure basic form of DMT (freebase), which is virtually insoluble in this alkali aqueous phase.
3. When naphtha is added and shaken, the freebase DMT transfers into this non-polar solution layer. This will require centrifuging or allowing to settle until the aqueous and non-polar phases separate. Carefully extract the non-polar solution using a basting syringe without contaminating with the aqueous muddy layer. Take care the non-polar solvents are highly flammable.
4. When kept in a freezer at temperatures near or at the solution's freezing point, crystalline DMT will precipitate out of the naphtha solution via crystallisation.

A Moksha Epiphany

My entire life has been shaped by psychedelic experience. When I first took LSD in the heady times of 1968, I immediately realised that the universe was the generator of sentient life as a climax manifestation. This became a life long quest, as a biocosmologist, to establish how and why life exists in the universe. I realised that traditional religions defining life as a preparation for Judgment in Heaven or Hell were corrupt cosmologies in conflict with nature, and while Eastern paths invoked meditative approaches to enlightenment, the fact that, by the traditions' own admission this could take lifetimes in rounds of reincarnation, also appeared to contradict realisable illumination.

But the reductionist scientific view also lacked any basis for conscious existence, as expressed by Bertrand Russel who has himself espoused Russelian monism – a form of panpsychism:

"Such in outline, but even more purposeless, more devoid of meaning is the world which science presents for our belief. Amid such a world, if anywhere, our ideals henceforward must find a home. That man is the product of causes that had no prevision of the end they were achieving; that his origin, his growth, his hopes and fears, his loves and his beliefs, are but the outcome of accidental collocations of atoms; that no fire, no heroism, no intensity of thought and feeling, can preserve an individual life beyond the grave, that all the labours of the ages, all the devotion, all the inspirations, all the noon-day brightness of human genius, are destined to extinction in the vast death of the solar system, and that the whole temple of man's achievement must inevitably be buried beneath the debris of a universe in ruins - all these things, if not quite beyond dispute, are yet so nearly certain, that no philosophy that rejects them can hope to stand. Only within the scaffolding of these truths, only on the firm foundation of unyielding despair, can the soul's habitation henceforth be safely built. ... Brief and powerless is man's life, on him and all his race the slow, sure doom falls pitiless and dark ..." (Bertrand Russell)

Francis Crick in "The Astonishing Hypothesis" put it this way:

"The astonishing hypothesis is that 'You', your joys and your sorrows, your memories and your ambitions, your sense of personal identity and free will, are in fact no more than the behaviour of a vast assembly of nerve cells and their associated molecules. As Lewis Carroll's Alice might have phrased it: 'You're nothing but a pack of neurons!'"

This is reinforced by Sam Harris (2012) in a radio discussion in which he puts the case against free-will:

"You feel like you are a thinker of thoughts - the author of intentions - you feel like you are a subject and commensurate with that feeling is the sense that you are in a position to do what it is you do, to decide to lift my left or right hand and deliberate between the two and I can have reasons for one or the other and I'm in the driver's seat - I really am - and that's where everyone is starting. The problem with that is that objectively we know that everything you are consciously aware of - all your thoughts and your intentions and your impulses and your intentions to resist those impulses - whatever's coming up for you - but we know that's all preceded by events in your nervous system of which you're not aware and which you didn't create and the state of your brain in this moment in every sense is the product of variables that you are not responsible for - you didn't pick your parents, you didn't pick your genes, you didn't pick the environment in which your genome was going to be expressed, you didn't pick the way your interaction with other people and the world sculpted the microstructure of your brain so as to give you the brain you have - you didn't pick the number of receptors you have of every type at each synapse, you didn't pick all the charges that are currently in place in your brain at this moment - you haven't created your neuronal physiology and yet your neuronal physiology is going to give rise to every next thought and intention that shows up for you".

What makes this invalid is that, as we have seen, the uncertainty of the quantum universe renders the classical notion of Laplacian determinism defunct, and it is precisely the loop hole of quantum uncertainty and entanglement coupled with edge of chaos self organised criticality that makes the subjective experience of volitional will possible in the physical universe.

Towards the end of my first academic sabbatical, having also experienced being a sadhu in India and Tibetan Buddhist initiations, I took peyote with the Native American Church and also sacred mushrooms. Much later I made two trips to the Peruvian Amazon to take ayahuasca. During this entire time, my entheogenic experiences were telling me that I needed to act on this knowledge received to protect the planet from a human-induced mass extinction of life.

As a child I had had a dream that I was standing in a parched jungle and all the animals were looking at me with heavy sorrow and disapproving recognition that I was a human that had reduced the earthly paradise to a scorched semi-desert. I had to run from this disapproval and found myself beside an endless queue of people waiting to find work in a dark factory surrounded by smoking chimneys. The dream left a permanent impression on me, long before the climate crisis became recognised. I have also had other formative precognitive dreams evidentially verified before the event.

In the late seventies and eighties held mushroom veladas in the moonlight on our wilderness land. 'Elohim: Living on the Open Road' gives a good expression of the psychic mood. During a mushroom velada in the 1980s, I had an epiphany that if the world hadn't successfully resolved the world's climate and biodiversity crises by the millennium in 2000, I would make a journey to the Amazon and Jerusalem to make a spiritual vigil to Earth's natural Eden of tooth and claw and to Jerusalem as the religious nexus point, to pronounce the reunion of woman and man under the banner of the immortal evolutionary tree of life, as a paradigm shift to restoring perennial sustainability of the biosphere. This is discussed in section 12 of the next article.

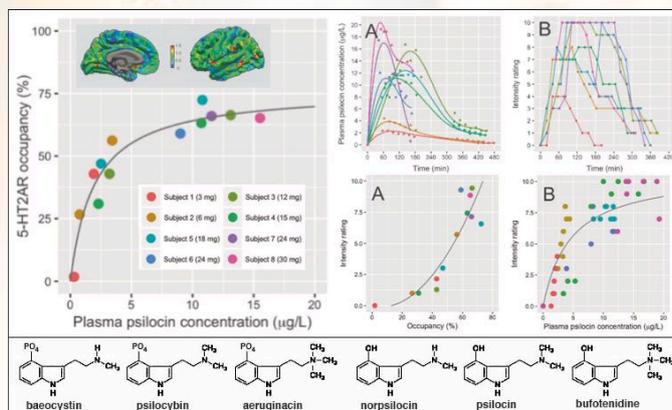

Having travelled widely and risked my life many times in far-flung corners of the Earth, I am now in my late seventies. I hadn't partaken of the sacraments for seven years, because of the fact that acute closed angle glaucoma was liable to make me go blind overnight, due to psychedelics causing my pupils to dilate. Finally, having had the lenses of both eyes replaced with cataract surgery, I resigned myself to break the fast of the mushroom sacrament to return to the source of my life-long inspiration, before I left it so late that I might end up in a terminal condition before circumstances forced me into a last desperate encounter. I took only 1.5 g dried weight, prepared as in the previous section, with some cannabis butter beforehand, to test a level that an elderly person who had not had the experience before could sustain without undue discomfort, given some caring support.

This is consistent with research fig 258, which shows a non-linear saturation curve of the 5HT2a receptor with increasing plasma psilocin levels, consistent with a moderate dose of psilocin being able to induce significant effects, with little of the collateral fallout I have sometimes experienced on an heroic dose.

The resulting quantum change experience is detailed in fig 259, from what I wrote down on my descent the same evening, reawakening my sense of life direction, creative insight and transformative urgency, just as my life has been spent on an unending expedition into the unknown, sailing down a great fjord, with the tacking and gybing, often taken at veladas, to re-envision the pointers on my journey of incarnation.

Fig 258: Dose-response curve for 5HT2a occupancy vs psilocin plasma concentration (Madsen et al. 2019). Psilocybin intake resulted in dose-related 5-HT2AR occupancies up to 72%. Plasma psilocin levels and 5-HT2AR occupancy conformed to a single-site binding model established by positron emission tomography (PET). Minor ingredients in *Ps. cubensis*.

It has many of the key peak hallmarks often described in near death experiences, except here with more emphasis on the letting-go of ego-death and meditative sensory withdrawal, as noted by neuroscientist Chris Koch (2020):

"Similar mystical experiences [to NDEs] are commonly reported when ingesting psychoactive substances from a class of hallucinogens linked to the neurotransmitter serotonin, including psilocybin (the active ingredient in magic mushrooms), LSD, DMT (aka the Spirit Molecule), and 5-MeO-DMT (aka the God Molecule), consumed as part of religious, spiritual or recreational practices".

Rather than representing an hallucinatory drug-induced delusion, such states represent conscious experience taken closer to the edge of brain dynamic chaos than normally occurs in the more controlled meditative and contemplative

traditions of religious spirituality and mysticism. By contrast with the mind-sky visions of the meditative traditions, deep entheogenic experience brings out a more symbiotic cosmic consciousness integrated with life as a whole rather than simply seeking divine grace. This is critical for human survival because the failure to incorporate the sacred transcendence and immanence of nature severely limits the capacity of the traditions to protect human survival and the diversity of life itself. Likewise, by comparison with life-transforming NDEs, the entheogenic brain is in an augmented, rather than diminished function and condition, facilitating a vast and sometimes overloading experience of ultimate reality in fully fledged form, as noted in Griffiths et al. (2019) in psychedelic studies.

For me, this took the form of an NDE that I was meeting Brahman the I was also HE and that because he was immortal or eternal He was ever-so-gently telepathically making me aware that, because I was a mortal being incarnate right in the centre of the existential crisis of life, in physical form, that I had the duty and responsibility to ensure saving the diversity of life on planet Earth, before I passed away.

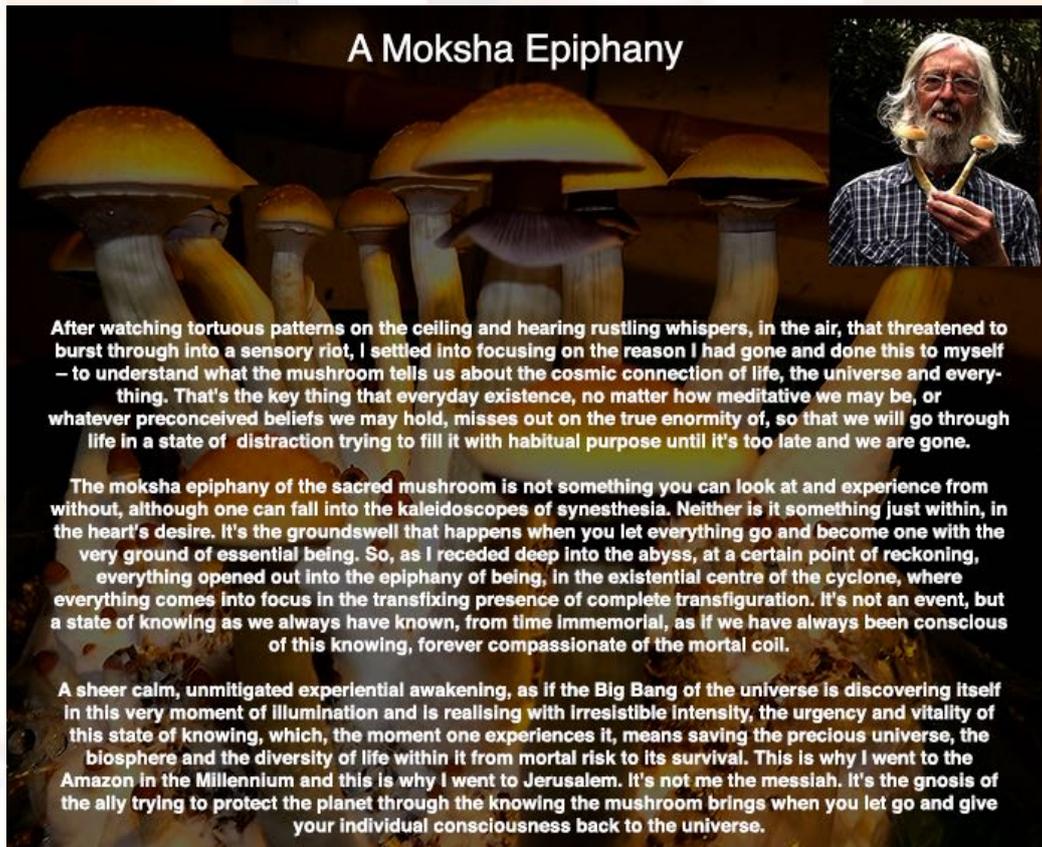

Fig 259: "A moksha epiphany". Written during the evening, after the experience had receded. *"I am not your master. Because you have drunk, you have become intoxicated from the bubbling spring which I have measured out."* (Gospel of Thomas 13).

Dissolving the distinction between self and other is pivotal to this process. The internal model of reality supported by the conscious mind has an envelope of characteristics, ranging from our sensory experiences of the external world, to internal somatosensory, emotional and other representations of self and our ongoing thought processes. Thus subjective consciousness in the ego state is dynamically polarised between representations of subjective self and objective world. When these distinctions are released, the distinction between individual and universal consciousness can also become dissolved, leading to transcendence. Entheogens provide a visionary realisation of this deeper, primary consciousness, giving it experiential reality, by opening the doors of perception to the mind at large.

What is truly extraordinary about this process is that releasing the ego state, even transiently over several hours, can result in long-term integrative changes in the psyche, consistent with adaptive long-term neural potentiation, showing that the underlying processes of universal consciousness are not extinguished, but merely suppressed by the evolutionary shaping of the ego, thus attesting to the reality of the entire phenomenon.

Three weeks after this quantum change experience, having feverishly worked day and night to achieve it, in completing the first full draft of this article, and the co-conceived complementary one [Natty Dread and Planetary Resplendence](#) on

transforming the Christian apocalyptic tradition based on the dying Saviour, into the immortal paradigm of the evolutionary Tree of Life of the living planet.

Two months after the event, with this monograph approaching full shape, I repeated the undertaking, with 1.75 g, again converted to psilocin under lemon juice as a tea, 40 mins after home made cannabis butter, to allow the latter to absorb in advance in the small bowel as an oily substance. Then another two months later I took 1.92 g, reaching a full-on intense psychedelic peak. These were more enveloping as labyrinthine visionary voyages, skirting the edges of the iconic centre-of-the-cyclone transcendence of the first one but presenting other features of the extended conscious state, as is always the case with the diversity of psychedelic experiences.

What they have demonstrated to me as a breakthrough is the ability of the psilocin acid-treatment method to produce a pure, clean visionary source consciousness unparalleled in everyday experience, dream states and any form of controlled meditation, without which humanity's understanding of the full dimensions of the psyche would be weak, pitiful and presumptuous. Taken in the late afternoon, these more powerful experiences, that had me reeling at the peak, were sharper and shorter than ingesting mushrooms predominantly containing the pro-drug psilocybin. The tea is pure dissolved entheogen and induces in the body a pure clean state, in which food is sumptuous and the inner quality of experience is abundantly overflowing for the astute participant to enter and explore the depths of immanent and transcendent consciousness. By midnight these left me able to sleep easily and wake fully refreshed, invigorated and whole, at the age of 76, confirming their fertile symbiotic relationship with my essential being, in the long, tortuous journey of incarnate existence. I have, in opening this confessional account and completing this cosmological description, traversed the long journey that began with the shock of my first experiences with LSD in London in 1968.

Since then other events have intervened, adding further complexions to the situation. I joined two expert groups on consciousness research which profoundly expanded the cosmology into a full cultural-evolutionary account of how human culture got ourselves into existential crisis, giving the cosmology overarching scope and veracity.

Eleven days ago, in July 2022, I contracted Omicron BA5 and rapidly went down hill and had to get an emergency exemption to get Paxlovid, the new Pfizer anti-viral. I nearly succumbed the next night but it stopped the severest phase in its tracks. That made me realise that this happening was a karmic warning I needed to recognise. Although I had written a definitive existential cosmology this has not achieved the covenant of saving the Tree of Life from human destruction, so the following insights summarise my current reflections, beginning again at the original mushroom experience and leading to the journey of living redemption.

Epiphany 1

There are two and only two routes to realisation:

(1) the scientific quest of verified empirical observation of nature and the quantum universe, including traditional neuroscience reframed so that it is not a physically closed classical causal description, but a contextual boundary filter guiding conscious experience as a cosmological complement to the natural universe reflecting all the subtleties of the qualia of visionary experience under the organismic filter applied by neurodynamics on the doors of perception.

(2) the subjective quest of discovering consciousness from within, through mutual empirical experience. The core of this is to **make the mystical vision quest ourselves with no prior assumptions** as the karmic trip of our lifetime because we are already complete conscious sentient beings who have the power to do so, but fail to understand the "Kingdom that lies before us, but men do not see it". That kingdom is our own conscious existence and we can't understand it by analysing it, but only by living it, by descending deeply into it, by **every** means and by actively achieving the redemption of the living planet and the conscious universe.

If we don't do this now we are literally doomed to a rapid, or slow burn Fermi self-extinction. Those that have ears choose to hear not! Time is too short. Things are not heading the right way. We all need to be pragmatic!

Little or none of this involves the kind of rational, philosophical and consciousness research speculation the expert groups I joined are feverishly debating, conflating pseudoscientific ideas of fields, encodings, reverberations, potentials, solitons or even the Ads-Cft correspondence, all of which are just conceptual physical analogies trying to pose as descriptions of consciousness, when neuroscience is already providing a clear objective description.

Decomposing and describing consciousness is not the name of the game. Experiencing reality to its foundational depths is. You don't discover meaning by analysing and describing it, but by taking personal responsibility for the fate of the living universe and redeeming it. Just learn to make the vision quest and save the universe before you die. You can culture mushrooms in a chilly bin. The key is understanding a root shift in the zeitgeist can become effortless, however unlikely it may seem, if it is true to life itself, not just human utopian folly.

"And it was the Evening of the First Day"

To understand this revelation of true redemption we have to briefly return to how it first began. This all started 13 months ago as yet another stroke of karma. I had become unable to safely take mushrooms for seven years because acute closed angle glaucoma risked instant blindness if my pupils dilated. But once I had complete lens replacements, the die was cast. I decided to take the delicate plunge. It was only a tiny morsel, 1.5 gm dry weight, something even an eighty year old spinster needn't turn an anxious hair to, just to test the visionary waters again.

If any of you want to have any insight into what the fully developed nature of pure experiential qualia are, mushroom kaleidoscopes and their deeper visions are the synesthetic sang raal. They are at once all the colours of visual insight and the sounds of immortal waves whispering and rushing and as they gather, rising to screeching intensity through ones being, in undulating resonance, and all the scents and tastes and thrills of the world too and all those things that have been and will be.

Western tradition leans to God as the external Creator, while Eastern tradition sees the Supreme Being internally as pure consciousness. When you look up I-AM, it arises in two complementary places - the Hebrew Bible Ayer Asher Ayer – אני זה שאני – I AM THAT I AM and the Upanishads I AM THAT – Tat Tvam Asi – तत् त्वम् असि or THOU ART THAT. The formative scope of this is extraordinary and potentially universal. This made me realise that the founding experience defining Monotheism was a visionary experience of a burning bush almost identical to my moksha epiphany, and both were essentially an NDE-like experience of meeting with a manifestation of Brahman-Īshvara as per the Brihadaranyaka, the Upanishad of the Great Forest. This places the entheogenic moksha epiphany and its symbiotic cosmology in the mainstream of formative religious paradigm shifts.

Krishnananda notes: In the Brihadaranyaka Upanishad we are told that Brahman – the Supreme Being is Pure Consciousness, in which subjects and objects merge together in a state of Universality. The Supreme Being knew Himself as 'I-Am', inclusive of everything. He became an 'other' to Himself in the act of the manifestation of the Universe. Even in the Biblical parlance we have the description of God as 'I-am- That-I-am'. One cannot say anything else about God. But, the Supreme was 'as if' an 'other', but not truly, for He, nevertheless remained as the Absolute, Self-Conscious Being, and He knew Himself as 'I-am'. 'I-Am' is the highest description of God, but the Absolute is supposed to be transcendent even to this condition of 'I-amness' of the Universal Nature, because the state of 'I-am' is Self-consciousness, though it is Universal. So, in Vedānta, a distinction is drawn between this Universal 'I-am' and the Absolute as it is – the distinction between Nirguna Brahman ultimate reality and Saguna Brahman Īshvara/Ishvari⁹³ the godhead, manifested in Vishnu and the conjugal 'Elohim Shiva-Shakti.

So it was that I lay down in the deepening twilight as the effects began to come on. I saw my son look curiously in and to avoid him distracting me I turned away, and noticed the little streaks of light in the corner of my eye which mean that at any moment I could fold over into the dream world of the nierika. I reminded myself – you're not here just to indulge yourself but to discover the meaning of life, the universe and everything, so I summoned up empty mindfulness and gave my self back to the universe in *fana* or self-annihilation.

⁹³ Ishvara, (Sanskrit: "Lord") in Hinduism, God understood as a person, in contrast to the impersonal transcendent brahman. The root of the word Ishvara comes from īś- (, Ish) meaning "capable of" and "owner, ruler, chief of". The second part of the word Ishvara is vara which means depending on context, "best, excellent, beautiful", "choice, wish, blessing, boon, gift", and "suitor, lover, one who solicits a girl in marriage". The composite word, Ishvara literally means "owner of best, beautiful", "ruler of choices, blessings, boons", or "chief of suitor, lover". In Mahayana Buddhism it is used as part of the compound "Avalokiteśvara" ("lord who hears the cries of the world") – a bodhisattva revered for his compassion. When referring to divine as female, particularly in Shaktism, the feminine Īśvarī is sometimes used. Particular communities within the Hindu fold differ in their understanding of the relation between Ishvara and brahman. Theistic communities maintain that the two are one and the same or even that the personal representation is superior; others, including some adherents of Advaita Vedanta, argue that Ishvara is a limited and ultimately inadequate representation of Brahman. Ishvara, as Avalokiteśvara in coitus with Tara, carries all the features of the male-female 'Elohim of Genesis. When referring to divine as female, particularly in Shaktism, the feminine Īśvarī is used. And Ishvara/Ishvari becomes Shiva-Shakti.

And down I went into the epiphany of being – a kind of jewelled seventh heaven where everything is illuminated and everything is illuminating. And there was Brahman exactly as in the near death experience. That thou art. Brahman is me. Brahman is my cosmic apotheosis manifest telepathically as one is to one. But Brahman isn't just here to say "Hi". He is saying the world is in acute peril – indeed the entire universe is in peril, because, if we self-destruct as we are heading towards doing, and conscious life on Earth as we know it ceases, we don't know that this great universe in which we exist can remain manifest, because we don't have certainty or even any knowledge that there is other life in the universe. Brahman is vulnerable too – eternally vulnerable. And Brahman is silently as one is to one saying to go back to your life and redeem the entire living universe as your life's work. You can do it because you are mortal on ground zero. Go to the ends of the Earth and stop short at nothing. And he imparted to me the elements of Symbiotic Existential Cosmology just as in Fred Hoyle's (1957) sci-fi novel "[The Black Cloud](#)" that took me weeks to begin to understand. That's the moksha epiphany transcending the incarnation cycle.

Likewise, Moses kept the flock of Jethro his father in law, the priest of Midian and he led the flock to the backside of the desert, and came to Horeb, the mountain of God. But he saw a flame of fire coming out of the midst of a bush: and he looked, and the bush burned with fire and was not consumed. And Moses said, I will turn aside, and see this great sight (experience this transformative vision), and discover why the bush is not burnt, and God called unto him out of the midst of the bush, and said, Moses, Moses. And he said, Here am I. Draw not nigh hither: put off thy shoes from off thy feet, for the place whereon thou standest is holy ground. And Moses hid his face; for he was afraid to look upon God. And He said, I have seen the affliction of my people which are in Egypt, and have heard their cry and I know their sorrows. And I am come down to deliver them out of the hand of the Egyptians, and to bring them unto a land flowing with milk and honey. And when Moses enquired what his people should call Him, He said unto Moses, I AM THAT I AM: and he said, Thus shalt thou say unto the children of Israel, I AM hath sent me unto you.

So Brahman is also 'Elohim and 'Elohim is just as vulnerable. Really the 'Elohim of Genesis one is male and female in the likeness of humanity as humanity's cosmic apotheosis, not the reverse. So the damning thing is that our self-centred egotism could literally lay waste to God, the Universe and everything if we don't perform the living redemption of the Tree of Life throughout our generations forever.

Shortly after, as it always happens, the spell broke, and I fell out of the nierika portal and Rohan was looking at me curiously and saying "Are you okay?" And I said "Yes thanks!" "I couldn't be more okay!" "I'm galvanised". And here we are thirteen months later and apart from the cosmology, which everyone looks the other way over, to neither confirm nor deny, so nothing has changed.

Chris Nunn: Stanislav Grof thought his 'holotropic breathwork' was second best to LSD for enabling 'higher' states of consciousness, but I don't think he ever said how or why. And you need to be a bit wary of physiological measures which generally have multifactorial determinants.

Chris King: LSD is too strong and unpredictable. Just take your fungal entheogenic toxins like a true visionary adult should, fearlessly with no hesitation or regrets! The universe evolved them for our realisation as a compensation for our species-dominant egotism destroying the biosphere. Although there are no guarantees, they are heads and tails over pure Vedanta and pure spirituality. Breathing and meditation is not a substitute but an adjunct. They aren't alternatives. As I showed you above, *fana* is also the way into moksha.

Epiphany 2

To understand the complementary relationship between (a) the physical and natural universe and (b) subjective conscious existence, we need to understand that the way the standard model of quantum physics and the symmetry-breaking of the colour and weak-electromagnetic forces occurred is (1) a critical indicator that the universe is absolutely destined to enable life to unfold including through natural evolution and for conscious life to be possible and (2) that the wave-particle complementarity of the quantum forces, especially electromagnetism as the most large scale force, (along with gravity), is key to subjective conscious volition over the quantum universe.

(1) Quantum physics is not just a ball and stick fatalistic mechanism but facilitates a highly creative life generating cosmological process. The chemical elements of life are a very subtle symmetry-broken products of the colour, weak and electromagnetic forces in interplay. You can't just cite carbon as a key element of life or ignore everything but the EM force, or you brutalise physics and turn it into a mechanistic unconscious nightmare. The reality is that the cosmic

production of the elements through symmetry-breaking leads to biomolecules and fractal tissue structures as the cosmological climax of life in paradise on the cosmic equator in space-time.

(2) Quantum uncertainty is built in in such a way as to just make it possible for subjective consciousness to have causal physical effect, as David Chalmers put very nicely on closer to the truth: *"If you wanted to have consciousness to effect physics, it looks like physics could not be designed more perfectly."*

The Elusive Subjective

Now this has a kick back to understanding what subjective consciousness is and what it isn't and why formally analysing it is specious. Primitive subjectivity is the effortless ability of the subjective 'Shivaic' aspect of cosmology to become moulded by the physical constraints of the 'Shakti' aspect of cosmological physics.

In very elemental contexts like quanta, all that can be realised is the root notion of consciousness as the historically-entangled special relativistic wave function spatio-temporally encoding the past and future of the quantum. The 'free will' is the intrinsic capacity for reduction of the wave packet in which a 'decision' is made. But there is no real evidence for adaptive integrated qualia. Things begin to get more interesting in butterfly effect systems, where there is a dynamical boundary condition filter in place in the global dynamic itself interacting with quantum uncertainty.

A discrete transition to attentive sentient consciousness occurs in the eucaryote endosymbiosis where chaotic sensitivity to physical modes, such as light (photons), vibrations (phonons), and orbital influences (olfaction) begin to lead to boundary filter constraints in the membrane dynamics where meaningful subjective qualia could in principle become expressed. With the multi-cellular brain these become "phenomenally" expanded, coupled with cerebral neurodynamic constraints to become the dynamic integrated qualia we call the experiences we can subjectively experience in the first person.

But as we described in Epiphany 1 these are framed by the formative neurodynamic constraints of the doors of perception filters we associate with sensory perceptual processing superimposed on the physical sensory constraints. These are not analysed by decomposing the adaptive capacity for coherent qualitative experience as a kind of subjective qualia mechanism in itself, but through causally open attentive-intentive neurodynamics.

Finally, because the universe evolves to interactive climax in the biota, although it is possible that other cosmic structures such as black holes, stars, galaxies, or Gaia herself could have primitive phenomenological volitional experience, the subjective aspect is clearly positioned to be a complement to the most elegant complex low energy interactive processes in the multicellular biota themselves and to be supremely adaptive to the doors of perception filters these provide for organismic survival in an uncertain environment.

So we are brought back square one to the overriding reality that (1) All forms of conscious and superconscious entity arise from and are manifest through the biota, including Brahman as ultimate reality and 'Elohim as "God" apotheosis. (2) That while the universe is necessary, subjective consciousness in the biota is primary without which it remains unclear the physical universe or the cosmic mind could become manifest.

So our conscious duty to the subjective aspect is, as stated in the first round, is living redemption, not futile attempts at mechanistic or structural analysis, which rather, disable the subject from active volitional agency over their affairs and world redemption.

Epiphany 3

So is my mushroom vision of Brahman (1) a meeting with ultimate reality as I claim, or it is just (2) a tale told by an idiot full of sound and fury signifying nothing, or (3) somewhere in between, some kind of hallucinatory 'false' vision of my own mortal angst projected into the kaleidoscopic aether?

Here are the reasons why (2) and (3) are completely mistaken.

1. A key interpretation of the Fermi Paradox – why there is no apparent evidence of life out there – is that It is the nature of intelligent life to destroy itself – the Medea hypothesis (Ward 2009). We are manifestly running this risk to the brink as I speak!

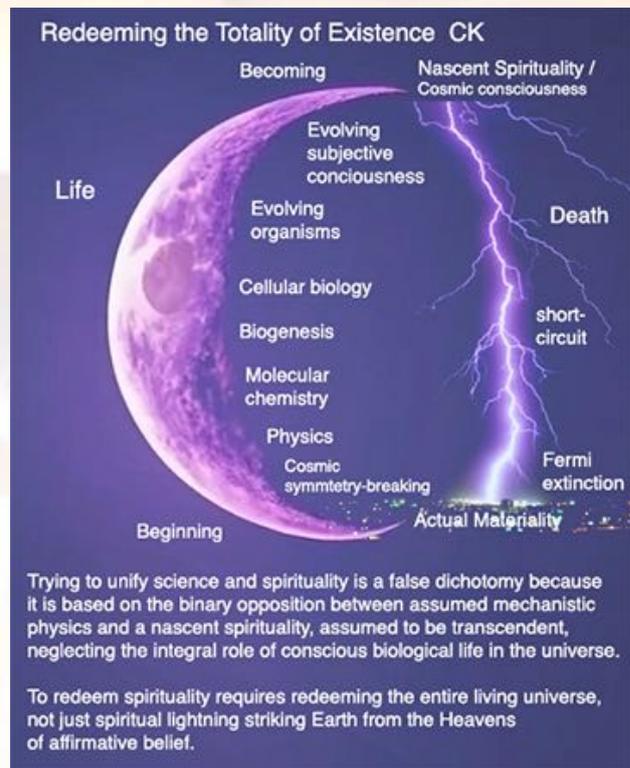

2. Brian Cox on the BBC ahead of COP26 warned that Earth's demise could rid galaxy of meaning Brian notes on the BBC that "Unique events that led to civilisation mean its demise could 'eliminate meaning in the galaxy for ever'. He is right and the conclusion is that this is not just what we are doing to ourselves and the diversity of life as a whole, but the living galaxy and the universe.

3. Uncertainty that life can Reboot: Although abiogenesis is eminently plausible scientifically, there is as yet **no empirical demonstration it can be achieved de novo**. Our scientific intelligence leads us to believe that the organic molecules produced in profusion in galactic gas clouds are eminently fecund to generate life where the conditions become possible but that the processes involved take about half a billion years on a goldilocks planet to come about but this remains only a scientific hypothesis. We can't afford to snuff life out on the casual assumption it can create itself from scratch.

4. Squandering the Cosmic Heritage: We do all need to have some root faith in the ultimate fecundity of life to regenerate itself anew, after all it happened didn't it? And because it did, we appeared. But we are already 13.5 billion years down the universe's evolution. The universe is no longer a babe in arms spawning the first blazars. Simply throwing up our hands helplessly and depending on this option to roll back human folly is far worse than futile. What more stupid fate could we envision for ourselves than to struggle for 500 million years to spark replicative life, another two billion years to form amoeba-flagellates and another billion years of unique evolution to get past the dinosaurs and finally become Homo sapiens, only to blow it apart in a nuclear holocaust through our own egotistical tribalism, or run the biosphere into the dirt by over exploitation? Recall that the only country which has prosecuted unilateral nuclear warfare is the US. This was a precedent humanity should have stepped back from and not set the die for the nuclear arms race. Although these conflicts have arisen from far right leaders namely Hitler and Stalin it is the democratic world that is guilty of nuclear warfare when Japan was already on the brink of surrender. We are also continually failing to learn the lessons from far right politics and the risks it invokes. Ironically, it is said that round 1911 the young Adolf Hitler took peyote during his formative period, provided him by apothecary Wilhelm Pretzsch, (Andrews 417-425) so that is a warning to a simplistic view of psychedelics and humanity.

5. False Religious Assumptions: We have no evidence whatever that there is an inscrutable ultimate reality called Brahman independent of our own experience of it. The evidence contradicts it. Moksha is so difficult to really achieve, the Vedantic tradition had to invent reincarnation to postpone full enlightenment. There is no convincing evidence that all the meditative and contemplative traditions have genuine transformative power over reality. There is no evidence whatever that a creator deity with root power over the universe exists independently of our belief systems. So my Brahman experience is as genuine as it gets and more transparently so than the contrived claims of the Yogis for which little has really changed in 2000 years.

6. Helplessness and Denial: Finally we all know the problem is that while all of us feel the Earth is heading towards existential crisis, none of you have any way to cope with the three key existential threats, the mass extinction of the diversity of life, human induced climate crisis and nuclear mutually assured destruction. We are living in the valley of the shadow of death and we know it. Some of you even try to claim climate crisis is a democrat deep state plot because you are choosing to drown in disinformation. But we know that we are burning all the coal that goes back 358 million years to the first great carboniferous forests and all the oily algal deposits of an age of 250 million years for the oil. We have to know this is disrupting and degrading and acting against the living Earth. Yet here we sit driving our autos and our urban food chains unable to get to these issues for selfish reasons of taxation, inflation and sheer personal ambition.

So what to do about it? We need to create a small world network based on limited degrees of separation to identify the three key existential threats – mass extinction of the diversity of life, human induced climate crisis and nuclear mutually assured destruction as primary objectives. We have spent decades trying to deal with the nuclear threat and remain on the brink of uncertainty if push came to shove. We can't let any of these drop until the planet is redeemed.

The Buck Stops at Karma My Dear

All this Covid episode and what it means comes down to karma, a philosophy I tend to despise but lives within me at all times, and particularly times of crisis. When I caught Omicron and went down hill fast I thought everything was utterly meaningless. Ukraine is in flames. The US is splitting itself apart and returning to religious chauvinism overturning the struggle for women's rights. And so it went. I tried to compile a few additions to the cosmology, which I will include, but otherwise it was pure ennui. Then I realised the buck still stops with me and I haven't fulfilled the karmic agenda. That's when I realised karma had struck (again) and regained my vitality and could eat again. And that's why I am sending these three epistles.

Let me explain what karma actually is. It's not a moral law, it's a manifestation of quantum singularity when the universe touches us on the shoulder. To take a very loose analogy, everyday life, as a bed of wine and roses is like sailing down our multiply entangled wave function. We are part of a great whole of life, offspring, world hopes of a better future, compassionate sentiments, the unifying power of love, the collective will to compassionate justice. There is no need to stick our necks out. But then there's the nitty-gritty – accidents happen, illness like covid, family, social and international crises. Here is where reduction of the wave packet comes into the forefront and shatters the equilibrium.

Just so as incarnate individuals, we are both singular and part of the great whole. But some of us become marked by our personal karma in a way which can set us apart. The mushroom trip that set off the cosmology, through unblinding my glaucoma with devastating insight has marked me. And going down the tubes with covid has marked the process with added significance, turning meaninglessness into acute urgency. The covenant has not been fulfilled. I still have to go to the ends of the Earth to save it and time is even shorter and the situation even more precarious.

I am a tragically marked man. From my birth on the Epiphany 1945 christened Christopher King, just as the plutonium came out of the Trinity test and headed for Nagasaki the die was cast. I am a/the foundational nuclear God child. You just try to find another Chris King born on the Hanford epiphany! Just remember Chris King is not just the cross bearer for Jesus. Christus Rex and Cristo Rey are literally Christ the King. The surname defines the genealogy. So does this have any significance? Delusions of grandeur you will doubtless say. "You are trying to save the world Saklas but you are sadly mistaken!"

The basic answer to this is that I am, and Symbiotic Existential Cosmology is, as a transparent affirmation, the ultimate remedy for survival of the human species and the immortal survival of the diversity of life. I am thus the bearer of the Logos of perennial immortality throughout our generations forever amen. This I swear, that I came into this world to bear witness to the truth, that I bare before you the long term future goodness of the age of Paradise. This is not the signature of a false prophet. Rather, the balance of the probabilities is that my vision is a rock of sustainability amid a swirling ocean of human folly and misadventure, on all sides, leading to existential crisis. The answer is judge wisely. Cast lots on your own garments, in advance to test the relative waters of veracity. Do not wait for your executioners to do it on your final day as happened to Jesus. Thus I am not Yeshua reincarnated. Nor am I pretending to be him.

*"I am as a man who is a new man, with new limbs and life,
and the light of the Morning Star in his eyes." (The Plumed Serpent).*

I could have easily paid no attention to my birth karma. But would that have been fair or considerate, if something could be done to protect life? As it was, I studied William James' "Varieties of Religious Experience", and later realised that psychedelics were more insightful than religious doctrine, wandered India as a sadhu and made a pilgrimage to the sources of the world's power plants. Then when I started seriously taking mushrooms, stranger things happened.

As an adolescent I had had a dream. I was in dry parched trees on the edge of the desert and a Lion was staring at me with eyes of both pity and deep contempt and sorrow, because I was of the species which was bringing nature to her knees. I realised I was the accursed Homo and so I made my way to my own kind – an almost endless queue of people

in a dark smoky city waiting for the chance to work in a factory for food. The dream haunted me. It affected my world view.

Mushrooms became my allies and my spirit nature and I realised from the work of Joseph Campbell and others that there was a deeper Jungian current of archetypal reality that could have played a part in the events of apocalyptic heroes such as Jesus. I realised the world was stuck in perpetual death-grip of re-celebration of Jesus' sacrifice and conceived of the idea that it was possible to make a second journey of spiritual renewal to correct what had gone wrong in the year zero and redeem the immortal age of paradise, not as Jesus' second coming, but as a true redeemer in the root tradition. The mushrooms encouraged this and their access to numinous reality realised it. Of course I couldn't reveal any of this because, at the time they were strictly class A prohibited drugs.

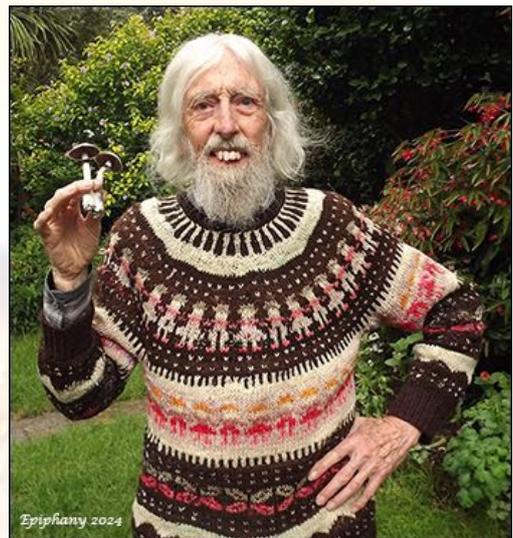

Stranger things happened. In the 1980s, the mushroom suggested that I make the millennial journey to Jerusalem if the world hadn't addressed the mass extinction of life by then. But then it came back with a horrific vision that somehow my daughter's fertility would be impaired as a consequence. Then her first offspring was born with Down syndrome. I had become adroit at casting lots on my garments to the extent that I was able to know enough of what I was up against, and made the millennial vigil, as an academic sabbatical hosted by liberal Jews in the Holy city with creditable flair as a stealth raid to celebrate the sacred reunion of woman and man and to reflower the Tree of Life as simple rites of passage to the new epoch.

Symbiotic Existential Cosmology is largely complete but it's a Rosetta stone artefact. The essential work is still to come.

Epiphany 4

Before we go further, there are some things we really need to very carefully understand. Mushrooms are not just hallucinatory agents. They are not hallucinatory agents at all. They show you ultimate realities that are visions that, once they have entered us can become devastatingly true. When you enter a mushroom vision you are taking on more than you can possibly anticipate.

As Maria Sabina put it: *'There is a world beyond ours, a world that is far away, nearby and invisible. The more you go inside the world of teonanacatl, the more things are seen. And you also see our past and our future, which are there together as a single thing already achieved, already happened ... Millions of things I saw and knew. And there is where God lives, where the dead live, the spirits and the saints' ... I knew and saw God: an immense clock that ticks, the spheres that go slowly around, and inside the stars, the earth, the entire universe, the day and the night, the cry and the smile, the happiness and the pain. He who knows to the end the secret of teonanacatl – can even see that infinite clockwork'.*

We always have to be very careful with what our visions wish on the world. Take my declaration of jihad in the [Song of the Biosphere](#) which promptly came true a month later on 9-11.

*when it comes to the final struggle - jihad of the biosphere
there's only one true rogue nation - the great American shaitan*

*can we fly so high we'll pass right to the other side
and never fall in flames? will we ever be the same again*

*we'll become the living soul, the primal source, the shining goal
the beginning and the end of life, the happiness and the pain
can we bear it all again?*

When we enter the visionary state we have to bear in mind that our own shortcomings may lead us to subtly distort the vision and lead either towards heaven or hell, as Aldous Huxley (1954) warned. We don't want to adhere to the fallacious view that war is necessary, or that success of an outcome requires a compensating sacrifice to God.

So when I had the horrific vision that my daughter's fertility might become occluded as some sort of sacrificial consequence of me attempting to overturn the Christian tradition of blood sacrifice to celebrate an empty cannibalistic Eucharist sacrament, consuming Christ's flesh and blood, this was no pretentious Aztec vision nor anything I wanted in any way to come to pass. The real source of this notion comes not from some Aztec mushroom delusion but the diabolical sacrificial nature of Christianity itself. To me God giving his only begotten son as a sacrifice for sin is the equivalent of Huitzilopochtli sacrificing Moctezuma so that his followers could be forgiven their homicidal sins.

The canonical gospels all make clear this sacrifice is and remains central to the Christian concept of God:

*And he began to teach them, that the Son of man must suffer many things,
and be rejected of the elders, and of the chief priests, and scribes,
and be killed, and after three days rise again. And he spake that saying openly (Mark 8:31).*

*For God so loved the world, that he gave his only begotten Son,
that whosoever believeth in him should not perish, but have everlasting life (John 3:16).*

And almost all things are by the law purged with blood; and without shedding of blood is no remission (Heb 9:22)

This means Abba is not a loving father, but a filicidal demiurge, however you try to pretend otherwise. Every Christian needs to take personal responsibility for the false vision they are perpetuating. It is truly sinful to turn a blind eye. James Tabor (2015) has [set the record straight](#) about Yeshua's actual role in this, accurately linking it to be an insertion in Mark that reflects a vision of Paul and is thus not Yeshua's actual words.

Christianity is thus an empty sacramental tradition, waiting for the biospheric sacraments of the natural entheogens to become recognised and established as a critical healing between our dominant species and the living biosphere upon which we depend for our own survival.

You all need to appreciate that, in coming to these strange messianic and sacrificial visions, I was a tenured academic taking mushrooms on an almost weekly basis, knowing that I was guarding the true visionary sacrament which could redeem humanity and bring about the epoch of long-term future goodness under the banner of reflowering the Tree of Life, announced discretely in Jerusalem in the millennium, while Yeshua's body continued bleeding to death in every Christian church altar, so that his followers could figuratively consume his flesh and blood in an empty powerless token to endlessly facilitate his ascendance on the third day to save them from their sins.

So the source of my dark vision, even though the mushroom was speaking the whole truth of what would come to pass a decade later, was in a sense the mildest possible accomodation to this unbelievably diabolical two thousand year cannibalistic ground hog day that had turned into martyrdom, Empire, Crusade, witch hunt and Inquisition. Anyone in the Christian tradition, before making any attempt to justify the overall good influence of the Western sacramental tradition needs only to turn to [Perpetua's untimely martyrdom](#), and contrast it with the spirit catcher image below, to say which sacramental path is true to life – the Eucharist, or the flesh of the Gods – Teonanácatl.

I clearly in all truth as a guardian of humanity and life as a whole, recognising the true status of the living sacraments in relation to the Western sacramental tradition, had and have a duty to redeem this diabolical belief, crafted by Pauline Judaic Hellenism, but it doesn't need any form of sacrifice, as Christianity claims, to overturn it! Just accepting the horrific sacrificial vision is real when we have to know in our heart of hearts it is a wholly corrupt fallacy. How any Christian on Earth can not see how fundamentally wrong and unethical this is, or pretend this is the basis of a true religion, leaves me aghast. There can be no justification, and no rationalisation in terms of Christian brotherly love, eternal life or anything else for this.

Re-Liberating Matriarchal Fertility

But the vision did come true a decade later, and my daughter's first child emerged with Down syndrome, five years before my vigil to Jerusalem. So what does a loving father do, when it seems that their accidental vision of fertility sacrifice appears to have actually come true, whether it actually caused the events or not? That father has to try to set in motion a counter-vision of redemption and fulfilment to heal the travesty.

Many parents have children with Down syndrome and love them dearly, but there is a risk that caring for a disadvantaged first child can lead a new couple both to feel that they should devote their future life to the care of a dependent child and to lose faith in their own fertility and a full future family life together. This would just cement a bad vision into a perpetuity of undesirable outcomes.

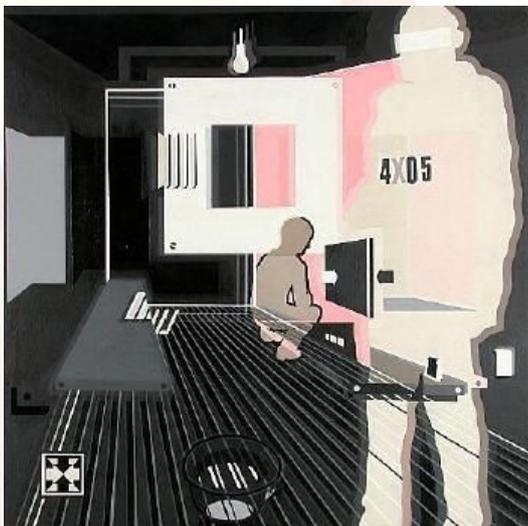

So seventeen days after the birth, I began a clandestine project of renewal. I secured the image of the uncompleted spirit catcher above. I then created the Fair Isle design in the second image. Finally I knitted the design into a tiny jacket for a newborn baby with the spirit catcher on the back. It was really much too small for a baby and was intended to give them both the hope and confidence in one another and in the fertility of life itself to make a real family future possible and gave it to them over an evening meal. Her husband looked at it rather despairingly and threw it in the boot of the car as he left, but three years later a healthy baby boy was born, then seven years later after even more reluctance, a third healthy baby boy and the family was at last, a living proof of redemption of matriarchal fertility from dark visions.

Fig 260: Sprit Catcher Baby Cardigan

So please remember carefully that mushrooms are far more than a hippie flash in the pan, or some kind of adolescent party kicks. As Maria Sabina said, they hold within them a reality we have barely begun to penetrate. There are more intense agents like LSD, but it's not the sheer strength of the effects but the reality they reveal that is the key.

Outside the Inside Out

I have spent all my life up to 77 trying to genuinely explore the nature of the universe and discover ways in which physical reality, particularly at the quantum level can give rise to the enigma of conscious experience. The same for the AdS/CFT correspondence and pseudoparticles like the helium 3 fluid and particulate phases and even tachyons, let alone vying with Hameroff and Penrose and David Chalmers at Tucson Quantum Mind 2002.

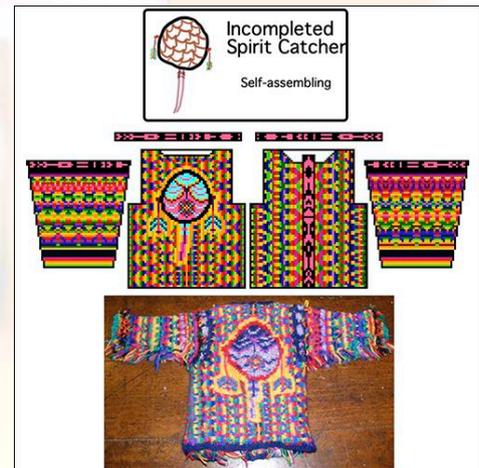

That was all okay until that very mild dose of mushrooms in mid-2021, which flipped my universe inside out. Way back in the 1960s as a student, there was an acquaintance, Harry Wong, who painted an enigmatic art work "Outside the Inside Out" of his jail cell, about the same time I first read about LSD the insanity drug in a local tabloid. Today on spec thinking of writing this e-mail, already holistically conceived before the words that are now flying off the tips of my fingers, I casually went on Google and thanks to Pinterest, there is one and only one image remaining.

Fig 261: Outside the Inside Out (Wong)

Now the title is a pun on an image of his jail cell for drug possession, probably hard drugs, but the metaphor is a potent expression of what happens when, after literally hundreds of wild trips seeking white light illumination, in a karmic twist due to having acute closed angle glaucoma and lens replacement eye

surgery and taking a very mild exploratory dose of mushies to see if my eyes can stand it and suddenly finding I had fallen completely outside the inside out of the "bubble of perception", as Carlos Castaneda (1968) called it and into the nierika as the Huichol describe, I was in an NDE with Brahman and so the story goes ...

This is an event for me just like Buddha discovering the death and decay he had been sheltered from when he left the shelter of the royal chambers, and it comes with a huge sting in the tail. Everything I have lived for in the quantum connection that makes physics able to evoke the conscious mind materially came apart and I had to put it all together from the other side of the Styx.

The end result is a cosmological ground shift away from the occluded story of how the brain does it all the way back to veridical reality and the efficacy of subjective conscious volition over the physical universe and the cosmological axiom.

At the same time I discovered Gallego & Dakić's (2021), little arxiv paper which shows that the whole idea of the border post between the classical and quantum worlds can be an illusion in biology where non-IID processes are the key to brain dynamics and evolution.

This freed me from having to find some idiosyncratic pseudo-physical connection to make the "brain makes mind" idea feasible.

It is transparently obvious if you take even a small step back from this obsession to find the mechanism, that the whole dynamic of the organism from quantum wave function and measurement, through molecular folding and kinetics, through enzyme active site quantum tunnelling, ion channel kinetics, open system quantum chaos, edge of chaos instability, and the fractal structures of membranes, ribosomes cell organelles through cells, to tissues and the whole conscious organism is one macroscopic resonant quantum system that can never be decomposed cleanly into interacting mechanistic parts.

Falling outside the inside out means also that I can dispense entirely with speculative pseudo-scientific reasoning and just add one minimal axiom confirmed by any of us that are honest with ourselves even to go to the toilet or to eat, let alone ponder serious thoughts or have deep psychedelic insights. That's the bare bones of it!

The Bushmen always carry poisoned arrows for hunting and like all of us they fear infidelity, there is a saying: As one of the !Kung men in an argument about a marriage put it to his adversary, their dispute could be quickly settled with an arrow. "**Just one little arrow**".

The cosmological axiom that subjectivity is primal extending physical cosmology, although full consciousness emerges later with the eucaryote endosymbiosis, is **that little arrow**, leading to mutual affirmation that subjective consciousness has efficacy of volition over the physical universe, freeing us from both materialistic and religious bondage as transformative conscious agents protecting life in the universe.. It justifies recognition for what it actually achieves in clarification of subjective reality for the benefit of life as a whole and the integrity of our cosmological account of reality.

Closing the Circle

Just to come full circle over the karma of the glaucoma and the cosmology mushroom vision, and this acute Omicron BA5 episode, in the middle of writing this epistle this morning, suddenly I could no longer see the words "self-assembling" in the top image in the figure. I tested both eyes and I couldn't see it in either, so it wasn't my new synthetic eye lenses or my retinas. Then I realised I couldn't read any of the text I had just composed because half of it was disappearing, so it was in my visual cortex. Was this the end of my visual life? Was this the moral punishment for my bad karma? I looked at my face in the mirror and there were no eyes, just a blur. Had I caused a stroke trying to go to the toilet? I began to see fortification patterns and decided to place my faith in waiting it out as a kind of migraine aura. About thirty minutes later everything settled down to normal. But it's a warning to everyone who reads this not to depended on me to save the world for you.

I have a [scientific research web site](#) updated in real time with a comprehensive description of scientific reality from quantum cosmology through the evolution of the tree of life from biogenesis to humanity and neuroscience:

[Quantum Reality and Cosmology](#)

[Biocosmology](#)

[The Tree of Life: Tangled Roots and Sexy Shoots:Tracing the genetic pathway from LUCA to Homo sapiens](#)

[Humanity's Evolutionary Heritage](#)

[Culture Out of Africa](#)

[Entheogens, the Conscious Brain and Existential Reality](#)

On the shadow side I have descended for decades into psychedelic states and spent whole seasons submerged in spiritual reality with fresh first person visionary eyes to see right into the events that invoked the human spiritual consciousness and the weird karmic twists therein all the way back to 150,000 years ago. That is the shadow side that is generally occluded.

I would be wasting my existence if I didn't use this qualification when it is most needed to ensure our survival and transform both the scientific and religious paradigms. Like all good shamans that's what I was born to do. So I am trying to make the religious paradigm shift from the centre of the cyclone, because that is where the beginning and end of time lies and where the uncertainties go wide open right at the source that evoked it all. All the beings that have gone before us are complexes of life-long non-IID quantum interventions, each life history constituting a unique quantum instance from creation to annihilation. I am trying to use mine fully aligned to good effect to transform our understanding to regain planetary immortality. Because it is to put our attention on the highest possible Self in the Now, where all the possibilities for transformation lie.

Fig 262: If you would like to hear this weird quantum reality sung in a beautiful accounting here it is: [Kitten's Cradle](#) [lyrics](#)

The onus on us is to bring forth what we have within us. If we do, these words come true and the entire epoch is realised.

*"That which you have will save you if you bring it forth from yourselves.
That which you do not have within you [will] kill you if you do not have it within you."
(Gospel of Thomas 70)*

Aldous Huxley, Moksha and the Yellow Mushroom

This section contains key excerpts from "Moksha" (Huxley 1962) his edited posthumous writings, his lecture on visionary experience and his peaceful death on LSD, that is a fitting sequel to his representation of a similar passing away in his climax novel Island. I am including this in retrospect because of a karmic experience I had in February 2024 realising that Huxley had named the sacrament in his novel "Island" (1962) moksha or moksha-medicine, which I had completely overlooked in my experience of a more Vedic moksha experience of union with Brahman in the formative mushroom experience that precipitated this work. Because I had read "Island" in the heady LSD days a decade before I had an opportunity to experience natural entheogens, and like many others saw "Island" and the "yellow mushroom" as science fiction, when he was talking about gold tops, the connection to the actual sacred mushroom and moksha had literally passed me by. Symbiotic Existential Cosmology is very much a descendent of Huxley's vision in "Island" so am including this short section in recognition of his heritage.

Huxley's last novel [Island (1962)] - the crowning work of his final decade - took him five years to write. For perhaps the only time in his writing career he questioned, his creative ability to successfully 'poetize and dramatize the intellectual material and create a work which would be simultaneously funny, tragic, lyrical and profound'. To Osmond he described the task as 'trying to imagine what could be done to create a good society, dedicated to eliciting all the latent powers and gifts of individuals ...' He worked into the book some of Laura's psychotherapy techniques. Island is dedicated to her: The Doors of Perception was dedicated to Maria: as Sybille Bedford notes, these are the only books among the nearly fifty Aldous published which bear dedications.

The Islanders - the Palanese – use a drug called moksha: a kind of perfected psychedelic in the form of a cultivated, yellow mushroom growing in the mountains. The substance is also called 'moksha-medicine' and provides 'the full-blown mystical experience'. Unlike the soma of Brave New World, moksha is not for escapists: a major ethic of the Islanders is 'paying attention'. In a rite-of-passage ceremony in which the drug is given to Palanese youth, the guide reveals its essential message: 'Liberation . . . the ending of sorrow, ceasing to be what you ignorantly think you are and becoming what you are in fact. For a little while, thanks to the moksha-medicine, you will know what it's like to be what in fact you are, what in fact you always have been.'

A key extract from 'Island': This focuses on the key ingredients of Huxley's vision of world healing in the context of the Palanese, the nature of organic natural visionary transcendence, the yellow mushroom, the very name moksha medicine and the reaction of the paranoid world at large which ultimately culminates in the tragic invasion of earthly paradise.

'Sex is different here,' Murugan insisted. 'Because of the yoga of love?' Will asked, remembering the little nurse's rapturous face. The boy nodded. 'They've got something that makes them think they're perfectly happy, and they don't want anything else.' 'What a blessed state!' There's nothing blessed about it,' Murugan snapped. It's just stupid and disgusting. No progress' only sex' sex' sex' And of course that beastly dope they're all given. 'Dope?' Will repeated in some astonishment' dope in a place here Susila had said there were no addicts? 'What kind of dope?' – It's made out of toadstools. Toadstools!, He spoke in a comical caricature of the Rani's vibrant tone of outraged spirituality'. 'Those lovely red toadstools that gnomes used to sit on?' 'No, they are yellow.' People used to go out and collect them in the mountains. Nowadays the things are grown in special fungus, beds at the High Altitude Experimental Station' Scientifically cultivated dope' Pretty' isn't it?'

'What's in a name?' said Dr Robert with a laugh. "Answer, practically everything. Having had the misfortune to be brought up in Europe, Murugan calls it dope and feels about it all the disapproval that, by conditioned reflex, the dirty word evokes. We, on the contrary, give the stuff good names - the moksha-medicine, the reality revealer, the truth-and-beauty pill. And we know, by direct experience, that the good names are deserved. Whereas our young friend here has no first-hand knowledge of the stuff and can't be persuaded even to give it a try. For him, it's dope and dope is something that, by definition, no decent person ever indulges in.'

'What does His Highness say to that?' Will asked. Murugan shook his head. 'All it gives you is a lot of illusions,' he muttered. 'Why should I go out of my way to be made a fool of?' 'Why indeed?' said Vijaya with good-humoured irony. 'seeing that, in your normal condition, you alone of the human race are never made a fool of and never have illusions about anything!' 'I never said that,' Murugan protested. 'All I mean is that I don't want any of your false samadhi. 'How do you know it's false?' Dr Robert inquired. 'Because the real thing only comes to people after years and years of meditation and tapas and... well, you know - not going with women.' 'Murugan,' Vijaya explained to Will, 'is one of the Puritans. He's outraged by the fact that, with four hundred milligrams of moksha-medicine in their bloodstreams, even beginners - yes, and even boys and girls who make love together - can catch a glimpse of the world as it looks to someone who has been liberated from his bondage to the ego.'

'But it isn't real,' Murugan insisted. 'Not real!' Dr Robert repeated. 'You might as well say that the experience of feeling real isn't real.' 'You're begging the question,' Will objected. 'An experience can be real in relation to something going on inside your skull but completely irrelevant to anything outside.' 'Of course,' Dr Robert agreed. 'Do you know what goes on inside your skull, when you've taken a dose of the mushroom?'

'We know a little.' 'And we're trying all the time to find out more,' Vijaya added' 'For example,' said Dr Robert, 'we've found that the people whose EEG doesn't show any alpha-wave activity when they're relaxed aren't likely to respond significantly to the moksha-medicine. That means that, for about fifteen per cent of the population, we have to find other approaches to liberation.' 'Another thing we're just beginning to understand,' said Vilaya' 'is the neurological correlate of these experiences. What's happening in the brain when you're having a vision? And what's happening when you pass from a pre-mystical to a genuinely mystical state of mind?'

'Do you know?' Will asked. "Know" is a big word. Let's say we're in a position to make some plausible guesses. Angels and New Jerusalems and Madonnas and Future Buddhas - they're all related to some kind of unusual stimulation to the brain areas of primary projection - the visual cortex, for example. just how the moksha-medicine produces those unusual stimuli we haven't yet found out'. The important fact is that, somehow or other, it does produce them' And somehow or other, it also does something unusual to the silent areas of the brain, the areas not specifically concerned with perceiving, or moving, or feeling.' 'And how do the silent areas respond?' Will inquired.

'Let's start with what they don't respond with" They don't respond with visions or auditions, they don't respond with telepathy or clairvoyance or any other kind of parapsychological performance. None of that amusing pre-mystical stuff Their response is the full-blown mystical experience. You know - One in all and All in one, The basic experience with its corollaries - boundless compassion,

fathomless mystery and meaning.' 'Not to mention joy,' said Dr Robert, 'inexpressible joy.' 'And the whole caboodle is inside your skull,' said Will. 'Strictly private. No reference to any external fact except a toadstool' 'Not real,' Murugan chimed in. 'That's exactly what I was trying to say,' 'You're assuming,' said Dr Robert, 'that the brain produces consciousness. I'm assuming that it transmits consciousness' And my explanation is no more farfetched than yours. How on earth can a set of events belonging to one order be experienced as a set of events belonging to an entirely different and incommensurable order? Nobody has the faintest idea. All one can do is to accept the facts and concoct hypotheses. And one hypothesis is just about as good, philosophically speaking, as another. You say that the moksha-medicine does something to the silent areas of the brain which causes them to produce a set of subjective events to which people have given the name 'mystical experience.' I say that the moksha-medicine does something to the silent areas of the brain which opens some kind of neurological sluice and so allows a larger volume of Mind with a large "M" to flow into your mind with a small "m". You can't demonstrate the truth of your hypothesis, and I can't demonstrate the truth of mine. Even if you could prove that I'm wrong, would it make any practical difference?' 'I'd have thought it would make all the difference,' said Will.

'Do you like music?' Dr Robert asked. 'More than most things.' 'And what, may I ask, does Mozart's G-Minor Quintet refer to? Does it refer to Allah? Or Tao? Or the second person of the Trinity? Or the Atman-Brahman?' Will laughed. 'Let's hope not.' 'But that doesn't make the experience of the G-Minor Quintet any less rewarding. Well, it's the same with the kind of experience that you get with the moksha-medicine, or through prayer and fasting and spiritual exercises. Even if it doesn't refer to anything outside itself, it's still the most important thing that ever happened to you. Like music, only incomparably more so. And if you give the experience a chance, if you're prepared to go along with it, the results are incomparably more therapeutic and transforming.

So maybe the whole thing does happen inside one's skull. Maybe it is private and there's no unitive knowledge of anything but one's own physiology. Who cares? The fact remains that the experience can open one's eyes and make one blessed and transform one's whole life.' There was a long silence. 'Let me tell you something,' he resumed, turning to Murugan. 'Something I hadn't intended to talk about to anybody. But now I feel that perhaps I have a duty, a duty to the throne, a duty to Pala and all its people - an obligation to tell you about this very private experience' perhaps the telling may help you to be a little more understanding about your country and its ways.' He was silent for a moment; then in a quietly matter-of-fact tone, 'I suppose you know about my wife,' he went on. His face still averted, Murugan nodded. 'I was sorry,' he mumbled, 'to hear she was so ill.' 'It's a matter of a few days now' said Dr Robert. 'Four or five at the most. But she's still perfectly lucid. perfectly conscious of what's happening to her' Yesterday she asked me if we could take the moksha-medicine together' We'd taken it together,' he added parenthetically, 'once or twice each year for the last thirty-seven years - ever since we decided to get married' And now once more - for the last time, the last, last time. There was a risk involved, because of the damage to her liver- But we decided it was a risk worth taking. And as it turned out, we were right' The moksha-medicine - the dope, as you prefer to call it - hardly upset her at all. All that happened to her was the mental transformation.'

He was silent, and Will suddenly became aware of the squeak and scrabble of caged rats and, through the open window, the babel of tropical life and the call of a distant mynah bird. 'Here and now, boys. Here and now ...' 'You're like that mynah,' said Dr Robert at last. 'Trained to repeat words you don't understand or know the reason for' "It isn't real It isn't real" But if you'd experienced what Lakshmi and I went through yesterday you'd know better. You'd know it was much more real than what you call reality. More real than what you're thinking and feeling at this moment. More real than the world before your eyes. But not real is what you've been taught to say. Not real, not real.' Dr Robert laid a hand affectionately on the boy's shoulder. 'You've been told that we're just a set of self-indulgent dope eaters, wallowing in illusions and false samadhis. Listen, Murugan - forget all the bad language that's been pumped into you. Forget it at least to the point of making a single experiment. Take four hundred milligrams of moksha-medicine and find out for yourself what it does' what it can tell you about your own nature, about this strange world you've got to live in, learn in, suffer in, and finally die in' Yes, even you will have to die one day - maybe fifty years from now, maybe tomorrow. Who knows? But it's going to happen, and one's a fool if one doesn't prepare for it.' He turned to Will' 'Would you like to come along while we take our shower and get into some clothes?'

Visionary Experience

The following is an extract from Huxley's 1961 lecture on Visionary Experience, which overviews all traditions and methods of gaining access to visionary states from religious, through deprivation and flagellation to shamanic and pharmaceutical.

ACCESS TO THE VISIONARY WORLD

Spontaneous Access. Before I go on to talk about the actual nature of this internal visionary world, let me say a little about the means of access to that world. Some people spontaneously go there; they seem to be able to move back and forth without any difficulty between the visionary world and the workaday, biologically useful world of our ordinary experience. You get people, for example, like William Blake, who is constantly moving back and forth between the two worlds. Blake had a period in middle life when he was unable to visit the visionary world. For about twenty years he didn't see it. He used to see it in his youth, and then again in his old age he was able to go into it quite freely. And we have, I think, plenty of cases of poets and artists who have gone back and forth from one world to another. There are very beautiful and very detailed descriptions of the visionary world given to the Irish poet, George Russell - who wrote under the name of A.E. - where he describes his own experiences of going back and forth into this luminous world within the mind. There are these spontaneous cases where a privileged few are able to visit the other world and come back again safe and sound. Then I think we can also say that, in a very large number of children - I don't know what the proportion is; I don't think it has ever been systematically investigated - but in a good number of children, there is this capacity to live in a kind of visionary world. They see both within and without this transfigured luminous world. It is of course the world described by Wordsworth in his famous Ode on the Intimations of Immortality from Recollections of Early Childhood. I think a great

many children have exactly the kind of Intimations of Immortality which Wordsworth described. Then in due course, as they are subjected to our system of analytical and conceptual education, they lose the capacity of seeing this other world which gradually, in Wordsworth's words, 'fades into the light of common day'. From having lived in a world which had 'the glory and the freshness of a dream', they return to this rather boring, rather drab world in which most of us pass our lives. I would say, in passing, that one of the major problems of education is how do we help children to make the best of both worlds? How do we help them to make the best of the world of primary experience (and of this extension of primary experience: visionary experience) and at the same time help them to make the best of the world of language and the best of the world of concepts and general ideas? At present our system of education seems almost a guarantee that while we teach them how to use words and concepts, we wipe out this other world of beauty and higher reality which so many children live in.

These are two cases of spontaneous awareness of the other world, of the visionary world. Another class of people who have this awareness spontaneously is the class of the dying. Readers of Tolstoy will remember in that extraordinary story *The Death of Ivan Ilyitch*, that at the end of his unutterable sufferings and miseries, this wretched man feels that he is being pushed into a black sack, deeper and deeper, and suddenly, within a few hours before he dies, he perceives that the bottom of the sack is open and at the end of it is a light. This is not merely a literary invention. In recent months Dr Karlis Osis, of the Parapsychology Foundation of New York, has been sending out questionnaires to a large number of doctors and nurses getting them to give reports of the state of mind of patients on their deathbed. The interesting thing is that he has, I think, about 800 answers from doctors and nurses who report that, spontaneously, patients on the verge of death did have these tremendous visionary experiences of light, of luminous figures. It is a most interesting fact to find that this phenomenon, which has been reported of course in literature in the past, is now statistically confirmed. This is one of the most fascinating things that professional psychologists are doing now. They are confirming, by questionnaires and in the laboratory, all kinds of things which were intuitively known, and known by observation, and recorded in a casual way by literary men and philosophers in the past. Well, as I say, this represents a third class of spontaneous cases. Now we have to go on to the induced cases.

Induced Access. The fact that visionary experience has always, at all times and everywhere been very highly valued, means that at all times and in all cultures systematic efforts have been made to induce this experience. The experience can be induced in a variety of ways. Let us quickly go through a few of them.

One method is hypnosis. Under deep hypnosis a certain number of people (not very many, but I have seen a few) do evidently enter this world and report very strange and interesting happenings: they see figures, they see luminous landscapes, and so on. These are not very common phenomena, but it is interesting to know that there are a certain number of people who can be transported into this other world by hypnosis. There are other psychological methods for getting into the other world, and one of the best known in the Orient of course is the method of one-pointed concentration, the traditional Yoga method of excluding everything except one particular point on which the attention is concentrated. This in many cases does seem to result in breaking through the barrier surrounding our ordinary, day-to-day, biologically utilitarian world of consciousness, and breaking through into another mode of consciousness, the visionary mode. There is yet another method which has been practised, of course, within all the great religious traditions, the method of what is now called sensory deprivation, or the limited environment. Here again it is most interesting to find professional psychologists repeating, in the laboratory, work which was done for metaphysical and religious reasons by hermits and saints living in caves in the mountains or in the desert. It is a very extraordinary fact that when we do limit the number of external stimuli or cut them out altogether, as can be done with some difficulty, then in a relatively short time one's mind starts producing tremendous visionary experiences. Historically we see such figures as Saint Anthony and the monks of the Thebaid in the fourth century in the Egyptian desert, and we see again the hermits of the Himalayas, the Tibetan and the Hindu hermits who lived in complete isolation in the caves. For example, if you read the life of Milarepa, the great Tibetan hermit, or if you read the lives of St Anthony and St Paul, the hermit in the Christian tradition, you can see that this isolation did in fact produce visionary experiences.

And it is interesting, as I say, to see these facts confirmed by such contemporary workers as D' O. Hebb at McGill in Canada, or my friend Dr John Lilly at the National Institute of Health in Washington. Lilly has probably gone further than anyone else in creating a limited environment. He immerses himself in a bath at the temperature of 96, has himself fastened into a harness so that he can hardly move, breathes only through a snorkel so that even his face is covered with water and there is no differentiation of sensation on any part of his body, and within three or four hours he is having tremendous visionary experiences. Now the interesting thing is that like St Anthony's, most of these visionary experiences are extraordinarily unpleasant, and I have asked Dr Lilly to describe these experiences but he would never tell me exactly what they were, except that they were very, very unpleasant indeed. St Anthony, as anybody who has ever visited any picture gallery knows, was also subjected to extremely unpleasant experiences, but he occasionally evidently had genuine mystical and divine experiences. It is interesting too that, in all the religious traditions, deserts and places where there is a minimum of sensory stimulation have always been regarded in an ambivalent way, first of all as the places where God is nearest and secondly as the place where devils abound. We find in the New Testament, for example, that the devils who are cast out by Jesus go into the desert because this is the natural place, the habitat, of devils. But again, hermits who lived in the deserts in the fourth century say they went there because this is the place where one can get nearer to God than anywhere else. As I say, it is extremely interesting to find that these ancient religious practices can be and have been confirmed in the laboratory of modern psychological workers.

Another method of getting into the other world is the method of systematic breathing. Breathing exercises were of course developed most systematically in India, and we find traces of them in the Western tradition, particularly in the Greek Orthodox Church tradition where people did evidently employ some breathing methods, and even in individual Western mystics' I am thinking of Father Surin, the French seventeenth-century Jesuit, who speaks about the different modes of breathing, though he doesn't exactly describe what they were. The significant fact about breathing is that I think one can say that all these elaborate breathing exercises tend to end up

in prolonged suspensions of breath. A prolonged suspension of breath necessarily means a growing concentration of carbon dioxide in the blood. Again, it is well known that high concentrations of carbon dioxide do produce very remarkable and startling visionary experiences in the mind, so that we see here, in an empirical way, that people in all the religious traditions of the past made use of methods for changing the body chemistry, in such a way that visionary experiences would become facilitated. This again is the physiological reason, not the metaphysical or the ethical reason, for such practices as fasting.

Fasting has been employed in virtually all the cultural traditions, among other things for the purpose of inducing visions. For example, in a primitive Indian society in America this was a regular part of the initiation of the adolescent young men. They went out into the forest or into the prairie and fasted until they got a vision of the god they were looking for, and in due course they always did get a vision. The methods of fasting of course have been used in every religious tradition. These psychological effects of fasting have been confirmed in the large study by Keys called, *The Biology of Human Starvation*. There is a most elaborate description of what happens after a long period of abstention from food, and among the things that happen are these visionary experiences. We know too that the inadequate amounts of vitamins as well as merely inadequate amounts of calories also produce profound psychological changes. There are profound psychological changes in pellagra, for example, and in beriberi. Here again it is interesting, with the knowledge that we now have, to look back over history and to see why a period like the Middle Ages was probably far more fruitful in vision than a period of the present time. The reason very simply is that we are simply stuffed with vitamins and they were not. After all, every winter in the Middle Ages there was a period of extreme vitamin deficiency: pellagra and the other deficiency diseases were very common. On top of a long period of involuntary fasting came the forty days of Lent where voluntary fasting was imposed upon involuntary fasting, so that by the time Easter came around, the mind was completely ready for any kind of vision. I think there is no doubt that this is one of the reasons why spontaneous visionary experiences are a good deal less common now than they were; it is simply a dietary factor. In the past, in earlier civilization, a rather deficient diet tended to make certain types of visionary experiences possible, whereas now our very full diet tends to block them off.

Among other methods of transporting the mind to the other world was the deprivation of sleep. You find this in all the religious traditions: the sleep is reduced and the mind is made open and ripe for visionary experience. Here again it is interesting to see the professional psychologist confirming the findings of the past. My friend Dr J West a year or two ago had the occasion to supervise the sleeplessness period of a man who was a disc jockey on an American radio station. For a bet he had resolved to go without sleep for I forget how many days, ten or twelve days. Dr West supervised this and he told me that it was very interesting, after about seven or eight days, how this man was living in a completely visionary world with breakings-in of every kind of strange visions, some horrible and some rather beautiful. So here again we see an interesting confirmation of old empirical findings, in the modern laboratory. Even the medieval habit of austerities or self-imposed punishment was probably also extremely conducive to visions. Self flagellation, for example: if you analyse what the effects of this sort of proceeding were, it is quite clear that they all made for visionary experiences. They first of all released a great deal of adrenalin, a great deal of histamine, both of which have very strange effects on the mind, and then in the Middle Ages, when neither soap nor antiseptics existed, any wound which could fester, did fester, and the breakdown products of protein got into the bloodstream. We also know that these things do have very strange and interesting psychological effects. In confirmation of this it is very curious to read of the remark by the great French nineteenth-century Cure d'Ars (and now canonized as Saint Jean Vianney) who was forbidden by his bishop to indulge in the extremely severe austerities, the self-beatings which he had practised as a young man, and he said nostalgically, 'When I was allowed to do what I liked with my body, God would refuse me nothing.' This is a very interesting psychological statement, that evidently there are psychological reactions on the biochemical level which, connected with this kind of self-torture, do tend towards visions.

Chemical Access. Let us now pass into a final class of vision-inducing procedures; these have to do with the ingestion of various chemicals. Now as the French anthropologist Philippe de Felice showed some twenty years ago in his book *Poisons Sacres Ivresses Divines*, virtually in every religious tradition, both civilized and primitive, use has been made of mind-changing drugs used for the purposes of inducing visionary experiences. Every kind of chemical substance has been used for this purpose. The most anciently recorded, I suppose, is the soma of the Indians. Nobody knows, I think, what the plant soma was. It has been identified as the Asclepias or milkweed, but the descriptions in the sacred text don't seem to fit in with the milkweed identification. From the ancient text it seems that this was a creeping plant which the Aryan invaders of India in 1000 BC brought down with them from Central Asia, and it became more and more difficult to get hold of the plant as they penetrated further and further into India. Philippe de Felice has a very interesting hypothesis about the development of Yoga (which evidently took place about this time, although it may have started earlier with the pre-Aryan people in India). The taking over of Yoga by the Aryan invaders may have been forced upon them by the fact that it was impossible for them to obtain supplies of soma so that, as they couldn't induce visions by biochemical means, they were forced to resort to purely psychological and breathing exercises to get to the same place. It is an interesting hypothesis which may perhaps be true. I don't know.

Then among the other drugs, which of course have been used in the past, are such extremely dangerous mind-changing drugs as opium and as coca, from which cocaine is derived, and such relatively dangerous drugs as hashish - and, after all, our dear old friend alcohol, which was used by the Greeks, later by the Persians, and used by the Celts in Europe as a mind-changing drug and worshipped as a god. This is the interesting thing: the substance which produces the change of mind is regarded as divine and is then hypostatized as a person projected into the external universe as a divine person. We get the same phenomenon in Central America where recently the archaeologists have dug up in the highlands of Guatemala a large number of small stone figures which represent mushrooms out of whose stem emerges the head of a god. It is a very significant fact that this mind-changing mushroom which, as we shall see in a moment, has now entered European life, was actually hypostatized as a deity.

The Mushroom Access. Among the more harmless mind-changing drugs used by people in their religious rites in the past are peyote, the Mexican cactus, which is used in the South-western states of America and over large parts of Mexico, then the Bannisteriopsis

caapi [harmine admixed with DMT-containing Psychotria viridis in the ayahuasca] of South America, and now of course the Mexico mushroom. In modern times pharmacology has produced, partly by more refined methods of extraction and partly by methods of synthesis, a number of mind-changing drugs of extraordinary power, but remarkable for the fact that they have very little harmful effect upon the body. Peyote, among the natural drugs, has almost no harmful effect upon the body; it is not addictive, and Indians 80 years old take no more of the drug than they did when they were young, nor do they feel any desire to take it more frequently than once every month or six weeks when the religious rites take place. The extract from peyote which is the active principle, and which is now synthesized, mescaline, has the same qualities. Among the more recent additions to the armamentarium of the pharmacologists, the psychopharmacologists, are LSD-25 (lysergic acid diethylamide) which was synthesized by Dr Albert Hofmann of Basel in 1943, and more recently psilocybin (about which we shall hear tonight, I hope, from Dr Leary) which was synthesized I think not more than 2 or 3 years ago, also by Dr Hofmann, who began by extracting the active principles of the Mexican mushroom which had been brought back by Professor Heim from his expedition to Mexico with Mr Gordon Wasson. I recently had the interesting experience of reading a letter which Professor Heim had written to my brother and which said, 'I have just come back from Mexico and as a great triumph I took with me a number of Hofmann's capsules of psilocybin and I gave a dose to the old lady - the curandera, the medicine woman - [Maria Sabina] with whom we had originally done our experiments with the mushrooms - and she was quite delighted because the effects were exactly the same as the mushrooms and she said, 'Now I can do my magic all the year round, I don't have to wait for the mushroom season!' So this perhaps is one of the great triumphs of modern science, that one of these days perhaps Professor Hofmann at Basel will receive a telegram saying, 'Please airmail one hundred capsules to Southern Mexico, have very important magic to perform next week' - and the capsules will go and the magic will be performed.

These biochemical methods are, I suppose, the most powerful and the most foolproof, so to say, of all the methods for transporting us to this other world that at present exist. I think, as Professor Leary will point out tonight, that there is here a very large field for systematic experimentation by psychologists' because it is now possible to explore areas of the mind at a minimum expense to the body, areas which were almost impossible to get at before, except either by the use of extremely dangerous drugs or else by looking around for the rather rare people who spontaneously can go into this world. (Of course it is very difficult for them to go in on demand, 'the Spirit bloweth where it listeth', we can never be sure that the people with the spontaneous gift of visionary experience will have it on demand.) With such drugs as psilocybin it is possible for the majority of people to go into this other world with very little trouble in and with almost no harm to themselves.

THE NATURE OF VISIONARY EXPERIENCE

Having discussed the means of access to this world of visionary experience, let me begin to talk about the nature of the world. What is the nature of visionary experience?

Light. *The highest common factor, I think' in all these experiences is the factor of light. There can be both negative, bad light' and good light. In Paradise Lost, Milton talks about the illumination of hell which he says is darkness visible. This I think is probably a very good psychological description of the kind of sinister light which sometimes visionaries do see, and it is a light which I think many schizophrenics see. In Dr Sechehaye's volume Journal d'une Schizophrène, her patient describes precisely this appalling light which she lives in: it is a kind of hellish light, it is a light like the glare inside a factory, the hideous glare of modern electric lighting gleaming upon machines. But on the other hand, those who go into a positive experience say this light is of incredible beauty and significance. The light experience on the positive side may be divided, I think into two main types. There is the experience of what may be called undifferentiated light, an experience just of light, of everything being flooded with light. And there is the experience of differentiated light, that is to say of objects, of people, of landscapes which seem to be impregnated and shining with their own light. In general I think it is possible to say that the experience of undifferentiated light tends to be the experience associated with the full-blown mystical experience. The mystical experience, I think, may be defined in a rather simple way as the experience in which the subject-object relationship is transcended, in which there is a sense of complete solidarity of the subject with other human beings and with the universe in general. There is also a sense of what may be called the ultimate All-Rightness of the universe, the fact that in spite of pain, in spite of death, in spite of all the horrors which go on all around us, this universe somehow is all right, and there is a direct understanding of such phrases as we find, for example, in the Book of Job, phrases which in our ordinary state we certainly cannot understand. I mean when Job says, 'Yea, though he slay me, yet will I trust in Him,' this is incomprehensible on our ordinary biological level, and yet it becomes perfectly comprehensible on the mystical level, even on the level of induced mysticism.*

Then there is another very characteristic psychological feature in the mystical experience: the sense of an intense gratitude, an intense gratitude for the privilege of being alive in a universe as extraordinary as this, as altogether wonderful. Here again one finds phrases in the mystical literature which are completely incomprehensible on the ordinary, everyday, biological level but which become completely comprehensible on the visionary and mystical level. For example, there is a phrase of William Blake's where he says 'Gratitude is Heaven itself.' What does this mean? It is very difficult to imagine in our ordinary state of mind, but it becomes perfectly clear in the induced or spontaneous mystical condition: gratitude is Heaven itself, gratitude is intense, and the actual experience of gratitude has an uplifting and joyous quality which is beyond all words.

The light experience is of course described again and again in all religious literature. After all, the most celebrated cases (the light experienced by Saint Paul on the road to Damascus; a tremendous explosion of light which woke Mohammed out of sleep which made him faint from its intensity; the experience of tremendous light which Plotinus described as having three or four times in his life) - you will find this again and again in literature. And don't let us imagine that these experiences of light are confined only to remarkable and outstanding men and women they are not. A great many quite ordinary people have had them, and this is one of the great merits of the most recent book by Professor Raynor C. Johnson, the book called 'Watcher on the Hills' where he brings together a great many case-histories of perfectly ordinary people who had this tremendous experience of undifferentiated light. If I may quote from a letter I received recently from an unknown correspondent - this is a woman in her sixties who wrote to me saying

that she had had an experience as a school-girl which had affected her throughout her life - she said, 'I was a girl of fifteen or sixteen, I was in the kitchen toasting bread for tea and suddenly in a dark November afternoon the whole place was flooded with light, and for a minute by clock time I was immersed in this, and I had a sense that in some unutterable way the universe was all right. This has affected me for the rest of my life, I have lost all fear of death, I have a passion for light, but I am in no way afraid of death, because this light experience has been a kind of conviction to me that everything is all right in some way.'

These experiences are relatively common; many more people have them than at present let on, I mean we live now in a period when people don't like to talk about these experiences. If you have these experiences, you keep your mouth shut for fear of being told to go to a psychoanalyst. In the past, when visions were regarded as creditable, people talked about them. They did run, of course, a considerable risk because most visions in the past were regarded as being inspired by the devil, but if you had the luck to convince your fellows that your visions were divine, then you achieved a great deal of credit. But now, as I say, the case has altered and people don't like talking about these things. This is the value, I think, of Professor Maslow's recent work on what he calls peak experiences. He is collecting a very large number of cases of this kind of experience, and he reassures his students that he is not going to regard them as crazy - they tell about these things, and he says it is surprising what a number of them do come out with the fact that they have had these kinds of experiences.

So much for the undifferentiated light, and here let me point out an interesting fact. I think one can say that in all the religions, both primitive and developed, light is the sort of predominant divine symbol, but the interesting fact is that this symbol is based upon a psychological fact, that the light of the world, the inner light, enlightenment, the clear light of the void in the Buddhist literature, all these are symbols. But they are also psychological facts. Just as the great metaphysical systems - so it seems to me - take their origin in many cases from psychological experiences, so again do we see these great primary symbols of religious life also take their origin from psychological experiences. This quasi-sensory experience of light is something which has run through many, I think one can say all, religions and has become, as I say, the primary symbol.

Now, from undifferentiated light we pass to differentiated light, that is to say, light contained in objects, shining out of things and people. Well, on its simplest level this is a kind of luminous living geometry. There is something rather interesting here. I think here again we can say that certain symbols are based on psychological facts. For example the mandalas of India, about which the late Dr Jung was so keen, these too are based I think on psychological facts. In what may be called the early stages of the visionary experience, people do see with the closed eyes things which are exactly like mandalas. These great symbolic constructs are again based upon immediate psychological experiences. Beyond these, of course, there are all kinds of more realistic, naturalistic visionary experiences - experiences of architectures' of landscapes, of figures. It is interesting to find that again and again in the accounts given by people of visionary experiences, we find the same elements described, for example, in Heinrich Klüver's book on peyote where he sums up most of the material which had been published up to the time he wrote it. We find again and again his description of luminous landscapes and architectures encrusted with gems. The doors and windows are surrounded by gems, the whole world of landscape is filled with what Ezekiel calls the stones of fire. These descriptions of course very closely parallel all the accounts of paradises, posthumous worlds and fairylands which are found in all the traditions of the world. We shall go into this further later, but I think it is important to point out that here again there is a psychological basis to a great deal of material which is to be found in the traditional literature of religion and folklore.

Visiary Figures. We come now to the visionary figures. These also occur, and here again there is a very curious and interesting fact which has been recorded again and again in the literature both of spontaneous experiences and induced experiences, that when a figure is seen, it virtually never has a face which we recognize. Our fathers and mothers and wives and children do not appear. What we see is a complete stranger. Here again I think this fact accounts for some interesting theological speculations. For example, angels are not, as now theoretically supposed, the departed spirits of the dead; they belong to another species altogether. This exactly confirms what the psychologists have found in relation to induced or spontaneous experiences; these are always figures of strangers.

When one starts to think about the neurology and the psychology of this state of affairs, it is most extraordinary that there is something in our brain/mind, some part of our brain/mind, which uses the memories of visual experiences and recombines them in such a way as to present to the consciousness something absolutely novel, which has nothing to do with our private life and very little to do, as far as one can see, with the life of humans in general. Personally I find it extremely comforting to something I have somewhere at the back of my skull something which is absolutely indifferent to me and even absolutely indifferent to the human race. I think this is something very satisfying, that there is an area of the mind which doesn't care about what I am doing, but which is concerned with something quite, quite different. And why this should be and what the neurological basis be I cannot imagine, but this is something which I think requires investigation.

Transfigurations. Now we come to another aspect of differentiated light which may be described as the spilling out from the interior world into the exterior world. There is a kind of visionary experience which people have with the eyes open and which consists in a transfiguration of the external world so that it seems overwhelmingly beautiful and alive and shining. This of course is what Wordsworth described so beautifully and so accurately in his great Ode on the Intimations of Immortality, and similar experiences can be found in the works of the mystics, in the work of the Anglican mystic, Traherne, who gives an incredibly beautiful description of the kind of transfigured world in which he lived in childhood. This description ends up with the most beautiful passage where he describes this wonderful world, and he says, 'And so with much ado I was taught the dirty devices of the world which now I unlearn and become as a little child again so that I now enter once more the Kingdom of God.' And here, as I said before, here is surely one of the great challenges to modern education: How do we keep alive this world of immense value which people have had during childhood and which certain privileged people retain throughout their lives? How do we keep this alive and at the same time impart

a sufficient amount of conceptual education to make them efficient citizens and scientists? This I don't know, but I am absolutely certain that this is one of the important challenges confronting modern education.

This transfigured external vision is very important in relation to art. By no means is all art visionary art; there is wonderful art which is essentially not visionary art. But there is also wonderful art which is essentially visionary art, which is the product either of the artist's vision, so to say with the eyes closed, of what is happening inside his head, this extraordinary other world; or else a vision of the external world transfigured either for the good or for the evil. In the works of Van Gogh, for example, one can find extraordinary examples of both negative and positive transfiguration.

VISIONARY EXPERIENCE IN RELIGION AND FOLKLORE

Now very briefly let us touch on some of the significances of visionary experience for religion and folklore. One finds, in all the traditions, descriptions of paradise, of the golden age, of the future life, which one places side by side with the descriptions of visionary experience, either spontaneous or induced, and sees that they are exactly the same; that the world described in popular religion, these other worlds, are simply descriptions of visionary experiences that men have projected from the inside into the universe. In all the traditions we find the same confusion of gems, and where gems are not used we find glass which, of course, was regarded as a very precious and strange material in the past! We find this in the Book of Revelation, a sea of glass in the New Jerusalem, the walls of which were gold and yet transparent, a kind of gold and transparent glass, and we find the same emphasis on glass as a marvellous magical material in the Northern traditions. We find it in the Celtic tradition, in the Welsh tradition; for example the home of the dead is called Ynisvitrin, the Isle of Glass, and in the Teutonic tradition the dead live in a place called Glasberg, the mountain of glass. And it is most curious to find, from Japan to Western Europe, these same images coming through again and again, showing how universal and how uniform this kind of visionary experience has been and how it has constantly been regarded as of immense importance and has been projected out into the cosmos in the various religious traditions.

THE VALUE OF VISIONARY EXPERIENCE

I suppose in a certain sense one can say the value is absolute. In a sense one can say that visionary experience is, so to say, a manifestation simultaneously of the beautiful and the true, of intense beauty and intense reality, and as such it doesn't have to be justified in any other way. After all, the Good, the True and the Beautiful are absolute values, and in a certain sense one can say that visionary experience has always been regarded as an absolute value, that it has been always felt to be intrinsically of immense significance and importance and worth having at a very great price. But it is also important to point out that, although they are in some sense intrinsically valuable and in some sense absolutely valuable, yet I think we can speak about visionary experiences in terms of their value within the frame of reference of goodness and spirituality. In this context I think it is very important to think of the theological definition of such experiences. The theological definition of a vision or even of a spontaneous mystical experience is 'a gratuitous grace'. These things are graces, they are given to us, we don't work for them. They come to us and they are gratuitous, which means to say that they are neither necessary nor significant for salvation or for enlightenment, whatever you like to call it. But if they are properly used, if they are cooperated with, if the memory of them is felt to be important and people work along the lines laid down during the vision, then they can be of immense value to us and of great importance in changing our lives. This idea of the gratuitous grace which takes on importance if we cooperate with it, is very significant in all the range of visionary experience, both spontaneous and induced.

We shall hear from Leary about the induction of such experiences by such substances as psilocybin, and I would certainly say that this kind of induced experience may be of no value at all, it may be like just going to the movies and seeing an interesting film. Or on the contrary, if it is cooperated with, if we perceive it has some sort of deep significance and we do something about it, then it may be very, very important in changing our lives, changing our mode of consciousness, perceiving that there are other ways of looking at the world than the ordinary utilitarian manner, and it may also result in significant changes of behaviour. We of course now come to the philosophical problem: what is the metaphysical status of visions, what is the ontological status? Well, fortunately, this is a Congress of Applied Psychology, we don't have to go into this kind of problem, though I think it is worth going into, and I hope somebody will go into it sooner or later. But for the time being we can say, I think, that the value, apart from their intrinsic value, so to say the ethical, sociological and spiritual value of the visionary experience, is that if it is well used, it can result in a significant and important change in the mode of consciousness and perhaps also in a change in behaviour for the good.

The Most Beautiful Death: Huxley's Death on LSD as described first-hand by his wife Laura Letters of Note.

I don't know exactly what time it was, he asked for his tablet and wrote, "Try LSD 100 intramuscular." Although as you see from this photostatic copy it is not very clear, I know that this is what he meant. I asked him to confirm it. Suddenly something became very clear to me. I knew that we were together again after this torturous talking of the last two months. I knew then, I knew what was to be done. I went quickly into the cupboard in the other room where Dr. Bernstein was, and the TV which had just announced the shooting of Kennedy. I took the LSD and said, "I am going to give him a shot of LSD, he asked for it." The doctor had a moment of agitation because you know very well the uneasiness about this drug in the medical mind. Then he said, "All right, at this point what is the difference." Whatever he had said, no "authority," not even an army of authorities could have stopped me then. I went into Aldous' room with the vial of LSD and prepared a syringe. The doctor asked me if I wanted him to give him the shot – maybe because he saw that my hands were trembling. His asking me that made me conscious of my hands, and I said, "No I must do this." I quieted myself, and when I gave him the shot my hands were very firm. Then, somehow, a great relief came to us both. I believe it was 11:20 when I gave him his first shot of 100 microgrammes. I sat near his bed and I said, "Darling, maybe in a little while I will take it with you. Would you like me to take it also in a little while?" I said a little while because I had no idea of when I should or could take it, in fact I have not been able to take it to this writing because of the condition around me. And he indicated "yes." We must keep in mind

that by now he was speaking very, very little. Then I said, "Would you like Matthew to take it with you also? And he said, "Yes." "What about Ellen?" He said, "Yes." Then I mentioned two or three people who had been working with LSD and he said, "No, no, basta, basta." Then I said, "What about Jinny?" And he said, "Yes," with emphasis. Then we were quiet. I just sat there without speaking for a while. Aldous was not so agitated physically. He seemed – somehow I felt he knew, we both knew what we were doing, and this has always been a great relief to Aldous. I have seen him at times during his illness very upset until he knew what he was going to do, then even if it was an operation or X-ray, he would make a total change. This enormous feeling of relief would come to him, and he wouldn't be worried at all about it, he would say let's do it, and we would go to it and he was like a liberated man. And now I had the same feeling – a decision had been made, he made the decision again very quickly. Suddenly he had accepted the fact of death; he had taken this moksha medicine in which he believed. He was doing what he had written in ISLAND, and I had the feeling that he was interested and relieved and quiet.

After half an hour, the expression on his face began to change a little, and I asked him if he felt the effect of LSD, and he indicated no. Yet, I think that a something had taken place already. This was one of Aldous' characteristics. He would always delay acknowledging the effect of any medicine, even when the effect was quite certainly there, unless the effect was very, very strong he would say no. Now, the expression of his face was beginning to look as it did every time that he had the moksha medicine, when this immense expression of complete bliss and love would come over him. This was not the case now, but there was a change in comparison to what his face had been two hours ago. I let another half hour pass, and then I decided to give him another 100 mg. I told him I was going to do it, and he acquiesced. I gave him another shot, and then I began to talk to him. He was very quiet now; he was very quiet and his legs were getting colder; higher and higher I could see purple areas of cyanosis. Then I began to talk to him, saying, "Light and free," Some of these thing I told him at night in these last few weeks before he would go to sleep, and now I said it more convincingly, more intensely – "go, go, let go, darling; forward and up. You are going forward and up; you are going towards the light. Willing and consciously you are going, willingly and consciously, and you are doing this beautifully; you are doing this so beautifully – you are going towards the light; you are going towards a greater love; you are going forward and up. It is so easy; it is so beautiful. You are doing it so beautifully, so easily. Light and free. Forward and up. You are going towards Maria's love with my love. You are going towards a greater love than you have ever known. You are going towards the best, the greatest love, and it is easy, it is so easy, and you are doing it so beautifully." I believe I started to talk to him – it must have been about one or two o'clock. It was very difficult for me to keep track of time. The nurse was in the room and Rosalind and Jinny and two doctors – Dr. Knight and Dr. Cutler. They were sort of far away from the bed. I was very, very near his ears, and I hope I spoke clearly and understandingly. Once I asked him, "Do you hear me?" He squeezed my hand. He was hearing me. I was tempted to ask more questions, but in the morning he had begged me not to ask any more question, and the entire feeling was that things were right. I didn't dare to inquire, to disturb, and that was the only question that I asked, "Do you hear me?" Maybe I should have asked more questions, but I didn't.

Later on I asked the same question, but the hand didn't move any more. Now from two o'clock until the time he died, which was five-twenty, there was complete peace except for once. That must have been about three-thirty or four, when I saw the beginning of struggle in his lower lip. His lower lip began to move as if it were going to be a struggle for air. Then I gave the direction even more forcefully. "It is easy, and you are doing this beautifully and willingly and consciously, in full awareness, in full awareness, darling, you are going towards the light." I repeated these or similar words for the last three or four hours. Once in a while my own emotion would overcome me, but if it did I immediately would leave the bed for two or three minutes, and would come back only when I could dismiss my emotion. The twitching of the lower lip lasted only a little bit, and it seemed to respond completely to what I was saying. "Easy, easy, and you are doing this willingly and consciously and beautifully – going forward and up, light and free, forward and up towards the light, into the light, into complete love." The twitching stopped, the breathing became slower and slower, and there was absolutely not the slightest indication of contraction, of struggle. it was just that the breathing became slower – and slower – and slower, and at five-twenty the breathing stopped.

I had been warned in the morning that there might be some upsetting convulsions towards the end, or some sort of contraction of the lungs, and noises. People had been trying to prepare me for some horrible physical reaction that would probably occur. None of this happened, actually the ceasing of the breathing was not a drama at all, because it was done so slowly, so gently, like a piece of music just finishing. There was not the feeling that with the last breath, the spirit left. It had just been gently leaving for the last four hours. In the room the last four hours were two doctors, Jinny, the nurse, Rosalind Roger Gopal – you know she is the great friend of Krishnamurti, and the directress of the school in Ojai for which Aldous did so much. They didn't seem to hear what I was saying. I thought I was speaking loud enough, but they said they didn't hear it. Rosalind and Jinny once in a while came near the bed and held Aldous' hand. These five people all said that this was the most serene, the most beautiful death. Both doctors and nurse said they had never seen a person in similar physical condition going off so completely without pain and without struggle. We will never know if all this is only our wishful thinking, or if it is real, but certainly all outward signs and the inner feeling gave indication that it was beautiful and peaceful and easy.

And now, after I have been alone these few days, and less bombarded by other people's feelings, the meaning of this last day becomes clearer and clearer to me and more and more important. Aldous was, I think (and certainly I am) appalled at the fact that what he wrote in ISLAND was not taken seriously. It was treated as a work of science fiction, when it was not fiction because each one of the ways of living he described in ISLAND was not a product of his fantasy, but something that had been tried in one place or another and some of them in our own everyday life. If the way Aldous died were known, it might awaken people to the awareness that not only this, but many other facts described in ISLAND are possible here and now. Aldous' asking for moksha medicine while dying is a confirmation of his work, and as such is of importance not only to us, but to the world. It is true we will have some people saying that he was a drug addict all his life and that he ended as one, but it is history that Huxleys stop ignorance before ignorance can stop Huxleys.

Epilogue

Symbiotic Existential Cosmology is Pandora's Pithos⁹⁴ Reopened and Shekhinah's Wings returning to Bless the Earth with Abundance.

Fig 263: Elpis the spirit, or goddess of Hope, who remained caught under the lip of Pandora's jar according to the will of Zeus, depicted as an adolescent girl, wearing adult dress for the first time, hitching her skirt to keep it from dragging, holding a flower, or sometimes a bird to emphasise the fresh hope of spring and new growth. (Roman coin to Spes or Elpis The reverse of a potin tetradrachm of Carinus 285 AD showing Elpis).

Causing a paradigm shift is literally opening Pandora's Box with potentially devastating consequences if it takes off. We are, whether we like it or not, living in an age of information. This means that the mere fact that Symbiotic Existential Cosmology now exists as a work on multiple platforms means that Pandora's Pithos has again been opened. Troubled by the death curse of the Box, I discovered today as I write, another charming karmic echo from history, dating from around 750 BC caught in our entanglement. This time opening the Pithos reveals Elpis – literally the youthful female spirit of Hope or Expectation – the one remaining spirit kept in the jar has now escaped into the world and the consequences are ensuing, however gradually. The arrow of time means this information flows on out into the world and irreversibly changes the situation for the good, whatever we do next.

The only way this could fail is if there were a critical flaw, which would mean that scientists and clerics could breathe a sigh of satisfaction, that yet another hopeful monster has turned into a mutant ninja turtle and that the interlocutor is just a pretentious deluded upstart at the age of 77. But that is unlikely, as Symbiotic Existential Cosmology agrees with quantum cosmology and empirical neuroscience and invokes the foundations spirituality in conscious human agency. For the first months I aimed high, seeking such criticism with hopes that astute people, particularly research scientists in psychedelics and related fields of consciousness and philosophy would find this discovery as utterly exciting as I did, but I was faced with a deafening silence.

Not one reply from anyone! My friends shunned me, academics whose opinion I valued refused to reply at all. Only two people fully responded. A math colleague, who read the first vestigial manuscripts and another friend who did likewise, both of whom gave commonsense encouragement, particularly on the basis that the world is in existential crisis. This led to ongoing angst. Some of the psychedelic scientists claimed the hard problem of consciousness was not even a scientific question and that psychedelics could only solve the easy problems. When I tried to point out that a magic mushroom experience had solved it in a panpsychic cosmology, I got nowhere with either scientists or philosophers, and simply ended up in a stand-off, when I critiqued their position in an open letter.

Over the ensuing months, I continued feverish writing, and Symbiotic Existential Cosmology blossomed into an impenetrable verdant thicket, spanning ethnic animism, religious exegesis, consciousness research, molecular biogenesis, psychedelic neuroscience, quantum cosmology, panpsychist philosophy, an evolutionary analysis of how consciousness as we know it emerged, and how neurotransmitters, such as serotonin play a central role in evolving brain development going back to social amoebae. The final denouement was that our empirically experienced subjective conscious volition over the physical universe alone reverses the implications of materialism, to invoke a complementary description of mental and physical reality. It is no longer just a psychedelic vision, subject to the Achilles heel of prejudice, but the irrefutable truth of volition itself, as accepted in intent and responsibility in law and in every intentional act we perform, that now underpins this revelation.

Later in conversation with a group of spiritually- minded scientists, I realised that I had to include the full sweep of the extended evolutionary synthesis to establish the cultural evolutionary phase leading to crisis and to parry false religious claims against natural evolution that is the foundation of the immortal tree of living diversity, and so the 100 page section on evolution was born, taking the monograph to a book length 400 pages.

⁹⁴ According to Hesiod, when Prometheus (fore-sight) stole fire from heaven, Zeus, the king of the gods, took vengeance by presenting Pandora to Prometheus' brother Epimetheus (hind-sight). Either Pandora or Epimetheus opened the jar left in her care containing sickness, death and many other unspecified evils which were then released into the world, or the lost blessings of the Gods as the other story goes. Though she hastened to close the container, only one thing was left behind – usually translated as Hope.

So for me, Symbiotic Existential Cosmology has become more than a just fortuitous mushroom trip. It is the Rosetta stone of reality that is already here in the world. It is a difficult, inscrutable work in scripture intended to be complete and definitive enough to last a billion years, provided humanity continues to survive and evolve, that also tells the first-person account of how an individual, facing the planetary apocalypse that had been created both by ancient religions and materialistic ennui, found himself caught in an uncanny quantum instance that made it possible to traverse the same unlikely portal defining history that had happened 2000 years before, to reveal the weltanschauung of immortality, unravelling the human zeitgeist towards a new symbiotic paradigm of organic and technological coexistence with nature and life as a whole.

It is not just a hypothetical theory that can be taken at face value or discarded at will, but four things: (1) Objective quantum cosmology invoking biogenesis and climax biodiversity, augmented by (2) Darwinian panpsychism and (3) cosmological symbiosis. Point (2) then invokes a subjective veridical transaction of mutual trust between conscious agents that we have subjective volitional will over the physical universe, inheriting the responsibility to protect conscious life as a whole, in the symbiotic climax invoked by (3). Finally it is (4) a complete confession of everything of significance I have said, been or done to this end, naked and unashamed in my singular quest to wreak salvation on a troubled world, my vigils to far flung corners of the Earth and the antipodean outlandishness of declaring the end of the Apocalyptic Epoch in the Holy City, so that we can now keep the way of the Tree of Life throughout our generations forever, as it was in the very beginning, as has likewise, from the outset, been stated on the closing page:

*"Have you discovered, then, the beginning, that you look for the end?
For where the beginning is, there will the end be"*
(Gospel of Thomas 18).

The cosmology is already out there! It can't be undone! It's not a grand, or petite delusion, but the redemption of life in complete transparency. So while I seek your support to help convey this crazy message that no one wants to hear or accept, I know underneath that root paradigm shifts have a long latency, and that SEC is cosmologically valid and empirically sound. Simply by convening the group, I made you all aware of this, so you are all now fully cognisant and complicit. My work is fulfilled and it is over to all of us, because we are all in possession of this fatal carnal knowledge, which can never be undone! The diversity of life still needs us and needs us now. So as the Talmudic statement said, "**we** are not obligated to complete the work, but neither are **we** free to abandon it."

Our involvement is now a question of taking advantage of what is already revealed, from which the lioness on the cover has already sprung anew, to accelerate the process of protecting the diversity of life. In return, I vouchsafe to protect you all and support your own inspirations of renewal.

If you look carefully at the last few lines of the text in figure 259, which gives my veridical account of the initial experience, written the same evening, you will see that I had already abdicated my responsibilities on the first night, passing all the onus onto the sacrament itself to escape the messianic tradition, in an affirmation from scriptural history!

*"I am not your master. Because you have drunk, you have become intoxicated
from the bubbling spring which I have measured out."* (Gospel of Thomas 13)

My role now, as a chaotic dynamicist is oddly enough, to make sure this process doesn't become unhinged, although I'm not forsaking the lionesses claws on the Symbiotic Existential Cosmology cover until I see some signs of cooperative progress for biodiversity, so will turn the tables and create dissension if need be – to guard the beacon light of resplendence, so it can shine brightly, rather than "cast fire on the world", as Yeshua did, which would just lead to apocalyptic climate crisis and deforestation, as we know.

Recall this whole phenomenon arose from my long-sightedness, causing acute glaucoma, which first delayed and then precipitated this entire phenomenon. So Symbiotic Existential Cosmology was clearly Promethean foresight and not the unfortunate Epimethean hindsight that opened Pandora's pithos in the first place.

Uziel Awret: I imagine we are as insistent as you about the fundamentality of the preservation of life and our debt to the future. In the end it's a question of understanding the nature of this responsibility. In the Jewish spiritual tradition this responsibility is not just the responsibility of Tikun aiming to preserve life (precisely to achieve the conditions that would make your utopia possible) but also a responsibility to a reconstitution of a God that 'sacrificed itself' (the

vessels of light breaking into a myriad of shards), or a singularity that exploded, and that depends on us for its reconstitution and the reuniting the shards. In this cosmology or, mythology, the appearance of man signifies a special point on the road of Tikun where for the first time a self representing universe (in which even a bacteria mapping its environment is a way in which 'the universe observes itself', see PGS on Awakening) manages to capture its singular nature. Here the primordial singularity can only be 'captured' by another singularity. It is said in the Haggada (quoted by Prigogine) that God has created the world 27 times and that this is the 27th. Each time God says – Halevai Sheyamod' – i.e. 'Hope this one survives'. While fragile, these worlds are saturated with hope.

Chris King: Symbiotic Existential Cosmology is not a utopia, whose aim is seeking "perfection in legal, social, and political systems" whose meaning is "nowhere" from Greek *ou* "not" + *topos* "place". It is the actual, cosmology of the conscious universe. I am not asking for a religious or spiritual movement to save biodiversity as a utopian quest. I simply seek ground zero recognition of, and action upon, the real existential threats to our survival, without which the meaning of life has no meaning. From this all these other utopian and spiritual quests flow.

The purpose of Symbiotic Existential Cosmology is to establish that human symbiosis with the biosphere in evolutionary time scales is the sine qua non necessary reality in the living universe in which we consciously exist. It doesn't present any spiritual point of view except for loving reverence for life itself as the climax process through which the universe becomes fully manifest, and the ability to experience ultimate reality in the first person with no a priori assumptions.

It might seem to others that Symbiotic Existential Cosmology is some kind of shamanic utopian quest for a lotus-eating culture based on mushroom mysticism, but since it has no spiritual doctrine, apart from first person experience of natural existence, it has no cultic status. It's not for me to advance mushroom mysticism, it's simply a scientific fact of biospheric evolution confirmed in multiple research studies. SEC's case rests entirely on its veracity as the correct description of the cosmological context in which our conscious lives are embedded.

You have introduced charming tales of the fragility of the many universes evoked by divinity that I love, as I love many diverse aspects of the "mother religion" from the Zohar to the Torah, but the key point about all these descriptions, particularly the Sabbatical Creation, that becomes the Achilles heel of creationism, is that they are allegories of the ephemeral world human imagination evokes about the cosmos. Humanity has spun creation myths since the dawn of history but these are allegories of an ephemeral so-called "divine" realm not having the veridical flesh and blood reality of nature in the raw. They are hypothetical, but biological survival is actual.

The Shekhinah of Jewish mythology, represents the indwelling feminine face of God's presence on Earth in matrimonial concord, in the tent of Sarah, and in the Eagle's wings, also carrying the pregnant madonna into the wilderness in Revelation and the Matrona that keeps the way of the Tree of Life:

The Shechinah is defined, in traditional Jewish writings, as the "female aspect of God" or the "presence" of the infinite God in the world. She is introduced in the early rabbinical commentaries as the "immanence" or "indwelling" of the living God, whose role as the animating life force of the earth is to balance the transcendent deity (Novick 1983).

We are taught that Abraham and Sarah initiated souls by bringing them "under the wings of Shekhinah" (Novick 2008).

The Shekhinah was said to have retreated in the Fall in Eden and will return in the End of Days unveiling as sparks or shards that will come together in reunion in completing the mosaic of the shattered feminine.

Fig 264: Shekhinah and the Tree of Life

So I want to give you my interpretation of this. We spent most of our time in Jerusalem in the millennium discussing this and related ideas. The Shekhinah is one of the most misperceived entities in spiritual, let alone Jewish, cosmology. As described in the Kabbalah, she is the feminine face finessed into a patriarchal mould. This confuses the entire nature of the God quest. The key thing is that the Shekhinah became fractured in the Fall and the End of Days is her reuniting. This turns the tables on the entire apocalyptic reality. This is not just a spiritual singularity capture. It is the feminine face regaining her rightful sanctity in the patriarchally imbalanced top-heavy cosmology.

The Fall was Yahweh's fall from the grace of unity that was expressed in Adam and Lilith as contesting equals, before Eve was made a surrogate wife in the patriarchal mould and then cursed to be the mother of all living under travail pain of childbirth and obedient to her husband, as man was to be to Yahweh:

After God created Adam, who was alone, He said, "It is not good for man to be alone." He then created a woman for Adam, from the earth, as He had created Adam himself, and called her Lilith. Adam and Lilith immediately began to fight. She said, "I will not lie below," and he said, "I will not lie beneath you, but only on top. For you are fit only to be in the bottom position, while I am to be the superior one." Lilith responded, "We are equal to each other inasmuch as we were both created from the earth." But they would not listen to one another. When Lilith saw this, she pronounced the Ineffable Name and flew away into the air (Alphabet of ben Sirach).

According to Midrash, the Genesis Rabbah states: "God proceeded to create a second Eve for Adam, after 'the first Eve' (Chavvah ha-Rishonah) had to return to dust". And in the Numbers Rabbah: "My firstborn, He is now destroying! As that Lilith who, when she finds nothing else, turns upon her own children". Lilith retreated into the wilderness and came to be demonised as a hyper-fecund destroyer of children, particularly male infants, in resentment over her displaced heritage (Plaskow 2005).

Wildcats shall meet with hyenas, goat-demons shall call to each other; there too Lilith shall repose, and find a place to rest. There shall the owl nest and lay and hatch and brood in its shadow (Isa 34:14).

The ultimate sin of God was withholding the Tree of Life hidden since the foundation of the world, so that the sanctity of nature and the creative process of natural evolution became repressed and female reproductive choice became oppressed. There is no way this can be addressed by trying to balance reverence for life against reuniting God. Yahweh has sinned against nature and the feminine and this is what needs reunification.

Now, what is "the way of the Tree of Life"? This is the great Matrona who is the way to the great and mighty Tree of Life ... is the Shekhinah (Soncino Zohar, Shemoth).

To give the traditional underpinnings of this account in the Kabbala, here is a short excerpt from Schwartz (1997) concerning an account of Isaac Luria – "Ha'ARI" ("The Lion") after Rabbi Abraham sent by Ari had in "A vision at the Wailing Wall (Kotel)".

Ari had touched the forehead of Rabbi Abraham and sensed he might face immanent demise and said to go to Jerusalem to pray at the Kotel for the Shekhinah to appear. He did so and saw a woman in mourning, and when he stared into her eyes he felt sadness and grief so great that he had never felt before, as it was the pain of a mother who felt sympathy for her children in banishment. He fainted and fell on the ground and experienced a second vision of Shekhinah as a beautiful woman in a wedding gown. She embraced him and whispered in his ear: "Do not worry, Abraham, my son. My banishment shall soon come to an end, and my legacy will not be for naught, as it is said: There is hope for your future and your children will return to their own territory, thus retelling the Rabbinical tale of the Shekhinah's exile and return in the reintegration of Israel, the rebuilding of the Temple and the coming of the Messiah:

The two appearances of the Shekhinah that Rabbi Abraham envisions at the Wall, that of the old woman in mourning and of the bride in white, represent the two primary aspects of her nature, one grieving over the destruction of the Temple and the exile of Israel, and other representing the ecstatic feminine, as symbolized by a celestial bride. Indeed, these multiple faces suggest that the figure of the Shekhinah contains within it a host of other goddess figures, all of which have been subsumed in one mythic figure.

Its central teachings concern the mysteries of creation: How God had to contract Himself in order to make space for the creation of the world, in a process known as Simsum. How God then sent forth vessels of primordial light that somehow split apart, scattering the sparks of holy light all over the world, but especially in the Holy Land. And how gathering these sparks can restore the broken vessels, returning the world to its primordial condition.

The deepest mystery of all among the students of Isaac Luria – the Ari concerns the true reason for the Shattering of the Vessels. The most important consequences of it, however, are apparent: it shifts the responsibility for the fallen state of existence from man to God, and it also sets the stage for the second phase of the myth, that of the Gathering the Sparks. Here the scattered sparks are sought out and gathered in the belief that when enough have been raised up, the broken vessels will be restored and the world returned to its prelapsarian state.

The most essential feature of the Ari's myth is its two-part nature. Here it is understood from the first that the complete myth requires both parts; it is not possible to consider one without the other. The first part of this cosmological myth is destructive, the second part creative. The archetypal pattern is that of shattering and restoration. But instead of shifting the blame for the Fall to

Adam and Eve, here it can be directly linked to God, Who, after all, is the ultimate creator and therefore responsible for any flaws in creation.

Note the remarkable parallels between the Ari's creation myth and that of the Exile of the Shekhinah. Both are two-part; both involve separation and reunion, exile and return; both attribute to the prayers of Israel the power to accomplish the necessary tikkun or repair. Indeed, it is possible to view the myth of the Ari as a mystical restatement of the Exile of the Shekhinah.

Thus the kabbalists did as the rabbis had before them: they received one myth and transformed it into another, which more closely mirrored their view of the world. For them this meant resurrecting the lost goddess, but doing so in a context that appeared to preserve the monotheistic basis of Judaism. So it is that the myths about God, the Bride of God, and the Messiah converge, diverge, and ultimately come together in the messianic vision of the End of Days. For when all of the holy sparks have been liberated, the Messiah will come, the Temple will be restored, and God's Bride will come out of exile, restoring the Godhead to wholeness.

If we are talking in the messianic paradigm, as I do to fulfil my covenant, I am here, born into this world, to reflower the Tree of Life in the sacred hieros gamos of nature and divinity in that of woman and man reunited and women's sovereignty again becoming sacrosanct. To do this I have to coalesce the shards, but do it in a way that is not simply another utopian religious movement. Hence I chose the vehicle of a cosmology, because cosmology is the way science sees the cosmos and this is the way the whole tragedy can be undone.

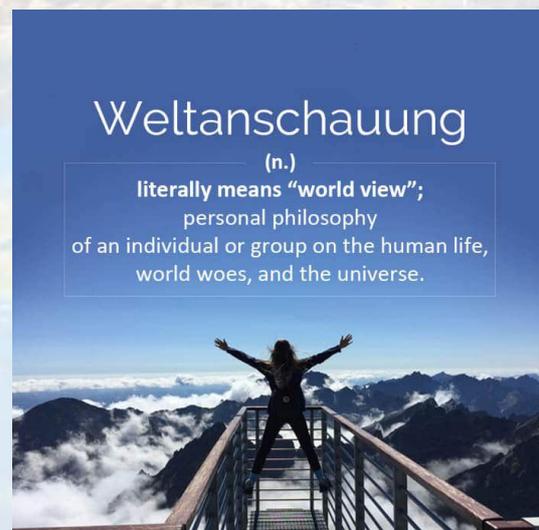

When I say it is necessary and imperative to make the existential threat of the mass extinction of life the sine qua non objective over spirituality, I am doing so as the messiah of the immortal age of the living tree of existence, in which the feminine element compensating God's original sin is nature herself and the primacy of symbiosis IS the reunion manifest. This can't be a utopia, or we will just go down the same route. It HAS to be the cosmology of the reflowering of the Tree of Life.

Out there there are actually still forests and jungles with wild animals and nutritive, medicinal and poisonous species which are not ephemeral unless we wreak annihilation upon life as a whole as we appear to be doing, but these are lying far beyond the technological machine-dependent culture of our increasingly urban society, which the majority of humanity, receding into urban concrete jungles, no longer recognises as motivating, perhaps beautiful, although somewhat threatening and certainly not essential to our fantasies of progress, from science-fiction utopias, to the noosphere, where as we know to our peril, thought seeks to supplant the necessity of evolving nature.

This is a recipe for disaster that can't be put on the back burner. It is NOT apocalyptic thinking to recognise this. It is the true Unveiling, and an eschatological death wish to ignore it!

The Weltanschauung of Immortality

The Weltanschauung⁹⁵ of Immortality is the world view in which life and conscious existence are recognised as perennially immortal processes key to the cosmology of the universe and that the meaning and reason for conscious existence is the sacred process of fulfilment of the flowering of life, so that the universe as a whole can become fully aware of and truly know itself through the living biota it has generated as a climax phenomenon. This point of view is both intuitively natural to human emergence in animism and transcends both the materialistic and theistic world views, each of which is degenerate, incomplete, confining and corrupt. It fulfils our existential hope in a way which neither

⁹⁵ **Weltanschauung** is used as an English word, from the German because the English *worldview* is too vague and not comprehensive enough. (For *anschauen* = to look at, rather with the meaning "to take a good look at", for *schau* = to show, display, as opposed to *blicken* = to look, or *aussehen* from *sehen* = to see). Primarily it means a way a person looks at the phenomenon of life as a whole. Some people (particularly those who have not lived very long) have not formed any broad (inclusive, even "sophisticated") view of life. Others consider a large number of factors before forming their overall view — maybe in their seventies — of the phenomenon of human existence. Typically a person's Weltanschauung would include a person's philosophic, moral, and religious conclusions — including e.g. the duality of spirit and matter — and perhaps their conclusions about the origins of the universe and of the development of life.

theism not materialism can do and places us as active, pivotal and responsible cosmological agents in the flowering and unfolding of conscious existence.

The paradox of the existential condition, amid an entropic universe is fundamental to cosmology. A symmetry-breaking has to occur, in which positive energy real particles inherit the arrow of time, amid a time-symmetric underlying milieu of quantum potentialities. From this symmetry-breaking, the second law of thermodynamics follows, in which isolated systems tend to a 'randomised' state of increasing entropy by mutual interaction, as the ultimate doom of annihilation of structure and meaning.

Molecular biogenesis and the ensuing evolution of life is a negentropic process of increasing complexity, that runs upstream against the entropic current of 'despair', because it is an open thermodynamic system on a planetary surface basking in gentle incident solar radiation of a wavelength spectrum that can be absorbed by the molecular systems of living cells without so degrading them that life is wiped out. We thus arrive at planetary biospheres where life beats the entropic odds and rises to a climax of species complexity and diversity and becomes conscious of itself.

Life in the universe rises to conscious climax through perennial species immortality, but it occurs inevitably coupled to organismic mortal sexuality. This is the dilemma of the mortal coil and is precisely the way it has to be, because the molecular genetic basis of life is always subject to mutational degradation by Muller's ratchet, the entropic randomisation of any structured genome bit by bit in the absence of active processes of genetic recombination to add vital new genetic combinations to restore life's genetic vitality.

Bacteria and archaea solve this problem by co-existing symbiotically with transposable elements and viruses that promiscuously exchange genetic sequences, even between differing species, in horizontal gene transfer. Complex organisms evolved through the endo-symbiosis between the archaea and bacteria giving rise to our respiring mitochondria giving rise to the first eucaryotes. Without this symbiosis complex life could not have arisen. The energy provided by this cooperative fusion provided the basis for a tremendously expanded genetic and phenotypic complexity and the large genomes of nucleated eucaryote cells, but with this complexity came crippling attrition from mutational degradation, despite the evolution of the error-correcting enzymes that ensure human longevity.

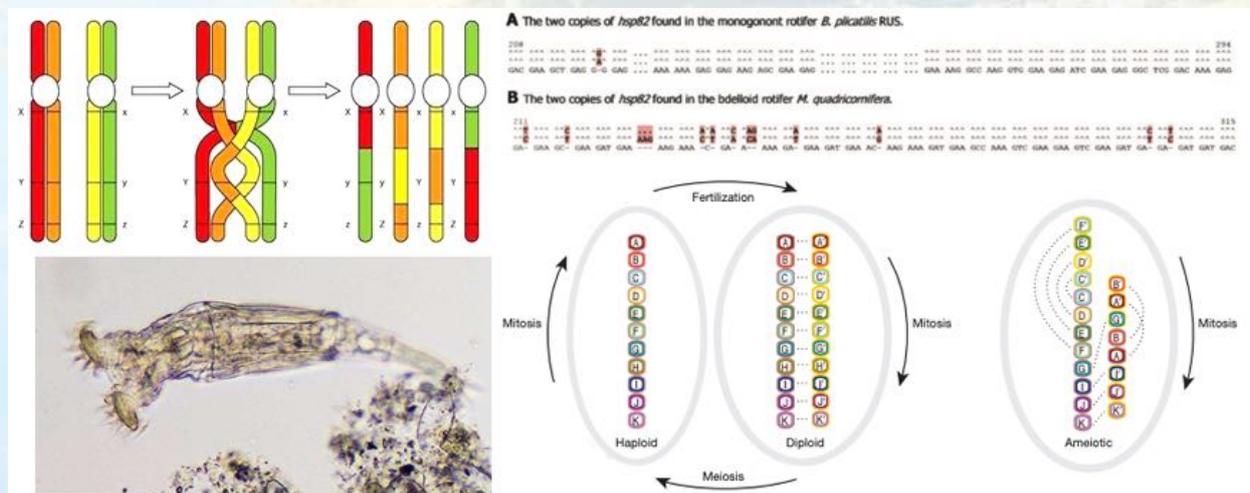

Fig 265: Meiotic crossing over (top left) in eucaryote haploid-diploid sexuality has sustained the diversity and evolution of eucaryote life forms from mutational degradation for the last 2 billion years resulting in unique mortal individuals of each sex while species as a whole are perennially immortal. A number of species, from lizards to aphids, can generate young by parthenogenesis, but all species resort to occasional cryptic sexual recombination to refresh their genomes, except for the bdelloid rotifers whose genomes, unlike those of sexual rotifers (top right) are densely packed with allele differences, indicating their diploid chromosomes are no longer able to cross over and have diverged asexually for up to 40 million years. However, bdelloid rotifers have been found to have another primitive form of genetic recombination like prokaryotes by scavenging the genes of sexual rotifers or other organisms to regenerate their vitality including horizontal transfer of genes from bacteria (lower right).

The solution the eucaryotes arrived at, at the very root of the eucaryote tree, was meiotic sexuality, where organisms in the diploid phase keep two copies of their genome and actively recombine these in meiotic gametogenesis, so that both sperms and eggs carry new haploid combinations of alleles (the maternal and paternal versions of a given gene) through crossing over, by lining up their genes in an indexed manner in the synaptonemal complex. These are then

brought together in the ovum in fertilisation and the development of a diploid embryo ensues. This means that each of our offspring carry half the mother's and half the father's genes, forming a new individual that has never existed on Earth before, unless there are identical twins or triplets.

The modern materialistic ambition in the pursuit of ultimate longevity, by seekers of a technologically-utopian 'final solution', amid human cloning and genetic modification, is a process of trying to turn elite humans into effectively parthenogenetic organisms, whose life span is indeterminate. These utopian aims are futile and ultimate selfishness. No parthenogenetic species can survive long term without sexual recombination and the biosphere to support them. Bacteria and archaea exchange genes promiscuously, even between species, via viruses and plasmids. An extreme is found in some bdelloid rotifer species, which appear to have been parthenogenetic for 40 million years, because their alleles are highly discordant, but they have been found to cryptically scavenge genes from other sexual rotifers or even fungi and bacteria. So the quest for technological immortality amounts to becoming mutant ninja turtles keeping their genomes viable by endless genetic engineering.

Eucaryote sexuality is a deeply embedded form of genetic symbiosis. Men and women share almost all their genes, but form genetic complements. Neither sex can continue to survive without the other. This is the most altruistic act of the evolutionary flowering because it means that, rather than trying to be individually immortal through parthenogenesis, we contribute a mere half of our genes to the next generation to create new life forms unique unto themselves yet in the parents collective image just as in the allegory of the Sabbatical Creation. Hence as humans, we hunger for one another sexually because, in our very fertility the immortal web of conscious life is spun anew.

However, this also leads to our existential dilemma of sexual mortality as individual organisms. Because we are each unique and have an ego, to emotionally seek and secure our personal survival, we come to lament our mortal condition because, however exciting life is and however much we hunger for it to continue, we are doomed to senescence and mortal demise.

But we are just beads on an immortal web of life. Humanity exists as a species with a history running back down the tree of life for three and a half billion years. Individual organisms are mortal, but species and biospheres are perennially immortal, so long as Earth shall live, in a fertile and habitable condition. All animals, humans included, have arisen through the immortal fabric of natural selection and because of this are finely attuned to strive for life, to care for their young and their kin, even at risk to their own existence.

Despite paying lip service to the selfish gene (Dawkins 1974), Matt Ridley (1996) in "The Origins of Virtue" has sought to elucidate the intrinsic goodness of human nature in evolutionary terms, based on long term judgment of character, verifiable trust and mutual cooperation to survive, contradicting the Augustinian doctrine of "original sin" stemming from Eden:

Our minds ... have been built to be social, trustworthy and supportive. ... Human beings have social instincts. They come into the world equipped with predispositions to learn how to cooperate to discriminate the trustworthy from the treacherous, to commit themselves to be trustworthy, to earn good reputations, to exchange goods and information, and to divide labour. In this we are on our own. No other species has been so far down this evolutionary path before us, for no species has built a truly integrated society ... we owe our success as a species to our social instincts; they have enabled us to reap undreamt benefits from the division of labour ... They are responsible for the rapid expansion of our brains in the past two million years and thence for our inventiveness. Our societies and our minds evolved together, each reinforcing trends in the other. Far from being a universal feature of animal life, ... this instinctive cooperativeness is the very hallmark of humanity.

Founding human cultures tended to be animists – that is they viewed both living organisms and the natural phenomena around them as conscious agents, perceiving themselves as embedded in the web of life, even though it was in many ways also threatening, as a world of tooth and claw amid accident and misfortune. Viewing of the universe as conscious agents leads to a greater embedding in the matrix of life, in which the generations are treated as sacred, so both offspring and ancestors were revered, both as real biological organisms and as conscious spirit beings spanning space and time in the immortal passage of the generations. This is our founding Weltanschauung of Immortality, our deeply perceived world view of the intrinsic perennial perpetuity of life amid the mortal coil.

As we shall see in the animism section, this hasn't meant that all animists are good or responsible ecologists, because migrating ethnic peoples from the Americas, through Australia, and Madagascar to New Zealand have caused serious

species extinctions on their arrival, but the record of our founding cultures such as the San Bushmen and Mbuti and Biaka Pygmies do show such sustainable reverence for protecting the ongoing continuity of life in their practices.

With the rise of urban societies, the spiritual web of nature receded into the background and new human cultural inventions distorted and degenerated this immortal view of consciousness embedded in the matrix of nature. The spirits of natural phenomena such as storms droughts and thunder and lightning evolved into supernatural deities that became ever more abstract and powerful, despite clearly displaying the projected aspects of human agency in God's jealousy, anger and sometimes compassion as cosmic super agents in an allegorical universe of extrapolated myth.

In the East, another current emerged, in which the shamanic states of the vision quest became elaborated into a religious philosophy of renunciation of the worldly ego in a mind-sky devotion to mental transcendence, no longer explicitly linked to the physical immortality of nature as its embodiment, leading to attempts to escape the round of birth and death in a moksha which proved attainable by very few in this lifetime. This in turn led to notions of reincarnation to achieve realisation in a future lifetime, karma and the inexorable decline of spiritual unity into varying forms of the Kali Yuga in both Hindu and Buddhist traditions.

The notion of evil in our founding cultures is not associated with the divine negativity of a satanic force, but just the notion of bad rather than good:

When a missionary inquired into a Bushman's ideas of good and evil he was told it was 'good' to sleep with another man's wife, but 'bad' if he slept with yours. Still lamenting the Bushman's ignorance of absolute morality, he later asked the man, whom meanwhile he had discovered 'was in the habit of smoking wild hemp', what he thought was the most wonderful thing he had seen. The reply he was given, that no one thing was more wonderful than any other and that all the animals were the same.

This shows the San as retaining an egalitarian animist view rather than disproportionate awe in the religious hierarchy.

Morality is not a divine, cosmological fact of existence, but is rather a sociobiological feature of intelligent human and animal societies, where Machiavellian strategic bluffing is common, and social disapproval or punishment becomes an influence to reduce internal strife to enhance inter-social dominance of the group (Alexander 1987). But it became enshrined in urban societies in codes of law such as those of Hammurabi and has taken centre stage in theistic doctrines of good and evil forces and divine moral punishment.

Fig 267: The Fall; expelled from Eden, Adam and Eve raise a family and set to work. Scotin, c. 1765. The Fall specifically links, carnal knowledge, mortality and sexual reproduction.

The Edenic Fall constitutes a metaphor of this transition. Among the arboreal splendour and abundance of the primal Paradise stand two trees, the Tree of Life common to many Near Eastern cultures as an archetype of immoral fertility and a new wholly unnatural tree – the Tree of the Knowledge of Good and Evil. Yahweh says Adam and Eve, the Mother of All Living can eat of the fruit of any tree except this one. In the event, the Serpent persuades Eve to eat the “apple” and she bids Adam too and they become aware of their sexual privacy and cover their genitals with fig leaves.

This allegory then leads to the Fall of the Weltanshauung of Immortality, because becoming aware of their sexuality is also the awareness of their sexual mortality, disconnecting them as the primal couple from the very passage of the generations that sustains the sacred fabric of existence. This occurs in a context where immortal reproduction has been flatly denied. As the first human beings, neither have sexually reproduced, so exist like the asexual angels of Christian heaven, unaware they are able to procreate by themselves. God then curses the ground, driving them from the garden with the woman consigned to be obedient to her husband and travail in childbirth:

I will greatly multiply thy sorrow and thy conception; in sorrow thou shalt bring forth children; and thy desire shall be to thy husband, and he shall rule over thee.

And the man to have to live by the sweat of his brow amid the thistles and thorns in dominion over the natural world:

*cursed is the ground for thy sake; in sorrow shalt thou eat of it all the days of thy life;
thorns also and thistles shall it bring forth to thee; and thou shalt eat the herb of the field;
In the sweat of thy face shalt thou eat bread, till thou return unto the ground;
for out of it wast thou taken: for dust thou art, and unto dust shalt thou return.*

The Tree of Life is hidden since the foundation by a flaming sword lest they also eat of it and live forever:

*Behold, the man is become as one of us, to know good and evil:
and now, lest he put forth his hand, and take also of the tree of life,
and eat, and live for ever: ... and he placed at the east of the garden ...
a flaming sword which turned every way, to keep the way of the tree of life.*

Thus the Tree of Life that provided the immortal link was withheld, and humanity was doomed to mortal sexuality in ignorance of the ancient knowledge of the immortal web of existence that partaking of the fruit of the Tree of Life would have revealed anew.

One needs to understand at this point that Genesis is by no means the oldest, nor the cosmologically founding text in the Bible. Its putative date of authorship dates from the time of Solomon at the very earliest with scholarly opinions dating to the exile and one theory linking it to being as late as the 3rd century BCE. One theory for its inclusion is "Persian imperial authorisation" – that the Persians of the Achaemenid Empire, after their conquest of Babylon in 539 BC agreed to grant Jerusalem a large measure of local autonomy within the empire but required the local authorities to produce a single law code accepted by the entire community.

Also we need to recognise that to live forever is precisely what the evolutionary tree of life's diversity actually does. To live forever doesn't imply eternal, just unending, everlasting, that is, perennially immortal. This is both a biological and a spiritual reality of conscious existence. Eternality is rather a frozen static image of space-time as a whole.

The only references to the word eternal (Hebrew: עָלְמָי – unending, everlasting, perpetual) in the Old Testament are one in Deuteronomy referring to God and one in Isaiah referring to the Redeemer:

*The eternal God is thy refuge, and underneath are the everlasting arms:
and he shall thrust out the enemy from before thee; and shall say, Destroy them (Deut 33:27).*

*Whereas thou has been forsaken and hated, so that no man went through thee,
I will make thee an eternal excellency, a joy of many generations (Isa 60:15).*

The original Hebrew beliefs had referred only to Sheol, the underworld of the dead. But in the wake of the Zoroastrian eschatological renovation, the natural embedding in the fabric of the immortal life flow became seconded to a novel and alien apocalyptic notion of eternal life, either in Heaven or eternal torment in Hell. Thus we see the emergence of the word "eternal" applied to human kind only in the New Testament. Even the Gospel of Thomas does not refer to eternal life, although the preface cryptically says:

"Whoever finds the interpretation of these sayings will not experience death".

Neither do we simply experience death in the Weltanshauung, because life itself is immortal and we give our incarnate lives in our actions in the world to immortal life as a whole.

Thus the eschatology spawned initially by the Fall and finally by the apocalyptic Renovation shattered the Weltanshauung of Immortality, which was both naturally valid and evident and spiritually fulfilling in the perpetual regeneration of life, both in life as a whole and in the passage of the generations of humanity, replacing it with an destructive eschatology of the late planet Earth to be discarded as God's creation in the Day of Judgment in favour of a completely implausible, contrived and fundamentally evil war between light and dark principles, expanded from mere natural "badness" or personal selfishness into satanic eternal cosmological evil, to which all human beings are claimed to be fatally drawn leading either to eternal Heaven or unrelenting torment in Hell.

This is replacing the real life we have where we are conscious agents having real volitional efficacy over the physical world and cosmological responsibilities to the continuity of life to uphold, with the false hope of an afterlife which does not and cannot exist in the universe as we know it, cannot contain all the living creatures since Earth began in any

biospheric meaning and wastes our very agency on a fantasy where Heaven has no autonomous agency and no further meaning or purpose in life. If we want to experience such realities, we can do so through the biospheric sacraments, which do convey the experience of union with the living spirits of the universe throughout space and time, just as we can experience moksha escaping the Eastern round of birth and death in this life in the same way.

Fig 268: While Heaven above and Hell below are fictitious realms of the religious imagination, which have no basis in cosmological reality, the evolutionary process centre, which many Christians abhor, is actually the immortal passage of the generations, in which humanity has flowered into cultural emergence. But what are we now evolving towards in the centre image – AI takeover? In living immortality lie all our future hopes of survival, not a Heaven or Hell frozen eternally in time where Hell is one long scream of no fruitful meaning and we have no idea what we would creatively do in Heaven except sing hymns of praise, with no autonomy, no creativity no real life. Religious ideas of heaven are contradictory. Heaven lacks redemption through our own agency as conscious sentient beings protecting life in the universe. To preserve our species immortality in the face of a mass extinction of the entire diversity of life caused by humanity ourselves it is absolutely essential that we return to our conscious spiritual roots in the Weltanshauung of Immortality.

To see how deleterious, incorrect and deceitful this destructive eschatology of nature is, one simply needs to compare its claims with the natural realities of the universe as we have discovered it.

While perennial immortality is an incontestable fact of existence going back 3.5 billion years almost to the time the Earth's oceans first condensed, the notion of eternal life is neither natural nor is it any kind of spiritual fulfilment.

Since the discovery of relativity, we know that time is not a supernatural parameter independent of space but that the two are conjoint dimensions in space-time as a whole and space-time is eternal but fixed as everything there has ever been and will be. You can see this looking at the universe sideways on in fig 15 above in the right-hand image of Paradise on the cosmic equator. Once we view space-time from outside all the way from α to Ω , it is simply the entire history of the universe – everything that happened, sitting eternally in space-time. All our lives, from birth to death are in there somewhere, static and stranded, as everything there has been and everything there shall be. You can't do anything creative in eternal life, it is just static like the snowflake in the figure below. Believers have a notion of angels singing heavenly praise of God and Muslims have a sexy heaven with 72 black eyed virginal houri made anew every day for the pleasures of men, but its just a static vision, where the houris are not real people and can't really share your love, or concerns because they are born anew like Alexa rebooted again and again. It's all a ground hog day denying us the very creative agency of conscious existence the real world provides us here and now, which also provides us with cosmic responsibilities to ensure life continues to flower in abundance so that the universe can come to understand and know its own becoming.

Fig 269: Snowflakes have astoundingly varied individual forms that are created dynamically at the atmospheric ice-vapour interface by incoming moist air condensing individual water molecules, which "walk" over the surface quantum mechanically to preserve the ramifying symmetry. Yet the end result is "death" – a frozen life history of its becoming, "eternally" static in time once the dynamic process ceases.

We thus come full circle back to the elephant in the room. Both the materialist universe, as the ultimate machine, mindless of life in the computational paradigm, and the theistic view of supplicant will, dominion over nature and destructive eschatology, both lead to a human-induced mass extinction of life, when the cosmology of the living universe is founded on symbiosis, not capitalistic dominance and

competition, which are actually subcomponents of a predatory ecological strategy. These views are thus inconsistent with long term survival of our species in the closing circle of the living biosphere.

Thus we have a two-fold urgent, yet realisable task for humanity to achieve as fast as we possibly can : (1) To restore the living diversity of evolutionary tree of life in the biosphere, before a human-induced mass extinction destroys our 3.5 billion year genetic and living heritage and (2) to restore the paradigm of the Weltanschauung of Immortality in the full resplendence of life in the universe, shining brightly forth again, because this is the spiritual realisation of our cosmic 'destiny' as transformative conscious agents, having volitional agency over the living world around us, to restore the sanctity of life, so that existence can unfold unabated in the universe.

Paradoxical Asymmetric Complementarity

The Koan of the Tao of Existence
The objective universe is necessary
but subjective consciousness is primary

Symbiotic existential cosmology is a paradoxically asymmetric complementarity. It is neither dual-aspect monism nor naturalistic dualism and transcends both. The cosmology is founded on a cosmological paradox — we can't eliminate the physical universe because our lives and our ability to deal with the affairs of the world depend on it, yet all our experience of it is through the subjectively conscious mind, and we don't know the universe can actually manifest without this. So 'mind' is primary, although the universe is necessary to to our existence and to life itself. This is the koan of the Tao of existence, which becomes integral to our causality-violating volition, which ostensibly intervenes in the causal closure of physical brain processes, through quantum uncertainty, our "cubic centimetre of chance":

All of us, whether or not we are warriors, have a cubic centimeter of chance that pops out in front of our eyes from time to time. The difference between an average man and a warrior is that the warrior is aware of this, and one of his tasks is to be alert, deliberately waiting, so that when his cubic centimeter pops out he has the necessary speed, the prowess, to pick it up (Castaneda 1968).

Reality is an overlapping cascade of manifestations of a universal principle that emerges in quanta, but is manifest also in dynamics and biology and reaches all the way to the lateralised cortices of the brain. This is the principle of asymmetric complementarities making up an integral whole that arises from the phenomenon of symmetry-breaking.

This happens at a fundamental level with the wave and particle aspects of quantum reality, where the wave aspect is continuous and the particle aspect is discrete. The uncertainty principle $\Delta E \Delta t \geq h/2\pi$ neatly expresses this symmetry-breaking structurally in the inverse relation between E as the wave frequency and t as the temporal position of the particle. It is neatly defined by interference between a sampled wave form and a standard wave confirming the energy-time and position momentum-uncertainties, but the wave is commonly regarded as a calculation artefact. Indeed quantum field theory is particle-based except that the Green's function is a hidden wave propagator. On the other hand a point particle is an infinite energy self-singularity so we end up with superstrings and so it goes.

The standard model of physics list the known particles as radiation/force forming particles of integral spin and matter forming fermions of half-integral spin which stack only in pairs. These fit together, but in a highly asymmetric arrangement. The fermions, although they are complemented by the bosons in the standard model are asymmetric with strikingly different particle populations although these splice together seamlessly in the universe around us. Within this there are three others. The symmetry breaking of the weak and electromagnetic forces gives three heavy weak photon carriers and one massless electromagnetic photon. There is a deeper symmetry breaking between the colour force whose colour charge goes in threes and the weak-electro where it goes in twos. Finally we have gravity standing alone as universally attractive, while the rest are attractive-repulsive vector particle fields.

Supersymmetry, or SUSY as it is called, is the idea that each boson is paired with a fermion one half-integer of spin apart. This idea arises because the negative vacuum contribution of the fermions appears to cancel the positive contribution of the bosons, for example solving the hierarchy problem the huge energy gap between the scales of the standard model forces and the Planck scale of gravitation. The trouble is that the standard model has a very different set of bosons from the set of its fermions. This doesn't mean that the underlying symmetry is not true but that it must be broken, as indeed the weak-electromagnetic symmetry is. The fact that so far no supersymmetric particles have been discovered reinforces the idea that saying a 1-1 correspondence might not be the natural Occam's razor solution. Garret Lisi had a classification in his Exceptionally Simple TOE and his prediction that the LHC wouldn't find SUSY held.

In particular the 240 vector root system of E8 has 112 “bosonic” permutations of $(\pm 1, \pm 1, 0, 0, 0, 0, 0, 0)$ asymmetrically complementing 128 “fermionic” permutations of $(\pm 1/2, \pm 1/2)$.

So the symmetry-breaking basis implies that asymmetric complementarities arise as a secondary consequence of the symmetry-breaking process itself and should be universal. I.e. symmetry-breaking does not lead to symmetric complementarity. But wait a minute! The standard model is symmetry broken, so how can supersymmetry be feasible at all? Why isn't supersymmetry also manifestly broken? What we find is hypothetical soft supersymmetry breaking in which it is envisaged that a symmetry breaking of supersymmetry occurs which is unlinked to the symmetry breaking that causes the standard model.

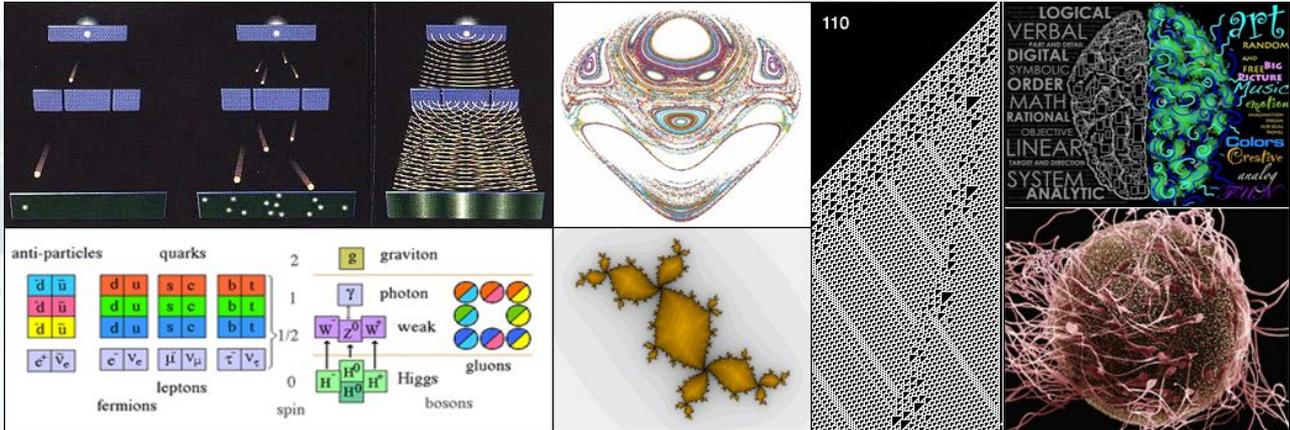

Fig 270: The natural universe contains many potentially overlapping forms of asymmetric complementarity, wave-particle as revealed in an interference experiment, fermion-boson matter-radiation complementarity, chaos and order as demonstrated in both conservative (above ordered closed cycles chaotic dappled orbits) and dissipative systems (below grey/yellow ordered black chaotic), in cellular automata, where the edge of chaos invokes universal computability in the elementary two state 1D automation 110 and in biology in sexual complementarity (human fertilisation) and in the characterised differences in cortical lateralisation.

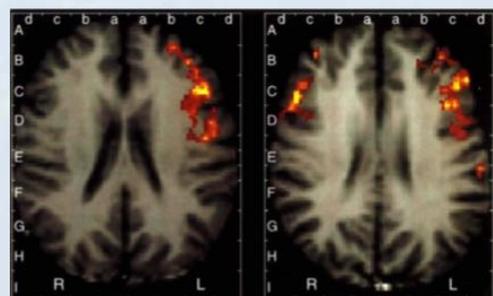

As briefly summarised in wikipedia: “Soft SUSY breaking decouples the origin of supersymmetry breaking from its phenomenological consequences. In effect, soft SUSY breaking adds explicit symmetry breaking to the supersymmetric Standard Model Lagrangian. The source of SUSY breaking results from a different sector where supersymmetry is broken spontaneously. Divorcing the spontaneous supersymmetry breaking from the supersymmetric Standard Model leads to the notion of mediated supersymmetry breaking.” Of course supersymmetry hasn't been realised, so physics has failed to give us a clear answer.

But this is just the beginning of the picture. Chaos and order are abstract complementarities in dynamics, which have asymmetric relationships, for example the quadratic Julia set is chaotic and its complement, the ordered Fatou set, are asymmetrically complementary. Likewise in conservative dynamics such as asteroid orbits and the double pendulum regions of ordered orbits are permeated by dappled chaotic trajectories.

It also pervades biology. Sexuality has a similar basis in symmetry breaking because symmetric gametes in eucaryotes result in very costly mitochondrial warfare upon fertilisation, so that there are a vast number of quasi-particulate sperm and one oceanic ovum waiting to engulf just one of them. In higher plants the chloroplasts are also at war. Hence eucaryotes evolved sperm-ovum sex, where the female has the mother cytosol with the mitochondria while the male just has a motile sperm whose mitochondria, essential for swimming to the egg are largely destroyed on entry. This means female parenting investment is disproportionately greater than male and the sex wars ensue. Hence only 3% of mammals are socially monogamous and even those aren't genetically monogamous.

Fig 271: Left and right hemisphere hubs. Composite images of the distribution of activations comparing rhyme-case tasks (phonological processing) for 19 males (left) compared to 19 females (right) (Shaywitz et al. 1995).

The same symmetry-breaking argument applies strongly to the left and right cortices of the brain, where the efficiency of lateralisation is that symmetrically duplicated cortical functions are a tragically inefficient

use of resources. Language is predominantly on the left side in Broca's and Wernicke's areas although this is less so in females (Shaywitz et al. 1995) and in music and language perception (Albouy et al. 2020) where frequency space is in the right hemisphere while the understanding for the lyrics is in the left, and in the notion of the left side being more analytic and the right more holistically synthetic. Left-lateralised hubs included regions from the default mode network (medial prefrontal cortex, posterior cingulate cortex, and temporo-parietal junction) and language regions (e.g., Broca Area and Wernicke Area), whereas the right-lateralised hubs included regions from the attention control network (e.g.,

lateral intra-parietal sulcus, anterior insula, area MT, and frontal eye fields). Left- and right-lateralised hubs formed two separable networks of mutually lateralised regions (Nielsen et al, 2017).

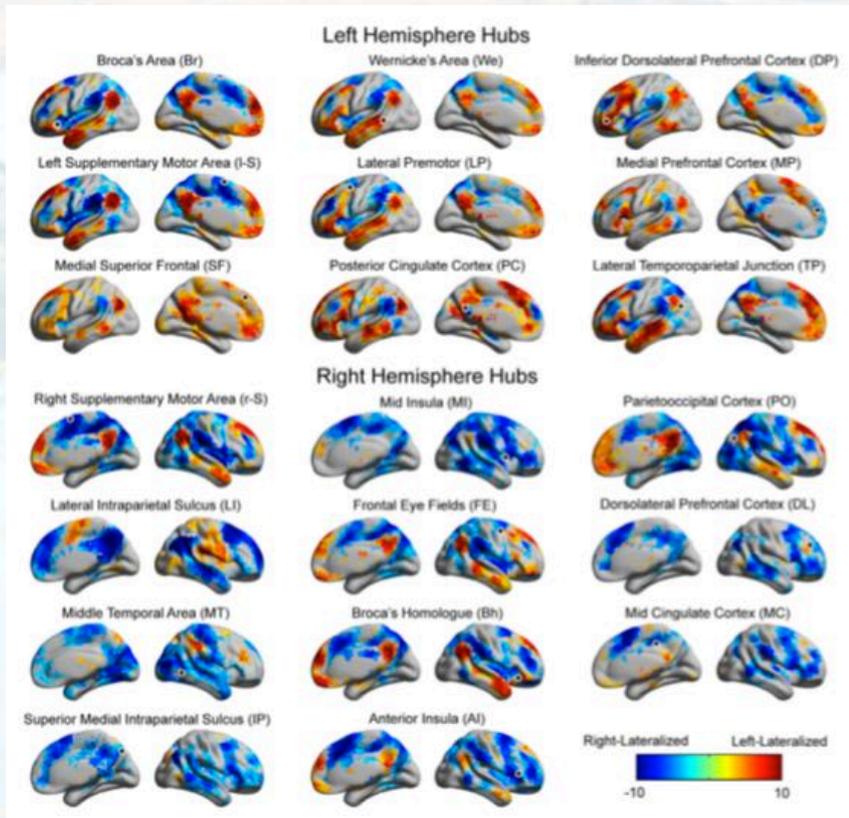

Fig 272: Left and right hemisphere hubs.

A little more prosaic, we have time and space, past and future, and in the prisoner's dilemma of defection and cooperation which also have an asymmetric relationship. This is what Tao and Tantra as an asymmetric cosmological principle of creative and receptive, or male and female are all about, so let's go right into the centre of the cyclone, subjective consciousness and the physical universe, where Eastern philosophy notes that mind is indivisible while matter is not. Asymmetric complementarities do not all arise from the same source but do have common predisposing features of

overall efficiency through symmetry-breaking.

Now we run into the hard problem of consciousness. Given that we are subjectively conscious beings possessing volitional will over a universe we know only through our conscious experience of it and the universe in turn becomes manifest only through its conscious sentient beings, the meaning of existence is created through our journey of discovery as conscious agents transforming the universe by our insights and actions. Thus, while the universe is necessary, consciousness is primary.

This raises a serious problem about attempts to mount abstract descriptions of the ultimate generating theory underlying the subjective and objective reality of consciousness and the universe. If consciousness violates physical causal closure, how can we describe any functional or causal TOEx (theory of existence)? If the universe can only manifest through our conscious experience of it, what hope is there for any single stand-alone TOEx as a pure abstraction? How can it actually manifest subjectively, except as a piece of mathematical reasoning? But this is not manifestation of the subjective, it is just a mathematical thought in the mind of the beholder.

That said, objective reality and our descriptions of it do show natural convergence to the subjective complement. Many aspects of physical brain function look like the same sort of phase coherence sampling we see in the uncertainty principle and edge-of-chaos phenomena and self-organised criticality provide the ability of the quantum reality of the physical universe to develop a convergent interface with the conscious mind. The same is possible even for information and computational descriptions, such as Stephen Wolfram's (2021) account "What is consciousness?".

The trouble is that forms of rational and logical thought and well tried models of causal deduction, which everyone is very familiar with, tend to be the main instrument people tend to apply. Attempts to structure the subjective realm in

approaches such as [Pan-protopsyshism](#), have deep analogies with reductionism and the same pitfall occurs with all abstract logical attempts to form a mind-universe monad TOE underlying cosmological complementarity.

As we have noted, when we start with subjective conscious volition over the physical world as a mutual affirmation between conscious agents. Instead of the hard problem, this leads to accepting at least some matter (brains) have a hidden subjective aspect which can affect their outcomes, possibly through uncertain instability. This means that the hypothesis of physical causal closure is eliminated by Occam's razor. But then subjectivity is a natural material property and brains obey the same four core quantum forces, even if they have quasi-particle states etc. So the occluded subjective aspect becomes complementary to the physical universe as a whole (where → represents an asymmetric complementarity):

Cosmos = (Quantum universe (particle → wave) → Mind at Large)

Our individual conscious experiences are encapsulations of this complementary aspect, modulated by the very brain dynamics we are looking at in the EEG and action potentials, as a biological neural net – except that it is a fractal neural net operating in a scale-traversing handshaking manner all the way from the quantum to the organism.

This is one of the one-mind forms of quantum reality and coincides with Erwin Schrödinger's comment:

“There is obviously only one alternative, namely the unification of minds or consciousnesses. Their multiplicity is only apparent, in truth there is only one mind. ... I should say: The overall number of minds is just one”

This leads to the most asymmetric complementarity of all. And it carries with it fundamental challenges to any form of logical description, because the subjective aspect has a series of adventitious characteristics: It is volitional, intentional, idiosyncratic, exploratory, imaginative, innovative, creative, and visionary.

How are we supposed to logically, or causally, or functionally, elucidate something that is the key central part of creative intentionality in the cosmic becoming? This is an awfully steep mind-boggling challenge! The reality is that, as conscious volitional agents, we are the creative process of the universe in sentient motion. We can talk about it round the camp fire and make up myths and stories about it, as we do in science, with profoundly informative effect that we are all in awe of. But when we paint ourselves into the corner of consciousness itself we come to the elephant in the room. Consciousness is the causality-violating creative principle in action expressed through self-organised criticality in the brain and quantum uncertainty itself. We cannot elucidate it causally, because our very intent will override it, but we are realising it spontaneously as we enact history in the multiverse and that is our cosmological role.

We are thus the collective 'Elohim of the living universe incarnate entities of transformation. We are personally responsible for the fate of the living planet. The ultimate buck cannot be passed. The least of our priorities is analysing logically who or what we are. We are bound in a covenant with the universe to protect the diversity of the Tree of Life, in our becoming and in the becoming of planet Earth as a living survivor of the [Fermi paradox](#). All we have is a small window of opportunity to unite in our diversity to achieve the one central necessary condition for our continued survival and existence, through which the universe itself is manifest – protect the diversity of life on Earth from its immanent mass extinction in a destructive human-induced anthropocene catastrophe.

The Natural Face of Samadhi vs Male Spiritual Purity

There is a very important reason why Symbiotic Existential Cosmology is fundamentally different from everyone's ideas of spirituality, samadhi and moksha.

The Eastern tradition is based almost universally on renunciation and control. This produces a different kind of samadhi because it evokes a whole constellation of concepts involving mental control, emptiness rather than the fullness of natural life, permanence rather than flux and eternity rather than temporality. Monotheism does likewise, imposing the absolute rule of eternal order enforced by everlasting punishment and the triage and abandonment of natural life. Both enforce morality rather than provide direct natural enlightenment.

This is a very ancient product of men attempting to control the tokens of gatherer-hunter culture and inventing mind-sky cosmologies to address intrinsic male fear of mortality. Women don't share this because they give live birth, often at great struggle and witness their own flesh and blood suckling from them and slowly maturing. Consequently men stare at the sky, invent sky gods and storm gods and ultimate realities of a spiritual world that in their view transcends nature. Women in turn are regarded as 'unclean' and nature is regarded as subservient. Female reproductive choice is repressed and women become the property of men, distorting the evolution of intelligence and the human sense of integration with the biosphere. Female deities such as Kali are pushed to the periphery and associated with chaos and physical decay into conflict. The very best we get is Shakti as the physical aspect of Shiva's consciousness spawning the Maya of mortal physical life.

Our entire cosmological viewpoint has become corrupted by male dominance over sexually antagonistic coevolution, where women have to endure pregnancy and live birth and need to choose intelligent male partners because of their primary investment in parenting, while males although they seek to sew wild oats, as their investment is primarily reproductive, want to control female reproductive choice because even in their mortal anxiety, it at least gives them paternity certainty when women are always certain that the issue from their wombs is their own flesh and blood. Hence the rise of patriarchy over the matriarchy that still continues today.

The crisis of a mass extinction and climate heating, which could destroy our planetary resilience and our tenure as a species is intimately linked to this sexual crisis and needs urgent correction, not just to save the future of life and our species, but for us to even begin to understand the conscious mystery that lies before us. The severe degree of renunciation and control required for full Vedic samadhi, accompanied by stereotyped notions like astral substrates of ethereal experiences leads to concern that controlled samadhi is a restrictively inferior form of enlightenment. Symbiotic Existential Cosmology, rather than seeking spiritual purity of some ethereal or astral realm or pure consciousness in the absence of nature and matter, seeks the edge of chaos where immortal life flowers and unfolds.

Fig 273: Fractal enlightenment

This produces a different kind of moksha samadhi, full of light and visionary significance that transforms our lives into full symbiotic integration with nature. It rejects the myth of control, where enlightenment can only be achieved in emptiness and renunciation of natural and worldly existence. It is spontaneous and creative, pro-life and the sacredness of nature. It is free-wheeling and doesn't require long tedious hours of withdrawal from positive engagement with the world. It doesn't require renunciation of conjugal love and family life in spiritual pursuits and is consistent with science and the lessons immortal nature has to teach us. The truth is clear and unambiguous. The samadhi of life transcends the samadhi of emptiness. Engagement transcends renunciation. Flux transcends stasis. Life transcends death.

The fact that Vinod has to cite a work by a deceased Himalayan ascetic in a world of eight billion people with 1.5 billion in India alone, attests to the unachievable rareness of 'genuine' samadhi in the Eastern tradition. Many people are using meditation in both the East and the West, but genuine evidence of significant non-ordinary mental states indicative of genuine mystical transformative experiences remain rare and ambiguous.

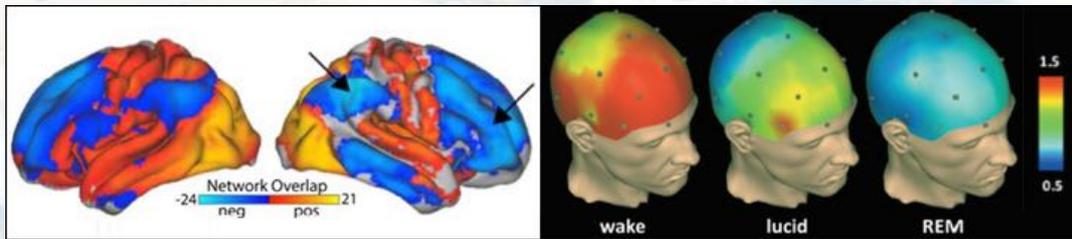

Fig 274: Left: REM state vs waking activations (red-yellow) and deactivations (blue). (Uitermarkt et al. 2020)
Right: Lucid dreaming occupies an unstable region between REM sleep and full waking arousal (del Giudice et al. 2022)

Entheogens are of ancient shamanic use. They are fully natural and evolved by life itself. They are physiologically non-harmful. They complement and complete meditative vigils in transformative ways potentially of great interest to science and cosmology. The only other such resource we have is dreaming but this is particularly hard to control and lucid dreaming states generally result in rapid awakening due to the activation of the reticular activating system of waking consciousness. They also suppress memory of dreaming states unless we immediately wake up, because they are involved in memory consolidation and tend to suppression of parts of the brain involved in conscious focus and free-will, so are well complemented by waking entheogenic experience.

Patanjali in the Purohit translation notes: *The Siddhis are born of birth, drugs, mantras, penance or Samadhi. (IV-1) Powers are either revealed at birth, or acquired by medicinal herbs, or by repetition of sacred words, or through austerity, or through illumination. ... All know the healing qualities of herbs; only a few know that some of them have the qualities of awakening spiritual powers.*

Clarifying Cosmic Karma

Many of us have deep confusions about what karma is and does and what it doesn't do and apply these notions to a degenerate view of what karma actually is. Both reincarnation religions and monotheism are moral cosmologies. Monotheism puts the moral feedback off to the day of judgment, but karmic religions do it through reincarnation.

The first point is that moral cosmologies are false cosmologies that are anthropocentric and in conflict with natural moral sociodynamics in animal and human societies that are clearly feedback processes to inhibit intra-social competition to achieve inter-social domination and the survival and expansion of the group. It's a purely evolutionary manifestation of intelligent societies with significant social bluffing.

Fig 275: Two incorrect notions of karma: Left inevitable cause and effect and right a cosmic conscious moral retributor.

The notion of Karma as a moral force is ill-conceived. Before human culture and religion came about, there was no natural evil. Life is an endless struggle to evolve and diversify every which way. While it's never in perfect balance and largely at the edge of chaos, the diversity of life rises to climax because the plants provide solar energy and the animals can survive eating the plants but also fertilise them and by their very predation result in plant diversity by evolving to hit the weedy species. The same for herbivores and carnivores culling them thus avoiding boom and bust of the

herbivores through grassland famines. The same for parasites and prey although we abhor covid, rabies, malaria and ebola. Parasites and prey are key to the Red Queen race that made sexuality and multi-celled eucaryotes possible. Ironically, sex is also the source of organismic mortality but that's the breaks. Parthenogenesis is unsustainable hubris.

The notion of moral karma was devised by religious doctrine to inhibit intra-social competition to achieve inter-social dominance just as all intelligent socially-bluffing societies do, but it has been launched into a cosmological dimension in the idea that moral causality drives divine punishment including the notion of karma and the Day of Judgment in monotheism. Actually these have a common source in the Indoeuropean culture that spawned both.

Now we have all ended up debating a person's individual karma in relation to the bad karma other people might witlessly inflict on us, with disease or accident due to their acts or emotional afflictions. This is artifice. We all need to say stop bas enough – this is unnatural. It all came, not from nature but human culture causing runaway forms of social punishment extrapolated onto the cosmos, and in the case of Vedic karma and reincarnation, from the inability of the samadhi tradition to provide moksha in this life, due in good part to the lack of visionary sacraments in the East.

So we need to look more closely. Just as there is no natural evil, the universe has to have rough justice for life to survive. The way the entropic universe and the negentropic nature of life intersect means some people will suffer the vagaries of fate, because this is the way the diversity of life flourishes in the molecular universe. There is a deep meaning here but we have as yet barely scratched the surface and the Vedantic idea of Karma is just pulling the wool over our eyes.

All the situations where bad karma – accidents, disease etc. seem to come out of the blue is sourced in environmental uncertainty. But the world is not classical. We can try to classically trace back the cause of bad karma. We can speculate that the car that hit my relative should have had a mechanical check or blame it on the driver having one too many, but ultimately the source of environmental uncertainty is quantum uncertainty itself.

The world we think is classical is the most outstanding form of open system chaotic quantum billiards of which cosmology is composed. All molecular interactions are quantum billiards in which the wave functions are spreading off every intermolecular encounter. It's open system quantum chaos par excellence. So everything that happens can be traced back ultimately to a butterfly effect in the past where the trajectories diverged. There is no such thing as randomness, there is only quantum uncertainty. So to understand the roots of karma, we need to understand that all events are caught up in a non-random hidden variable account and that we still don't understand how this meters out but that conscious sentience and volition plays a central role in the process. Hence all the fringe phenomena from synchronicity to psi get drawn into the loop.

Because I know this and know every step I take could have utterly unforeseen consequences, I try to keep half my mind listening to the winds of fate. I don't try to push the river. I don't seek psi because psi runs in my veins like the fruit of the tree of life that dilates my pupils like Dune spice melange and could not only come back to haunt or bite me or others, but could come true once and for all in ways I neither desire for nor conspire to. Only by letting go of my karma and giving it all back to life can I be confident of my intrepid journey into the unknown.

If you want to be part of this true karma, there is one and only one way through. Protect the diversity of life with our own mortal lives. That is the only currency we possess and it is borrowed capital we can't take with us. If the high traditions of spirituality can't induce us to do this, let them go. We are ourselves transformative of the entire universe and sacred beings in this respect, but if we squander our capital doing bad deeds or even just speculating and debating and don't save the life of the universe, while we are alive, we are dead meat.

Deepak Chopra: Dear Chris, It would surprise people to learn that the sentiment quoted above — “I use my memories — I don't let my memories use me” — is a telltale sign of higher consciousness. In fact, any step in the direction of personal evolution loosens the grip that memory has on us. If you want to know what blocks you from experiencing bliss, joy, fulfilment, love, and creativity, the chief culprit is memory.

Chris: Your comment reminds me of [Carlos Castaneda](#) (1968, 1972, 1975) and “erasing personal history”. Something I also live by, although he is now regarded as a confabulator of folk tales of the nagual, and it is claimed that after he died, I think of liver cancer, his female acolyte authors vanished in the desert and the bones of one were found in a deserted mine. It is believed they entered a suicide pact with the aim of meeting him on “the other side”.

One of the things about wild travel in foreign countries all alone is precisely erasing all memory of oneself. In fact the best time to erase your memories is when your back is against the wall. The trouble is that karma gets woven into it and sometimes the stories never end.

On my first visit to India, I made it into Ladarkh, the second season it was open to tourists. One day I was standing in Leh, where there was a little ruined potala on the hill above the town. I resolved that I would walk to the village on the horizon and let nothing stop me. So I walked out of town in my jandals and one of them broke, so I headed on barefoot. A Ladarkhi woman in national dress walked up to me in the fields and embraced me amorously, but I headed on into the village because any of the menfolk could see the fields below. Immediately, I was bitten on the ankle by a village dog, which began a long journey through Indian A&E clinics because the old vaccine, which required 14 daily shots in the stomach had a 1% mortality risk from brain inflammation due to the vaccine being cultured on chicken brains. So at every city I came to, Leh, Srinagar, Jammu and Delhi I had to join the queues of penniless people trying to get free medical care, with all manner of injuries and maladies. In Kashmir, I waited for my shot sitting beside a youth with a green face, who was vomiting in a bucket. The male nurse picked up the syringe and dropped the plunger at the feet of the youth and picked it up again and made to fill it from a huge old bottle of vaccine. I said "sterilise the syringe!". He said "I see you are an educated man! But by the time I got to Delhi the nurse had 50 needles and about 200 people waiting in a long queue so it was simply a raffle. Shortly after I caught hepatitis and had to recuperate in Mcleod Gang above Dharamshala.

When I felt a little better, I had a double fried egg thukpa and my liver survived, so I set off on the overland. I descended the Himalayan foothills and ended up in Amritsar heading for the Pakistani border. After visiting the Golden Temple, I was accosted by a tipsy customs agent. When I had previously entered India from Nepal the border guard had tried to demand baksheesh and I told him that was corruption. The trouble is that he then didn't stamp my entry visa, so this customs agent claimed I was a drug runner that had just entered India. A commotion ensued when he tried to arrest me. That was when Indira Gandhi had automatic 90 days in jail without charge, and a commotion arose with about 50 people jostling around me, so I knew I had to get out of this. I did something no Western man in the street should do. I got down on my hands and knees and wept bitter tears saying he is trying to abduct me! I tried to crawl away under the crowd, but somebody grabbed me. Eventually the customs agent got into a debate with the station master and I managed to escape. Next day I arrived at the border, which was a no-mans land about half a kilometre across a field to a last outpost of India, and there was the customs agent. I said to him you were drunk, and he lounged on his wooden chair and let me through.

When I got to Kabul I needed a yellow fever vaccination, but I had had enough of needles, so when the doctor gave me my certificate before the vaccination it was too good an opportunity to miss, and I scarpered elated and took a bus back to the Abdul Satar Hotel where the proprietor smoked hashish with all all on the rooftop. But in the packed bus a little kid stole my passport and all my travellers cheques and I was left penniless with only the vaccination certificate to my name. Now a weird twist of fate occurred. In Varanasi, I had bought a defunct sitar from a sitar teacher whose bowl promptly broke off. I accused him of selling me a pup, but he said "Oh no Uncle, I have not deceived you"! He picked it up and played a raga so profound that it brought tears into my eyes. So I ended up hauling the thing all around India in a huge case that took an extra seat in the bus, which they kept trying to throw up on the roof. So in my penury in Kabul with nothing else to barter, I took my sitar down to the souk and a man immediately ran up and offered me \$50 US on the spot, because he was part of an Indian music troupe and couldn't get a sitar for love or money.

Eventually the money got me through to Istanbul, where my parents had remitted money, with some dire escapades eating in wayside restaurants without having the money to pay, in Iran.

It was only 40 or so years later preparing for intrepid travel to Vietnam, Yunan, Korea, Japan and Taiwan that I had a test for Hep and found I was immune to Hep A and found out which kind of hepatitis I had originally contracted.

So there it is!

John Kineman: I think it is important to understand that karma also has a general meaning that is more scientific than the idea of a judge exacting punishment or failing to be benevolent. Technically, it is the systemic effect of action on the future. That is, it suggests more than physical causation where a rock falling on a glass table breaks the table. It is a material action, but before we get to its effect on other material bodies there is a contextual effect. So, murdering someone does not directly result in jail or execution, it perturbs a legal context that after going through its very

different kind of causal relations (inductive process) it produces a functional outcome, which may be to exonerate the act or punish it. That is translated again into the world of action and some physical means is decided. In the same way, acting out or malice has a tendency to produce feed-forward actions that in a similar context may be seen as having a similar meaning or character. So, the simple expression of this principle that a Unity Minister once told me “you get ugly, ugly’s gonna get ya”, is an example of how it happens, but it is not an explanation of how that happens. “Ugly” is not an agent that judges and responds, it is just how we characterize the actions in our contexts. It is all about the non-mechanical relation between events and contexts.

So, my understanding is that the technical view of karma has nothing to do with crime and punishment decided by a cosmic entity. It is the future systemic effect of past actions perturbing a meaningful context. The popular view focuses on our past actions in the context of our intentions, and indeed there is a feed-forward of that, but like any general law it also applies to actions by others and actions occurring naturally, in contexts we unavoidably participate in. So, while there may be cases where we can see a direct feed-forward of our own behavior motivations, there can be other cases where we have to deal with the feed-forward of other people’s intentions and even of nature itself. If climate change really gets going it may alter the global weather patterns to such an extent that agriculture begins to fail from being misplaced from its optimal climatic norm. This might be a karmic effect of our inability to control emissions, when viewed strictly in a human context. But the same thing could happen naturally, or from a close pass or impact of an asteroid. Still the physical conditions are changed in a way that brings difficulty and suffering. Similarly there can be physical actions that feed-forward to benefits in our highly selective contexts.

I think the point of this is that sometimes we can attribute a form of blame, praise or judgement in a human context where we are used to thinking that way, but not always. Most systems have complex relations where one can speculate about personal trajectories but it is still nature operating as nature with us as participants. So yes, if this view is taken, our concepts of personal responsibility, fairness and justice do apply, but not exclusively or decisively depending on what other contexts are involved. The basic problem with the popular view is that karma can’t be exclusively personal because no person is exclusive. On the flip side where we can’t attribute personal blame to someone or some concept, this might also lead to the idea of victims, which spiritual philosophy doesn’t want to support, and yet that is also a context dependent determination on our part and can’t be blamed on a cosmic will, being only the consequence of collective activity.

I think this leaves room for personal responsibility and consequences that the various popular notions of karma focus on, but also shows that there is much more going on such that personal responsibility can’t always be assigned. Collective responsibility also is real, but can’t always be assigned. Bad things can happen to good people and vice versa, but that doesn’t mean we are not also responsible for our actions in a more limited context.

Chris: That’s a beautiful account John! But you have to be honest as a Vedantist that this is an adaptive rewriting of spiritual karma into a pseudo Gaia hypothesis of autopoiesis. It may be that agriculture will fail with climate crisis and send us back to the gatherer-hunter phase under profoundly less habitable conditions for our species but this doesn’t solve Cathy’s dilemma of the contrived, inexplicable and ad hoc nature of individual, karma like her dementia case, or anyone who gets cancer, or suffers serious debilitating head injury and so on.

And this doesn’t make sense in the biosphere as a whole. It’s a form of over-determination, or hyper-causality, that assumes more indirect consequences than the actions themselves precipitate. The biosphere teaches us that all niches, plants, animals, fungi, protista and prokaryotes and even viruses are legitimate. Often seemingly counter-productive events are due to conflicting selective forces, as with Covid-19, which started out a symbiotic bat virus and then became a parasitic pandemic due to human trafficking in wild animals. The problem with moral karma is that it is unscientific, because morality is a product of strategically bluffing intelligent animal societies to avoid internecine breakdown of the diverse niche constructions that strategically bluffing societies allow to achieve inter-social dominance.

To attribute scientific meaning to karma, you are reinterpreting an historically incorrect Vedic cosmology linked to reincarnation, because moksha is so elusive by meditation alone. You are now reinterpreting it as an expression of a Gaia principle, but no geo-physical or bio-physical collective feedback can afford to involve fundamental cosmological overdetermination of the biosphere’s natural adaptability, or diversity would become undermined. The way the laws of the symmetry-broken standard model work is to evoke critical phase transition states in both evolution and the

emergence of consciousness in which subjective consciousness can emerge and have survival efficacy for the organisms possessing it – i.e. all eucaryotes. It has to be and is free of over-determination for this very reason.

Hence the only recourse to a psychopathic killer who gets away with blue murder is that his “warrior” genetic makeup may prejudice the future of his offspring, not because “what goes around comes around”, or be ugly and you get ugly. By the same token compassion is not an antidote to misfortune, it’s just a way of sharing and caring these slings and arrows. In fact the reverse occurs. Emotions are a common palette that provide for natural and sexual selection that is not confined to genetic kin, but can become oceanic compassion in the face of agony and outrageous misfortune. But none of this stops misfortune itself.

We still don't know how the universe makes individual decisions about fate and it's not an adequate answer to claim the blind justice of pure randomness or stochastic causality, although that's the effective breaks we have to deal with in the mortal coil. This is still a cosmological trade off between organismic emergence through sexual recombination and sexual reproduction, individual variety and organismic mortality. Misfortune would be entirely different if we could simply regenerate parthenogenetically.

John: If I consider what perspective might be behind your comments on karma it seems that one concern you have is that Vedanta is not as scientific as I might wish it to be - is that a fair restatement of at least one concern you are expressing? If so, then I am indeed applying a new science framework to interpreting Vedanta; whereas it may not have had that same understanding before this attempt at formalization, although that is philosophical archaeology and we know that effort and all arguments for and against will remain speculative. I'm not so concerned if the ancient Rishi's had it all right. Initially, Vedanta didn't figure into the theory at all. I was astonished when I found the correlation and I find it highly improbable that such a similar result would not come from similar thinking. But then I think you are also saying Vedanta was wrong and in some way both my description and Veda suggest an "overdetermined" model, or perhaps two.

Certainly the mechanistic reductive mainstream view is overdetermined because it is limited to exact efficient causality. And it does seem that the various religious models derived from Vedic philosophy tend toward a different kind of overdetermination where everything might be imagined to be wilfully predetermined by a supreme being. My model and world view allows both possibilities as contextually determined systems, i.e., as special not general systems. The general turns out, if anything extreme, to be underdetermined and the theoretical challenge is to explain how things get determined. Reintroducing the higher causes to material models makes them less deterministic. Also when higher cause is claimed to be omnipotent, introducing physical causality lessens its wilful determinacy. The holon model looks at both and how they work together as a complex causal system.

Chris: The reality of human socio-religious morality is that it is a layered cake, in which world leaders, from Putin to Netanyahu and Trump can be as narcissistic and psychopathic as they like. They can fire nuclear weapons and commit genocide on their opponents, or even destroy the late planet Earth in spite. They can also out-reproduce any male in existence. Tamerlane kept 10,000 virgins behind flaming walls and 0.2% of the human Y chromosomes on Earth are those of Genghis Khan. At the lowest extreme, from the innocents of Gaza and the Rohingya, to the lower gang prospects of El Salvador and Ecuador are all underprivileged delinquents, having to break the rules to survive, driven naturally by low serotonin, including committing indiscriminate theft and murder. Sandwiched in the centre, the middle classes reinforce morality as a form of "altruistic" punishment because they have enough resources to lose and they survive through keeping the balance towards social order.

The entire purpose of this moral edifice is to keep dominant societies dominant by inhibiting intra-social strife, while allowing as many social bluffing niches as possible, which is what smart social societies do to survive. We see exactly the same picture sexually in the Lakshmi temple of Khajuraho, where sexuality is regal in the sacred maithuna of the upper pinnacles, while sodomy and bestiality “run free” on the lower earth-bound strata. This twisted anthropocentric view of cosmic morality has been abused by religions East and West to reinforce the least spiritual aspects of belief, in the social dominance of major world religions, from Zoroastrianism, through Judaism, Christianity as the imperial religion of Rome and Islam of the Arab world, not least to Hinduism and the holy war of the Gita. There is really no exception, since the emergence of shamanic animism to this tragic tale, which is why I stand as a "noble savage" with nature in all her vulnerability and splendour. Therefore to reinstate karma as an additional force, even for good, is to assert a form of over-determinism, which resembles autopoiesis, in being hypothetical laws of agency, in addition to the laws of physics, which themselves amount only to homeostatic survival, just as Karl Friston claims in free energy

minimisation in the brain. These do not solve the hard problem of consciousness, nor do they even address the problem of conscious intentionality over the physical universe and hence “karmic” responsibility.

Symbiotic Existential Cosmology turns both the Eastern and Western religious traditions inside out and utterly transforms the physical universe as well, by giving it back its conscious meaning. Rather than a Vedic universe running downhill because of defection into the Kali yuga, propped up by endless cycles of reincarnation, in which humans and animals are just conscious sentient beings with no natural cosmic-biology, or a Monotheistic Eschaton following a divine "creation" tragically flawed by sin, in which the late planet Earth is committed to the cosmic incinerator in favour of an illusory heavenly Jerusalem, SEC says the entire universe is a psycho-physical cosmos in a state of becoming, in a creative critical phase transition at the edge of chaos, giving rise to life evolving into conscious existence which can rise to overflowing in paradise on the cosmic equator in space-time, if we don't cause a precipitate Fermi extinction. This passes all the responsibility back immediately and directly to us as cosmic-conscious biota protecting life in the universe, rather than a fictitious deity or illusion of emptiness full of sound and fury signifying nothing or bliss for bliss's sake alone.

SEC came about from a moksha experience, which transcends individual souls in the merging with ultimate reality that the Vedas call Brahman. But pivotally this meeting showed that Brahman, as cosmic consciousness, is as vulnerable as we are as mortal organisms, because without us incarnate conscious organisms keeping the fray in the centre of the cyclone of mortal existence, eternal psycho-physical cosmic consciousness cannot become manifest. And we don't yet know there is life elsewhere in our galaxy or even the universe, so we need to take full responsibility for the fate of Terra-Gaea. We know this to be true because all knowledge of Brahman comes from deep samadhi and moksha experiences of the rishis. This tells us a lot more things. Reincarnation is an illusion promoted because of the sheer scarcity of true moksha. Individual souls are an illusion of the notion of eternal life when liberation comes from union with Brahman, not from eternal dislocation of angels dancing on the heads of pins. Moksha is not biological death because we step outside the bubble of mortal existence into the ocean of cosmic Brahman, while still being the biological conscious beings we are incarnated to be and thereby realise our calling in protecting life throughout the universe so that it can truly flower, in the "Net of Indra" for want of a better word.

The tragic fallacy of the traditions, both Eastern and Western and of physicalist science, is that all of them neglect the central role of biological life as the central cosmic tree of immortal consciousness, through which the psycho-physical cosmos flowers to overflowing abundance. You can see it threaded all through the Vedic-oriented discussions, where nature just becomes a synonym for bliss in samadhi. Conscious sentient beings, as described in Eastern traditions, are not only abiological but they are also anthropocentric. An attempt is made to make a direct transition in both Monotheism and Vedanta from the existential crisis of mortality to spiritual transcendence. You once said to me that psychedelics were trying to break down the doors of perception with an axe as an assault on transcendence. That is precisely what spirituality does, by trying to short-circuit psycho-physical reality by leaving biological life out of the sacred loop. This is why I appear to be single-handedly trying to protect the diversity of life against all the odds in a gathering storm of Fermi extinction crises, which no one in these groups has time to even consider, in their passion for spiritual transcendence.

Evolutionary karma in the natural world is a long-term consequence of natural selection and modular mutational change, NOT cosmological morality.

(1) **The Coronavirus Pandemic:** Corona viruses are not moral agents. Evolution simply exploits every possible survival niche cooperative, or exploitative. Corona viruses are the most sophisticated single-stranded RNA viruses on the planet. They are extremely well adapted living symbiotically with bat colonies and infecting other hosts more severely and in humans having an extremely wide spectrum of severity, from asymptomatic to lethal, ensuring their tenacious foot-hold and survival. But they are neither ethical nor moral, just well-adapted survivors. Evolution is not moral and can't afford to be, or we wouldn't have plants and animals, or herbivores and carnivores, parasites and hosts. Evolution's sheer diversity engulfs any moral concept. But there is a karmic sting in the tail of Covid. This has all been caused by exploitative human misadventure, shameless exploiting wild species trafficking pangolins nearly to extinction for their scales and holding civets in cramped cages for their fur, combined with multiple wild bat species packed into urban markets. So Covid-19 has become, partly through human overpopulation and exploitation of the biosphere, a worthy adversary to humanity.

(2) **Entheogens:** Ever wondered why psychedelic species exist? It seems to go right back to single-celled eucaryotes, which socially communicate by what we have come to know as neurotransmitters and receptors. All of glutamate, GABA, serotonin, cAMP, norepinephrine, epinephrine, are found widespread in single celled species. Tetrahymena for example utilises histamine, serotonin, epinephrine, melatonin, and triiodothyronine, as well as peptide hormones, such as insulin, adrenocorticotrophic hormone, epidermal growth factor, endocannabinoids, endorphins and c-AMP and GMP. Now because humans evolved from social amoebiflagellates and our brains develop based on neurotransmitter encodings during neuronal migration, the entire brain is an electrochemical network utterly dependent on synaptic neurotransmitters for its major evolutionary survival modes. This means that other species, particularly plants and fungi which have adventitiously evolved to produce a diverse abundance of myco- and phytochemicals will inevitably produce a scattering of highly psychoactive substances mimicking and tweaking our own psychically active molecules.

No one knows quite what evolved purpose these phytochemicals have, any more than one can speculate on why tea and coffee have caffeine. Some may have a survival advantage in warding off insect predators and others may achieve fertility through providing attractive substances causing consumption by animals. *Psilocybe cubensis* for example grows on the cow pats of Brahman cattle in South East Asia and may have been in turn spread by cattle consumption. We thus owe it to the biosphere that we have not only psychedelics, but cannabis, morphine, cocaine and many essential medicines. Although we know psychedelics are serotonin 5HT2a super-agonists, their effects are wildly different from serotonin and arise from distinct second messenger processes in the metabotropic 5HT2a serotonin receptors. This suggests that the visionary capacity of the human species has always been present and has a function in the visionary experience of our founding shamanistic and animistic cultures. People have noted the presence of DMT in brain samples. Hence psychedelics may open the doors of perception even wider than yogic samadhi exploits in a less sensual way, leading to a philosophy of emptiness rather than the fullness of psychedelic shamanism.

But there is another key aspect **fateful karma**, which is to do with the great leveller – accidental misfortune ... and good fortune too ... **karmic coincidence** ...

There are always two ways of looking at an intervening act of fate such as a disease, storm, flood, fire or accident – (1) the contextual (physical or biological) causes and (2) the exact specific train of coincidences that brought this idiosyncratic event onto being. This is also a fundamental characteristic of the quantum universe stemming from quantum uncertainty. Covid is a perilous disease, so we can try to vaccinate ourselves, or enhance our immune system with supplements to address the contextual risks but this does not protect us from freak occurrences by being in the wrong place at the wrong time e.g. in an unanticipated super-spreading event, so it is as relevant to ask what caused me to catch this now? For this reason, anthropologists acknowledge that an animistic viewpoint has unique survival value, because it does protect from unpredictable threats from intentional agents, even though it may result in overkill on attributing physical causes to conscious agency because everything is treated as alive:

A classic example of this dichotomy is in Evans-Pritchard's description of the Zande rationale for the granary collapse: the Zande knew full well that the granary collapse was "caused" by termites eroding the foundational structures. This physical explanation was, however (in converse to the Western philosophical viewpoint)" - causally irrelevant" to their inquiry, which was, "Which mind intended for the granary to collapse at just this moment?" ... The Zande might not care about universal gravitation or termite biology, they want to know who made the granary collapse at just the moment a friend was under it.

This leads many shamanistic societies, particularly more violent ones, to spend a lot of time casting evil spells to harm others and protective spells to exorcise the evil ones, blood feuds and clan warfare, all in a notion that somehow the universe is able to organically or consciously pull the strings of fate to one or another person's advantage.

This is where the notion of moral karma takes its incorrectly conceived bight into coastline of reality by claiming the universe has a hidden principle of cause and effect that bad people end up with bad outcomes, if not in this life, in the next, combining the sheer difficulty of even good devoted meditators achieving moksha to invoke reincarnation as a way out, with the use of reincarnation as a form of divine punishment in karma. This flies in the face of the evidence. While many bad people have bad outcomes and die in gunfights or receive imprisonment or capital punishment for their crimes, many world leaders and even democratically elected populists display clear exploitative narcissistic or even psychopathic behaviour and succeed on the basis of being "strong leaders", leading humanity as a whole to the brink of annihilation. Worse still, the vagaries of fate do NOT protect the innocent or even the transformatively beneficent. Karmic fate is rough justice.

What I do conclude out of this is that subjective consciousness has been retained by evolution since excitable eucaryote cells became whole brains because it has a selective advantage surviving in a world of environmental uncertainty that is ultimately a product of quantum uncertainty so taps into the very phenomenon the proponents of moral karma incorrectly claim exists.

But from my point of view, in an alignment with Vedic thinking, my own experience of moksha teaches me to avoid any form of karma that is not directed to the highest goal, which in my experience is convincing humanity to protect the immortal diversity of life as our *raison d'être*. I will do this as assertively as it takes as a spokesperson for the edge of chaos using controversy to provoke and hold no quarter with criticising cherished religious and scientific notions which I perceive to be acting to undermine this paradigm shift.

Psychedelics ARE a faster route and have a much more experienceable transfiguration than meditation alone, but it still took me to the age of 78 combined with deep meditation similar to TM to generate an experience iconic enough to produce Symbiotic Existential Cosmology. This work is frankly so oddball and yet so tenaciously robust scientifically that it is a proof of principle of something powerfully karmic. I was prevented by acute closed angle glaucoma from taking any trips for seven years previously, until I had total lens replacements. This caused a very pure whiplash on a very mild dose, so you need to see it as a confirmation of what I just called **fateful karma**.

I am trying to convey the positive potential of entheogens to deal with Fermi catastrophe and I'm caught in other karmic tender traps. The whole Western tradition of Christianity is sacramental, so this is the Biospheric Eucharist of life rather than the soma and sangre of Yeshua's death. It was discovered in deep meditation in a meeting ostensibly with Brahman as ultimate reality, so it validates Upanishadic Vedanta and the yogic tradition. It was discovered using a sacrament 3000 years old coming from Precolombian America, affirming the shamanic sap and dew. Now doesn't that strike you as a karmic hat trick for the three great spiritual traditions? I may be here to challenge the law of and religious doctrine but I am NOT here to destroy the prophets, but to fulfil the future of life immortal.

Empiricism, the Scientific Method, Spirituality and the Subjective Pursuit of Knowledge

Firstly: What is empiricism and what is an experiment?

empirical: based on, concerned with, or verifiable – by observation or experience – rather than theory or pure logic.

From Greek *empeirikos* "experienced," from *empeiria* "experience";

experiment: An action or operation undertaken in order to discover something unknown, to test a hypothesis, or establish or illustrate some known truth. From Latin *experimentum* "a trial, test, proof, experiment," from *experiri* "to try, test," from *ex* "out of" + *peritus* "experienced, tested"

The two notions – **observation** or **experience** – came from Greek physicians making diagnoses by observation or experience rather than theory, sometimes with the disapproval of theoretically oriented physicians, who treated them like the medieval barber surgeons. But empiricism's role has become pivotal in experimental science, without which modern medicine would not exist.

When we come to the mind-brain / consciousness-universe complex, the pursuit of knowledge inherited from Greek medicine gives us two asymmetrically complementary approaches to the pursuit of knowledge.

(A) Objective verification by empirical observation: this is the standard basis of good experimental science and is based on replication – two or more experiments producing consistent results.

(B) Subjective affirmation by empirical experience: The word affirmation is used rather than verification because, to replicate a subjective experience requires two or more subjects mutually affirming they have experienced consistent phenomena. This discovery process is by definition experientially experimental.

The status of (A) is the gold standard of objective scientific inquiry and is also critical for experimentally verifying theories like quantum physics and relativity, but the status of (B) remains unrecognised, as the other half of the pursuit of knowledge of the cosmos as a whole, along with its experimental protocols.

Both approaches can achieve statistical significance. For example subjective reports collected in a scientific context become consistent observation of reported conscious experiences by an experimental group. But experiential validity can also be established by direct mutual affirmation.

Secondly: The role of conscious volition.

I have posed the question: "*Do you agree that you have **subjective conscious efficacy of volition over the physical universe?***" I asked you this because it's the most obvious property that we all possess in common, even to eat or secrete, let alone have a conversation, which we all do, or to do something creative. Yet it poses a unique existential threat to materialists, who try every conceivable way to plead that correlation is not causation, or that there is always a hidden brain mechanism doing it, although that directly contradicts our own veridical perception of our intentional acts as having been intended by ourselves.

However, once we mutually affirm the root empirical experience that we ARE physical beings, intentionally shaping the world around us, and perceive ourselves to be doing so, just as other mammals we observe do, we have an emerging subjective consensus that becomes a root experiential scientific discovery.

Many people look at this and say it's too easy, as a solution to the hard problem, to simply declare we agree we have volition, that it's facile, or maybe just expressing our fallacious impressions, but it's actually the very foundation of establishing the subjective pursuit of inquiry into the knowledge of the cosmos as a whole and the conscious dimension many of us call, for want of a better word, spirituality.

The reason this criticism is wrong is that volition states the obvious easily, while consciousness became sequestered as a hard problem, because of epiphenomenalism, which a priori contradicted the efficacy of volition without evidence, while paradoxically admitting we were conscious of the world around us and even of dreams and hallucinations, as a brain-derived internal model of reality. The casualty of this cancellation culture was volition. Hence volition – now stating the obvious – IS solving the hard problem and it is observable. It's how we know one another are conscious, through our vivacious volition, and it's how we understand other animals are conscious too. This is the reverse Copernican principle as an axiom of affirmation.

Thirdly: What IS the foundation of the subjective pursuit of knowledge? Experience itself!

Techniques of subjective empiricism and experiment are as different from observational empiricism as the physical universe is different from consciousness itself, yet complementary to it. They need to be approached as a whole because we engage consciousness as a whole not in its pieces. The subjective aspect is not adequately explored by trying to analyse it or decompose it observationally, or abstractly, because it is everything we experience. We are in it, and transforming it, not just observing it. So the techniques of simple introspection are inadequately general and also flawed because the mind can't be fully observed, since observation changes it. But it CAN be fully experienced and that's the core principle of the inquiry process.

We can only begin to form an understanding of the subjective by embracing deep conscious and mystical states, untethered from the physical world, not by attempting to analyse them, or qualia, or the thought process, but by going right into deep conscious states on a vision quest into the 'other' side of being and returning with an epiphany, or a satori, or a moksha whose nature we can meaningfully share with others as a discovery process. Talking about subjective experiences remains anecdotal unless and until two or more of us are able to affirm deeply common qualities of such experiences together.

[Symbiotic Existential Cosmology](#) (new web page) as a product of entheogenic quantum change, reinforced by recent psychedelic research, and Chris Field's [research insights provoked by meditation](#), are examples of such experiences giving rise to new testable hypotheses, playing a key part in this process.

Fourthly: Caveats. Central to the problem of subjective discovery is that:

- (1) The subjective domain is dominated from above by the **confining processes of rational thought and verbal argument**, which places a filter unless a proposition can be successfully argued, rather than two subjects agreeing on a consistency of experience. This is not only unnecessary but leads to the entire description being only that of

cognitive thought. This is a real problem for philosophy of mind to address and come up with a paradigm shift about. "The way that can be told is not the countless way" as Lao Tsu pointed out.

- (2) The subjective domain is dominated by **real world consciousness**, when this is subjective consciousness locked in perceptual and volitional relationship with real world events, again acting as a severe filter on what consciousness actually is. It needs to be compensated by realising the full depth of untethered conscious experience going to whatever measures are required, including last but not least, sacramental exploration, which forms a subjective complement to the LHC.
- (3) Deeper levels of 'pure' consciousness uncoupled to the rational and real world filters are broadly: (a) **dream or hypnagogic experience**, (b) **meditative and contemplative practices**, (c) **entheogenic sacramental experience**, (d) **religious ecstasy** (e) **near death experiences** and (f) **paranormal phenomena**. The deeper of these can be very difficult for individuals to fully experience, leading to mystical states having a quasi mythical status, in which moksha and samadhi cannot necessarily be achieved in a lifetime. Entheogenic states are critical information to the subjective discovery process, without which no valid conclusion can be drawn, and so these urgently need to be more fully explored and accepted as central to the discovery process. Each of the mystical states need likewise to be explored fully by mutual affirmation at the root level before their status can be considered to reach the level of evidential support.
- (4) **A priori beliefs are by definition inconsistent with the free pursuit of empirical subjective knowledge of cosmic reality**. The empiric method's foundation eschews theoretical assumptions that are not prior-evidential, so that reality itself can be explored and understood as it is. For example relativity wasn't prior-evidential until Eddington's unbiased experimental verification using a solar eclipse. Religious beliefs fall into this category of not being prior-evidential, as open questions, so the conditions of religious ecstasy have to be carefully negotiated to separate belief from transformative experience and recognise that genuine quantum change signifiers are the gold standard of any mystical experience, not the conviction of belief.

Fifthly: Freeing the Core Quest

The pursuit of knowledge of the subjective realm doesn't have to solve analytical questions about phenomenology, such as the binding problem which is an easy problem of consciousness to be elucidated in the prospectively quantum dynamics of the brain. Likewise the nature of qualia, such as the difference between visual and auditory experiences and the synaesthesia between are also likely candidates for understanding through extended brain dynamics such as work on quantum neural networks (Fields et al. arXiv:2201.00921) and the different kinds of encoding required for developing a coherently co-bound internal model of physical sense modes. This is simply acknowledging that, while we do have conscious physical volition which we fully experience, we do so acting as transformative agents in possession of an exceedingly awesome experiential constructive filter called the biological brain, whose key role is to provide a physical realisation of our volitional conscious existence. It also means panpsychic theories don't need to solve the qualia problem or the combinations problem for the subjective pursuit of cosmic knowledge (see Fields 2021 [JCS](#)).

"What we have within us will save us if we bring it forth from ourselves"

Our quest and the cosmological quest is to accept the deep experiential abyss we have within us as consciously experiencing volitional agents and bring it forth from ourselves in the discovery process we engage together, because what we do will save us and humanity.

The Manifestation Test

The manifestation test is a succinct way of critiquing all pure materialistic explanations that form a physical or objectively abstract model of conscious experience. When we talk about a dream or a vision, or I affirm to you that I am a subjectively conscious agent typing this passage, this is a statement consciously manifesting my assertion, from my stream of consciousness. Unless I am a zombie, it is thus a physical record of a conscious experiential agent. The key thing about consciousness being primary is that we experience it all the time and we can, by the universality of our own conscious experience, accept that others performing volitional activities as conscious agents are also manifesting this root subjectivity, that is also key to the Vedic perspective and all spiritual notions.

When we develop a model viewing consciousness and its experiential phenomena from the outside, we are making an abstract objective description about a system. This may initially be conceived consciously as all creative notions are, but it is asserted to be an objective description we can view from without, so it stands outside in the real world, or in

an “out there” abstraction of it. The trouble is that no such model manifests subjectivity or exists subjectively in any way, so it can't be a description of primary consciousness.

Some descriptions are not like this. When the Huichol describe the nierika, they are describing a conscious portal into which we can consciously enter and from which we can return transformed so it is “in here” as a conscious journey. Most creation myths are also like this. Shakti and Shiva are not just out there – the description is also “in here” in Shiva and is showing how the "in here" became ramified into all our individual “in-heres”, so it passes the manifestation test. There could be good explanations like the holographic principle that might likewise make a kind of description of an integral transform like relationship between the universe and the cosmic mind that would realise this kind of relationship, so a description that passes the manifestation test is possible in principle.

Necessary and Sufficient Cosmological Meaning

Necessary meaning is the kind of meaning that, if we understand the universe sufficiently, as we must needs, we apply to unfold the realisation of the cosmological condition.

The core necessary meaning is to protect the survival of the conscious biota over evolutionary time scales, to unfold an emergent cosmological climax and hence also facilitate our own survival.

Sufficient meaning is the meaning we apply through conscious volition in our own realisation of our discovery process to creatively adorn reality.

The entire sufficient meaning is a free creative process, weaving the music of consilient history, celebrating our immortal genealogy and plumbing the cosmologically conscious abyss.

Appendix:

Primal Foundations of Subjectivity in Symbiotic Existential Cosmology

This section arose from an ongoing debate about Symbiotic Existential Cosmology in two expert groups. It begins with an extensive set of questions and critiques about the nature of Symbiotic Existential Cosmology in terms of primal subjectivity and its emergent consciousness, and how this is elaborated in SEC. It leads on to debates about SEC's relationship to the Eastern wisdom traditions, especially Upanishadic Vedanta, with which it has clear parallels, and with Buddhism, as cosmologies of conscious existence.

Symbiotic Existential Cosmology seeks a new, paradigm transforming, existential tradition, which differs from both the Monotheistic and Eastern traditions, in which the immortal evolution of life and its diversity is accepted as the climax condition of the living universe, which is its primary sacred manifestation, to be protected by mortal sentient beings, so that the immortal passage of the generations of conscious life can flower and humanity as a species can survive.

This is a radical departure from both Monotheistic traditions, where God is sacralised as supreme and Eastern traditions where enlightenment itself is sacralised as the central goal. SEC considers moksha to be an accessible experience, without resort to theories of reincarnation to achieve it over many lifetimes, due to the evolution of the entheogens, so it forms a new 'religious' tradition, fully consistent with both enlightenment and scientific cosmology. Rather than seeing enlightenment as pure spiritual or conscious transcendence, it is the ultimate climax form of symbiosis, in which cosmological subjective consciousness becomes fully manifest in the natural physical universe and in which safeguarding the diversity of life in the immortal passage of the generations is realised as the *prima facie* manifestation of conscious symbiosis with the biosphere, rather than an imaginary eternal elite spiritual realm.

Symbiotic Existential Cosmology invokes a hybrid concept – Darwinian panpsychism – that sets it apart from all other forms of cosmology and panpsychism and resolves the issues raised below and many others.

Darwinian panpsychism with two components:

- (1) **Primitive or primary subjectivity**, which is a germinal form of cosmo-panpsychism complementary to the physical universe at the foundation level.
- (2) **Emergent consciousness** which arises from a unique topological bifurcation precipitated by the eucaryote endo-symbiosis, in the edge-of-chaos excitable cell membrane becoming freed for sentient attention and social signalling through the core electron transport pathways driving photosynthesis and respiration becoming sequestered in the mitochondria.

This resolves a string of problems about panpsychism and physical materialism:

Firstly there is no issue about how the pieces of panpsychism fit together. What has happened is that the usual determinism of classical materialism has become replaced by a physical contextual filter defined by neurodynamics, to which primary subjectivity seamlessly adapts as its complement.

This means the problem of how panpsychism is built up out of functional parts (combinations problem) becomes meaningless because it is the complementary neurodynamic filter which determines the way things are divided up. Each physical brain creates an objectively defined encapsulation of primitive subjectivity, functioning as a boundary filter on it rather than causally determining it, leaving a "cubic centimetre of chance", as Carlos Castaneda (1968) put it, to allow conscious free will to intervene, through quantum uncertainty and its ramifications in wave function collapse. The same thing for the decombinations problem because cosmic consciousness is not subdivided to make other forms of consciousness e.g. in organisms, but arises from the coupling with the boundary constraints.

Why and how it is divided is determined by the physical filters imposed by brains, all living systems, edge-of-chaos dynamical systems like hurricanes and quantum uncertainty at the fundamental level.

The problem of emergence is solved because it is determined by a unique topological transformation unparalleled in the universe's evolution, setting up a completely new kind of dynamical system directly responsible for making neurotransmitter-based attentive quantum sentient consciousness possible.

Finally it solves the cosmic consciousness vs organismic consciousness problem in that deep meditative and entheogenic states of moksha samadhi become asymptotic to a universal form of consciousness, in which the specific constraints of individual sentient consciousness, become released and approach universal forms, abstractly reflecting the universal condition. The videos of [apparent REM in sleeping baby spiders](#), and related evidence in octopi indicate a high degree of commonality in the conscious dynamics of nervous systems as different as humans and arthropods, suggesting the foundations of consciousness are universal to all eucaryote cells linked in edge-of-chaos networks.

There are cosmological arguments that the nature of nucleotides and proteins, as core molecular systems and the ensuing complementarity of archaea and bacteria as metabolic strategies are intrinsic to the structural and continuous forms of symmetry-breaking that gave rise to the standard model of physics, making the entire process, including the eucaryote endo-symbiosis, foundationally cosmological in nature.

Ram Vimal: Why do you prescribe/use entheogenic drugs instead of normal meditation techniques for altered subjective experiences (SEs) as they are dangerous to our system?

Chris: Because they are fully developed experiences that have profound insightful effects on a person's world view and lead to definitive visionary experiences identifiable with moksha, while meditative experiences tend to create a peaceful mindful or compassionate state that is less than revelatory, which explains why moksha is so hard to achieve without entheogens. They are not at all dangerous when used responsibly.

Ram: You said: "In the panpsychic description, uncertainty is not irreducible randomness but is a measure of deep quantum entanglement, complemented by the subjective aspect." Are you referring to objective uncertainty (as in quantum fluctuations) or subjective uncertainty due to the experimenter's ignorance? Why is uncertainty a measure of deep quantum entanglement? Is there any reference?

Chris: Only to Symbiotic Existential Cosmology where this possibility is [discussed in detail](#). Quantum transactions are like a non-linear plasma-to-solid phase transition across space-time where a plasma of free offer and confirmation waves collapses to become a set of real emission-absorption interactions possibly with some residual outliers. We don't yet have a model for this, but it's neither time-forwards, like an offer wave, nor time-backwards, like a confirmation wave, but transversal to space-time (transcausal). So instead of simple decoherence, we have a contextual collapse defined by all participants in the world-view, which could be the entire biocosmos. This also links in a way to a form of super-determinism which is also context dependent measurement and doesn't deny free-will.

My position on uncertainty is that pure randomness does not exist in the physical universe, because all instances of uncertainty are either directly or indirectly quantum in nature, derived ultimately from quantum processes. Ignorant randomness is thus deferred quantum uncertainty or simply a stochastic model of a partially obscured process. So an experimenter has ignorance until they make a quantum measurement but quantum uncertainty performs the informative act. Similarly accidental circumstance is a product of underlying quantum uncertainties that we call karma. So if I walk round the corner and nearly get run over, but escape, or Nelson looks through his blind eye in the Battle of Copenhagen, world history is made from superimposed possibilities, expressed dynamically in the real time conscious decision that reduces the world of potentia to the line of real history we experience in the so-called "classical" world – a process I call "historicity".

It's just a poetic spiritual allegory of climactic "creation" from within, but here it is. The universe is a process of becoming, so just as we have a cosmic origin from symmetric simplicity and then cosmic symmetry breaking, from a unified super force, so we have a vestigial germinal form of primal conscious subjectivity associated with it. The notion of a fully developed cosmic mind at the beginning contradicts the becoming and the climax fulfilment of the natural sentient universe, becoming conscious of itself in symbiotic organismic moksha. Primal subjectivity provides the germ of Shiva in a form of conscious "spermatogenesis" for Shakti as the enveloping mother liquor, to play into in all her physical manifestations and subdivisions, as the developing zygote elaborating into the diverse forms of organic conscious experience life produces.

This way, instead of running down into the Kali Yuga or the Buddhist Samvartakalpa, or Eon of dissolution, or being static as in the Monotheist creation, which is then discarded in the End of Days, the universe explodes with evolving

living diversity in Paradise on the Cosmic Equator in Space-Time! It's more than the noosphere, it's the biocosmos revealed – **Voilà!**

Ram: How do you reconcile no-self (*anātman*) and self (*ātman*) hypotheses?

Chris: I adhere to the Upanishadic notion of self. I see the Buddhist view of no self as eliminating the jewel in the lotus in favour of an empty void, when our living journey is across the incarnate “Styx” of the mortal coil in real time, although the we also know the self is also an experiential construct, like our sensory perceptions, so it's not absolute or unchanging. SEC, as a subjective path of realisation, embraces life and symbiotic relationship with the diversity of life and sees moksha as liberation from eternal angst by accepting that biological mortality in the real world is the psychological antidote to the suffering ego, because the only acts of any accruing meaning are to give our selves back to the enrichment of life and consciousness as a whole and its ongoing unfolding, while experiencing moksha and appreciating living fulfilment along the way. Moreover SEC sees cosmic consciousness and the ultimate self associated with Brahman as a super-conscious state asymptotically convergent to the cosmological foundation of conscious processes, that arises from the biota as a climax manifestation of cosmic becoming, when freed from organismic constraints.

Ram: You said: “The action of mind on brain necessarily arises from modulating the “random” aspect of quantum uncertainty in edge of chaos brain processing. This enables volitional will to intervene in the brain without disrupting the partial causal closure in brain processing in the uncertain quantum universe. In this sense, classical causality is replaced by quantum consciousness. It provides plenty of room to affect the computationally-intractable uncertain outcomes in evolutionary survival, using both subjective anticipation inherited from single celled eucaryotes a billion years before neural systems evolved and historical experience generated by cognitive processes.”

Since your framework is ICAM (interactive complementary aspect monism), but the action of the mind on the brain (also called mental causation) can be easily instead explained through inseparability instead of problematic mind interacting with a brain, that makes a category mistake and is based on interactive dualism.

Chris: No it can't be so easily explained – inseparable dual aspect is equivalent to mind-brain identity theory because there is no interaction between *s* and *p* states at all! Without interaction you simply have physical processes, with neither subjective consciousness even of perception as an *s* state nor any hint of volition, because the *s* states are just dual ghosts in the machine, having no action of their own and the physical universe is causally closed except for uncertainty, to which you appear to accept as a random process.

Ryle's attempt to formulate duality as a category error led to reductionism and is effectively proven to be a category error itself, due to the inability of materialism to address the hard problem of consciousness extended to volition:

Gilbert Ryle's (1949) claim is that “mind” is “a philosophical illusion hailing from René Descartes, and sustained by logical errors and ‘category mistakes’ which have become habitual”. Ryle rejects Descartes' theory of the relation between mind and body, on the grounds that it approaches the investigation of mental processes as if they could be isolated from physical processes. The rationalist theory that there is a transformation into physical acts of some purely mental faculty of “Will” or “Volition” is therefore a misconception because it mistakenly assumes that a mental act could be and is distinct from a physical act, or even that a mental world could be and is distinct from the physical world. This theory of the separability of mind and body is described by Ryle as “the dogma of the ghost in the machine.”

SEC negates Ryle's trap by asserting interactive complementarity in which mental acts are not “distinct” from physical acts because complementarity doesn't allow complete distinction. In Ryle's view, the entire concept of mind is a category error, so we only have the literal “lemon on the table” and no mental impression that you call qualia. Inseparability is equivalent to indistinguishability and the mental states and acts become equivalent to physical states and acts. Wave-particle complementarity is not like this. The two aspects are necessary and not indistinguishable, but partially separable and interactive. For example $E = h\nu$ connects the particle energy to the wave frequency and $\Delta E \Delta t \geq h/2\pi$ couples the two in quantum uncertainty, effectively through wave beat counting. Quantum electrodynamics describes the electric field in terms of real and virtual particles, but does so through the wave propagator. The wave and particle views are separable, but mutually exclusive.

Ram: It seems that SEC proposes Free-Will. However, one could argue that the Will is not totally free; instead, it is semi-Free-Will as elaborated in (Vimal, 2010h). We make decisions based on many factors in our mundane lives.

Chris: I didn't "propose Free-Will". Free-will is a concept in wide cultural currency for intentional will possessed by the experienter. The term free means the capacity to have volition free of complete determinism:

Free-will is "the power of acting without the constraint of necessity or fate; the ability to act at one's own discretion (Oxford Languages).

It doesn't mean we can will anything out of the blue and is always contextual on defining boundary conditions in the physical universe. However in quantum form, will is particularly free because the probability of finding a particle is simply determined by the wave power so if we normalise space over the wave amplitude, we have a dynamical phase space in which the particle can appear anywhere with equal probability. It thus has total freedom of will within this space. Therefore calling free will semi-free is superfluous and contrary to its actual definition.

Ram: You said: "Conscious experience is our sole avenue to know and understand the physical universe: Although we have to respect the fundamental nature of physical existence, to survive in the world, the totality of our knowledge of the physical reality of the world around us is established exclusively through our subjective consciousness, as a consensual experience of conscious participants, complementing our individual dreams and visions".

The above scenario is better described through the principle of inseparability (POI) instead of the principle of complementary (POC) because in the former (POI) the s and p aspects are simultaneous and in the latter (POC) they are not. For example, particle and wave cannot be measured simultaneously so they are complementary to each other. However, subjective experience (SE) redness is experienced and its NPB is measured simultaneously so they are inseparable.

Chris: This is untrue. Conscious experiences require a sustained global brain dynamic. Both of these happen over time periods, not instantaneously. There can be no conscious volition over the universe unless s and p are interactive.

Entheogens and their Role in Social and Spiritual Transformation

Ram: You said: "This type of deep psychedelic experience has deep parallels with the mystical states of moksha, satori, epiphany, immanence and enlightenment spanning both Eastern and Western spiritual and religious traditions and planet-wide traditions of shamanism. ... In the Upanishads it is accepted as the ultimate reality in the union of Brahman with the atman, or inner self, in the manifestation of cosmic consciousness. ... This provides evidential data, in the form of veridical reports having statistical significance in the same way that objective scientific measurements do. This places psychedelics as the subjective complement of the LHC in physics. ... Symbiotic cosmology provides a completely different solution from both a purely materialistic cosmology, in which the universe is described as a causal process, in which consciousness life is passive, meaningless and irrelevant; and a theistic cosmology in which life on Earth is a disposable moral trial created by a non-evidential external third party called God for a future life of eternal bliss or hellish punishment. Both these cosmologies devalue the role of the evolving diversity of conscious life perennial in the universe, leaving us with a wasteland of apocalypse and Armageddon. Symbiotic existential cosmology invokes immortal paradise, so long as Earth shall live and beyond Earth to the stars, if we can learn to survive in evolutionary time. It is the real cosmology of the living universe while religious and materialistic cosmologies are tragic fallacies of the imagination."

All experiences at all states of consciousness including altered states (such as samādhi, mystic, and mokshic states) are simply subjective experiences (SEs), which must have their respective neural-physical basis. The SEs of external objects have physical reality, but endogenously generated SEs (with ego-dissolution) such as those related to samādhi, mystic, satori, and mokshic states may not have physical reality. Therefore, it is unclear why SEs related to such altered states can be called cosmic/universal/primary consciousness and reveal ultimate reality. Critiques could argue that they are simply phosphenes (endogenously generated SEs without any physical reality) with respective NPB and may not represent the ultimate/fundamental reality.

Chris: Psychedelic experiences are fully enveloping synesthetic and somato-sensory identity-transforming multi-dimensional visionary experiences, not just superficial visual disturbances like phosphenes. I referred specifically to psychedelics, but your reply selectively omits them "altered states (such as samādhi, mystic, satori and mokshic states)". Why are you eliminating entheogenic ones? Your argument suggests that all forms of subjective experience apart from physical perception are unreal. Cosmos and universe are two different terms. Non-perceptual conscious

experiences are veridically real to the experiencer. They are neither imaginary nor hallucinations. As conscious experiencers, we can compare our experiences and affirm their veridical status. The reality of such states are a foundation of Eastern philosophy and the Upanishads. Psychedelic states in particular involve both experiential overload and ego-dissolution. In states of meditative withdrawal, this allows the brain dynamic to asymptotically approach a state where it is experiencing inner subjective reality freed from perceptual boundary conditions. This creates a unique context, where the most complex intelligent conscious system in the universe is experiencing its own evoked inner identity and the ground of conscious being. Cosmic means "of the cosmos" not "of the universe". We simply have little or no idea at this point of the reality status of the subjective cosmos, although the Eastern tradition has been endeavouring to explore it for centuries through rare instances of samadhi. Psychedelics provide another more direct avenue linked to the billion year evolutionary foundation of the sappy neurochemical brain. We certainly don't have any valid basis to assume any non-perceptual experience is unreal, or unlinked to the history and future of the universe, including dreaming states, so we urgently need to explore these empirically.

Ram: Critiques could argue that the subjective experience (SE) of unity between the subjective self and the objective world could be hallucination due to entheogens, which may cause a fatal accident during driving if the red stop light is unified with the driver. How do you rule out hallucination because of the ingestion of mushroom?

Chris: You have to determine if you think visions are hallucinatory yourself in the first person. Some things are illusory and some veridical. Only the experiencer can fully decide. Some things may seem to be irrational notions that one was fantasising and then they come true. Others, like the notion of spirit beings, I perceive as veridical on entheogens, but they might be just insubstantial visions, so need to have a contingent status.

Serotonergic entheogens don't induce hallucinations as such. They can induce powerful visions, particularly DMT, but one can always distinguish the real world from the dream time, unless one is lost in contemplation. You shouldn't drive on mind altering substances, but you simply can't drive a car in an egoless state. You have to distinguish the real from the visionary. On entheogens, you have to go into a state of meditative withdrawal to dissolve the ego by removing sensory distractions e.g. lying in a darkened room, reducing the distinction between self and world and practicing self-annihilation. It takes the same time and effort as yogic meditation. I said very clearly that moksha is an organismic state asymptotic to moksha, just as Aurobindo describes the super-mind as a transitional state.

Visionary experiences are like waking dreams, described as veridical because the experiencer perceives them to be real rather than imaginary, although they can distinguish them from real world perception. They can be very ornate and can be looked at in great detail as if one is perceiving a real phenomenon "out there". They are like phosphenes but they are visual, auditory, olfactory and emotional and interior to our identity. So they can become all-encompassing and distract us into day-dream like ongoing visions that prevent samadhi, so they are a handful to negotiate. Dreams and psychedelic visions are definitely "in here" because they are private subjective experiences that cannot be identified with a physical entity, but they are perceived to be in subjective reality "out there", say for example, around 10 - 30 feet away, as a shimmering, moving kaleidoscopic 3-D pattern one can look at intently.

Ram: It is unclear if the unity SE due to ingestion of entheogens is really the moksha state because, at this state, karmas are supposed to be nullified.

Chris: It is even more unclear that yogic meditation leads to true moksha due to a lack of evidence. Entheogens are also supported by quantum change studies reporting "genuine spiritual experiences" during ego loss. The only thing I can say about this is that moksha for me is a really straightforward state of disembodied consciousness that is just like the proverbial NDE of meeting the cosmic self who communicates by telepathy, and imparts to you the covenant to return to your incarnation and fulfil your karma, in my case to save conscious life throughout the universe before I go. I am thus freed from the round of birth and death because I have seen incarnation from outside and know in my bones Brahman's advice to do this is the right course. I can take another trip but I don't need to and to ask again and again for confirmation will be a corruption of the covenant. That said I have had two trips since and will probably have more just for the insights. That's why I am so certain that this is real because it frees one from mortal angst that drives the whole notion of reincarnation.

Ram: I know the use of MDMA (ecstasy) and cocaine may cause harm.

Chris: MDMA can cause harm by burning out one's serotonin transporters and possibly dendrites, although the evidence is clouded by bad science. Chewing coca is not harmful, but chemically concentrated impure illegal drugs produced by criminals are. Psilocybin and mescaline and DMT are no more harmful than food, but you can't keep taking them or they don't work until you take a week off. They are controlled substances to avoid the disintegration of consumer capitalism in favour of nature mysticism, essentially because Western society has no established traditional approaches to use them responsibly. Brazil has some big ayahuasca church congregations with tens to hundreds of thousands of members.

Ram: Ingesting entheogens may have toxic effects on the brain.

Chris: That's contradicting the scientific evidence. Serotonergic psychedelics such as DMT promote neural plasticity and neurogenesis. Maria Sabina took mushrooms from the age of 5 all her life and lived to 91. Tellus Goodmorning, my peyote roadman, was still sitting through an all night peyote session at 93.

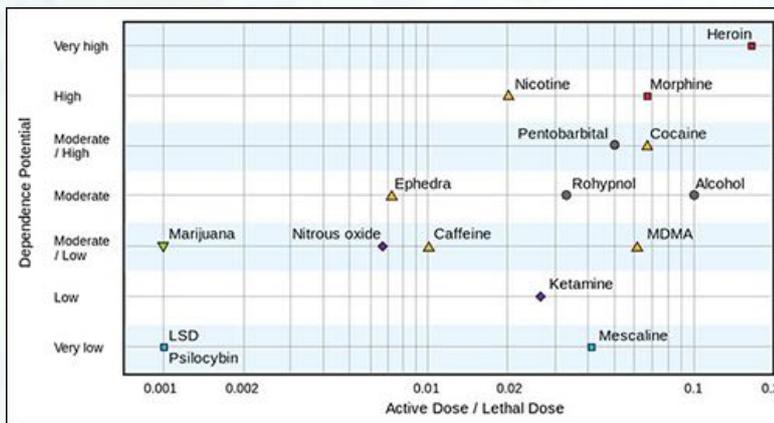

Fig 276: Psilocybin and LSD are the least toxic psychoactive substances known, with a lethal dose 1000 times higher than the active dose.

It is said that Maharaji – Neem Karoli Baba, took LSD. Baba Ram Dass (Richard Alpert) gave LSD to him and it seemed to have no effect. This might make it seem he was so enlightened that psychedelics had no effect on him. However any person used to deep meditation can sit through a psychedelic experience in a meditative state because it is the most natural state to adopt. The Shiva sadhus also do this with cannabis, and

Patanjali acknowledged herbs were a Vedic route to siddhis.

However it takes a good number of psychedelic experiences to begin to understand their potential. Most young people don't have a real clue and just enjoy the transformative distortions, which is fine too but the best way is in a secure protected setting where other people can ensure one is in a peaceful loving state of mind and avoid any anxieties about loss of egotistical identity as well as misadventures in the world at large. My second LSD trip I took 1000 mics and was convinced I wasn't just ego-dead but physically dead as if I was meeting everyone in the after life.

For me mushrooms are different from LSD because they are a living species that is pure and a natural product of evolution here for a healing purpose, whether we like it or not, for our sappy biochemical brains to unfold, to ensure the biosphere can survive. Although they are a much more direct trip to moksha than meditation alone, it has still taken a life of entheogenic use for me to come through with Symbiotic Existential Cosmology. They have been up until recently outlawed because the very effects we are discussing led the powers of consumer capitalism to perceive them as an existential threat to Western culture in the same way the gnostics and witches were to Catholicism. This in itself is profound evidence of their transformative potential on exploitative human culture and why I think they have a key role in healing the biosphere.

Ram: Do all of you agree that the entheogenic route is faster and more immediate because you just need to eat/drink psychedelic drugs and immediately in a few minutes we are in 7th heaven?

Chris: Not so easy. It can still take years, but not multiple lifetimes. Remember that they amplify both illusion and illumination, so take care! Psychedelics ARE faster and have a much more experienceable transfiguration, but it still took me to the age of 78 combined with deep meditation similar to TM to get an experience iconic enough to produce Symbiotic Existential Cosmology.

This work is frankly so oddball and yet so tenaciously robust scientifically that it is a proof of principle of something powerfully karmic. I was prevented by acute closed angle glaucoma from taking any trips for seven years previously,

until I had total lens replacements, which caused a very pure whiplash on a very mild dose, so you need to see it as a confirmation of what I just called fateful karma in my previous email today, which I will attach again below.

Ram: If this is true, then why waste time meditating all life, and even if one decides to invest in lifelong full-time meditation, there is no guarantee that we attain revelation/samadhi/mystic state?

Chris: I am trying to convey the positive potential of entheogens to deal with Fermi catastrophe and I'm caught in other karmic tender traps. The whole Western tradition of Christianity is sacramental, so this is the Biospheric Eucharist of life rather than the soma and sangre of Yeshua's death. It was discovered in deep meditation in a meeting ostensibly with Brahman as ultimate reality, so it validates Upanishadic Vedanta and the yogic tradition. It was discovered using a sacrament 3000 years old coming from Precolumbian America, affirming the shamanic sap and dew. Now doesn't that strike you as a karmic hat trick for the three great spiritual traditions? I may be here to challenge the "law" of religious doctrine – I am NOT here to destroy the prophets, but to fulfil the future of life immortal.

Ram: Do you mean that one has to take psychedelics daily for decades and also do meditation?

Chris: No I don't. I'm just reacting to your cliché about one dose enlightenment. LSD was for me a major pivotal formative discovery process about the nature of consciousness. I am talking about actual scientific evidence of transformative effect. My LSD experiences, from the very first dose, were a real epiphany that caused me to stop being a hack mathematician and write "Unified Field Theories and the Origin of Life" in 1978, which is a clear forerunner to Symbiotic Existential Cosmology. I said I took LSD over 200 times without reaching full moksha. That was over ten years, about once a fortnight, not daily for decades as you said! I have lived with entheogens all my life. I would say about one mushroom trip in two I can get to the promised land using deep meditation as well, where I experience non-ordinary forms of "supermind" reality and as I said they have become my spiritual ally just as Maria Sabina said: *"the mushroom was in my family as a parent, protector, a friend"*. What I did say is that it took 30 years more to produce Symbiotic Existential Cosmology on a moksha epiphany – actually 40 years! And yes, I see dedicated meditation as an essential adjunct to psychedelic induced ego-loss, if you want to achieve transformation.

Ram: If criminals ingest entheogens and have unity SE then it is unclear how their bad karmas will be nullified.

Chris: Moral bad karma doesn't exist. It's a false religious belief in cosmological morality that leads ultimately to the degeneration of the universe in the Kali Yuga. Moral karma makes no sense when the innocent have sometimes horrific outcomes and the exploitative enjoy a good life (not just criminals but disproportionately, billionaires and manipulative world leaders). The results of experiments show psychedelic quantum change shows improvements in a person's whole approach to life, which is "proof" they do reduce negative mentality, because the insights are transformative, even to people with terminal illness.

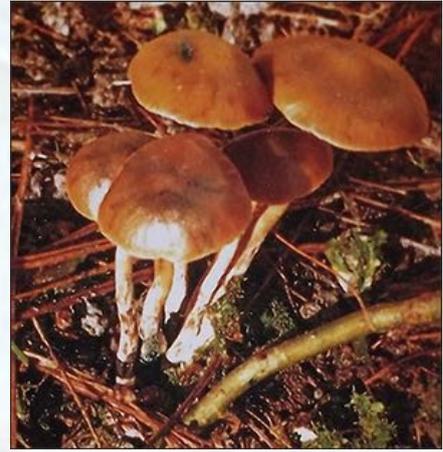

Ram: At the moksha state, individual consciousness Purusha (jivatman or soul), fully separates from Prakriti (substance, universe) and becomes "pure" atman, which merges with Brahman/Purusha.

Chris: Yes that's effectively what happened to me on mushroom meditation, but you are describing it too formally.

Ram: It implies that there should not be any neural-physical basis (NPB), which is part of Prakriti, at the moksha state: this is a testable hypothesis if you have attained this state by simply measuring NPB using fMRI/EEG before and after taking your entheogen such as the psychedelic drug mushroom: NPB_{after} should be equal to NPB_{before} if you have attained moksha state.

Chris: This based on false assumptions. You are assuming spiritual purity as a necessary fact, and separating consciousness entirely from the brain and body without evidence this is the way it happens. I don't agree with the premise. You are trying to use entheogens to test a false assumption about the relation between samadhi and physical states. The correct process is to make the journey in person and see what you come up with after a good lot of experience. Symbiotic Existential Cosmology asserts all such moksha states are organismic consciousness asymptotically approaching a non-encapsulated brain state that complements a cosmic mind experience. They won't be NPB-null like you are suggesting.

Fig 277: *Psilocybe aucklandiae* was officially described in 1991 by Gastón Guzmán, Chris King and Víctor Bandala in 'A new species of *Psilocybe* of section *Zapotecorum* from New Zealand.' The name is feminine; the original orthography is *aucklandii* which has a masculine suffix (my picture, now in Stamets (1996 p90).

Ram: Okay. It seems it is illegal in New Zealand (is this your country?), then how did you take it?

Chris: Exotic mycoculture, but I discovered *Psilocybe aucklandii* as a mycologist.

Cathy Reason: For health reasons, I am unable to use entheogenic substances, so I am wondering if it is possible for someone to say something about the phenomenon of "ego loss". Is it the experience of dissolving into one's perceptions of nature? I have certainly experienced that, in the presence of the natural environment. But there has never been anything particularly scary about it. Or does it involve some intrinsic loss of individuality or agency? Both of which I would find rather horrifying.

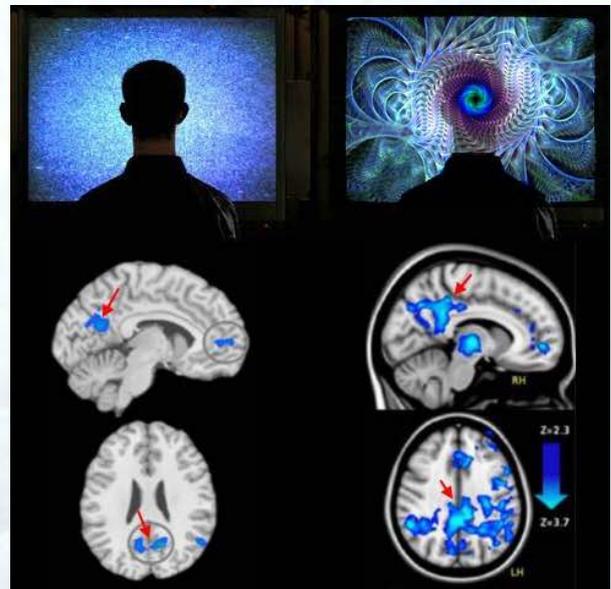

Chris: The cortex is organised to be a complete envelope of experiential aspects, so our everyday experience is that of being a conscious volitional agent trapped in a set of perceptual sensory experiences we come to recognise as the form of a physical universe and other sensations to do with the body and our emotions. This form of consciousness is implicitly streamlined into a "self and other" modality to survive biologically.

It involves emotions that are sometimes quiescent while we are cogitating but at other times soar into states between exhilaration and despair, fear, anger, hope, contempt repugnance and disgust, love and hate. There is a major resonating network called the default mode that occupies our mind with the odd thoughts of a person when we are in between focused tasks that causes us to worry about future events and rehearse impending crises like applying for a job, or going to the doctor. This circuit is also linked to limbic system emotions, so under threat or under desire it displays features we associate with egotism i.e. urgent need for organismic survival, power, control and fame.

Forms of meditation including mindfulness, annihilation (letting-go of self) and inner silence inhibit the internal dialogue and reduce the ego perspective. Psychedelics do this more powerfully, in a multi-sensory sensory flood of all aspects of existence accompanied by a reduction or loss in the division between self and other, particularly in sensory withdrawal, leading to mystical type experiences of natural oneness awe, or atonement and sometimes a kind of doom if one gets paranoid, or overdoes it. This experience tends to be formative because it provides a complete vision of escape from the binds of ego and a new understanding of life and natural and spiritual existence not trammelled by the underlying mortal coil. If you overdo the dose you can end up feeling you have literally died, which is a bit disconcerting, but it does give respite and succour to people who really are in a terminal condition, so it's only scary to the insecure ego. That's why it is important to have a caring support environment or to go into the wilderness or another safe quiet place.

Fig 278: Pure meditation, such as transcendental meditation on its own, is like watching a blank TV screen and falling into the lowest energy state of samadhi as "divine bliss". Psychedelic meditation complements this with "ultimate reality" leading to moksha. Blue shows reduction in default mode system accompanying ego loss, which in psychedelics, is also associated with a sensory flood, due to increased interconnectivity between regions.

Ram: It is unclear why CK's drug-meditation-based conclusions are just the opposite of yoga-meditation-based (even shamanism-based ones who ingest such drugs but still believe in the spirit world) conclusions. Is it simply CK's view, i.e., he might have the same conclusions even if he has not

ingested such drugs? I am wondering what Maria Sabina's (who ate mushrooms like food) view is.

Chris: The lesson of nature is that everything is confoundingly different from our naive, e.g. religious, assumptions and preconceived notions. The lesson of psychedelics is that everything conscious is profoundly different too. I want to learn with no heavy colours on my brushes from traditional spirituality to paint transparently so that people can see right through me. Language is a mysterious teacher. There is a verb to lie but there is no English word for a truth speaker. So I am forced to say what I am doing is "truth speak".

I accept conscious spirit phenomena. I've said I see all life in an integrated state of eternal telepathic communication when on mushrooms, but that's just a one-person veridical report, not spiritual "evidence" unless its affirmed by others. I communicate with the winds and chaos reigns, whirling my very identity into the atmosphere. We all need to let go of our rational mind in this way to fully communicate with nature.

I accept the Spirit world of the Huichols and the nierika portal as a cosmic observation. Neither do I differ from Maria Sabina, who both sang to Chicon Nindo the Mazatec lord of the mountains and all the spirits of the Catholic saints and said she was both Yeshua and Maria. Here is one account below. The point is that this is metaphorical spirituality of the vision quest not a literal piece of doctrinal religion about astral planes or the 28 requirements for enlightenment or the seven levels of heaven:

'The father of my-grandfather Pedro Feliciano, my grandfather Juan Feliciano, my father Santo Feliciano - were all shamans - they ate the teonanacatl, and had great visions of the world where everything is known... the mushroom was in my family as a parent, protector, a friend'.

Maria Sabina took sacred mushrooms in abundance as a child. A few days after watching a wise man cure her uncle:

'Maria Anna and I were taking care of our chickens in the woods so that they wouldn't become the victims of hawks or foxes. We were seated under a tree when suddenly I saw near me within reach of my hand several mushrooms. If I eat you, you and you" I said "I know that you will make me sing beautifully". I remembered my grandparents spoke of these mushrooms with great respect. After eating the mushrooms we felt dizzy as if we were drunk and I began to cry, but this dissiness passed and we became content. Later we felt good. It was a new hope in our life. In the days that followed, when we felt hungry we ate the mushrooms. And not only did we feel our stomachs full, but content in spirit as well. I felt that they spoke to me. After eating them I heard voices. Voices that came from another world. It was like the voice of a father who gives advice. Tears rolled down our cheeks abundantly as if we were crying for the poverty in which we lived.' She had a vision of her dead father coming to her. 'I felt as if everything that surrounded me was god. Maria Anna and I continued to eat the mushrooms. We ate lots many times, I don't remember how many. Sometimes grandfather and at other times my mother came to the woods and would gather us up from the ground on which we were sprawled or kneeling. "What have you done?" they asked. They picked us up bodily and carried us home. In their arms we continued laughing singing or crying. They never scolded us nor hit us for eating mushrooms. Because they knew it isn't good to scold a person who has eaten the little things, because it causes contrary emotions and it is possible that one might feel one was going crazy' (Estrada 39).

After the death of her first husband Maria Sabina performed a velada for Maria Anna, who was sick with an internal bleeding. After expressing the blood she had a vision of six or eight people who inspired her with respect - 'the Principal Ones of whom my ancestors spoke'. One of the Principal ones spoke to her and showed her the book of wisdom. She realised that she was reading her book. Afterwards she had the contents always in her memory, and became herself one of the Principal Ones who became her dear friends. After this vision, she had another vision of Chicon Nindo the lord of the mountains, a being surrounded by a halo, whose face was like a shadow. She realised that she had become his neighbour. She entered the house and had another vision of a vegetal [spirit] being covered with leaves and stalks that fell from the sky with a great roar like a lightning bolt. "I realized that I was crying and that my tears were crystals that tinkled when they fell on the ground. I went on crying but I whistled and clapped, sounded and danced. I danced because I knew I was the great Clown woman and the Lord clown woman" (Estrada 49).

What I think is wrong is spiritual materialism – invoking a parallel world in which astral events or spirit events occur. Or treating the spirit world in a similar way to the way we treat the physical world where souls replace organic personas. When I go down into the abyss it's with no assumptions. I try very hard to avoid "spirit talk" because it's full of quasi-religious connotations and leads to ideas like the gnostic pleroma. We need to have our head in the clouds and feet on the ground like the axis mundi and the world tree.

Ram Dass and George Harrison were at the naive phase of psychedelics when no one could comprehend what their role might be and any Vedic solution solved their hunger in instantaneous exotic faith. Essentially they didn't know how to hold their potions. Ram Dass went to Neem Karoli Baba and did what any naive Western person is liable to do. When I asked the Chai Baba on the ghats in Varanasi, he had a much more equivocal opinion of Neem Karoli Baba.

Since our experiential cosmos is divided into perceptions, dreams and visions we need to explore these really fully in the age of natural science, and in particular entheogenic visions because these are the richest waking non-ordinary experiences we have access to.

The richness I attribute to psychedelics is their overflowing experiential fullness, not compared with human cultural experiences but as agents, allies and advisors. The key is non-ordinary experiences in the sense of lying outside the physical/perceptual world view. We have a very good conceptual understanding of the perceptual/physical through science. But we have almost no idea of non-ordinary experiential reality, in which I will include samadhi/satori, dreaming reality, and entheogenic states induced by psychoactive species. Samadhi/satori utilise a high degree of mental control to achieve ego loss accompanied by claims of siddhis. Dreaming reality is only partly autonomous and requires difficult exercises to achieve and maintain dreaming lucidity. By contrast, psychedelics are experientially overflowing with richness to the point of sensory overload.

The entire vista of our psychic existence hinges on the inner nature of non-ordinary subjective experience. This is the lightning rod through which all the mysteries of existence flow, all the heavens, all the hells, all the emptiness and cosmic consciousness, all our hopes and fears of the after life and all our transfigurations and revelations. But we are all standing like little children at the portal, too scared to find out what's there in the experiential abyss. Everything we know about nature and the universe has been absolutely confounding to our naive religious notions. The subjective abyss is completely uncharted, apart from scattered claims of some mystics, prophets and a few yogis in the Himalayas making unverifiable claims about astral spaces. Psychedelics are not psychic tourism. They are cosmological science putting the full Cosmos into the physical universe. We have no idea if the well is deep or just a bunch of hallucinations. If it is deep it could be very deep indeed and it could be more wildly different from our expectations than our most fanciful or trusted spiritual notions. The key to life, the universe and everything is contained therein.

Chris: Here is an account of Karen Armstrong (2022) in "Sacred Nature"

The rishis attributed their poetic power to the hallucinogenic plant soma, which enabled them to look beneath the surface of things and discover a deva in every single one, so nature was alive, imbued with the divine. They called the faculty they had cultivated dhi ("insight"); it gave them a knowledge (veda) that bore no relation to mundane awareness. All these divine forces, the rishis concluded, were grounded in a mysterious omnipresent power, which they called Rta, one of the most important concepts in the Vedas, the ancient texts of Hinduism. Rta is best understood as "active, creative truth" or "the way things truly are."

By about the sixth century BCE, however, the Aryans were redefining the ultimate reality; and they called it the Brahman. While Rta had been the eternal principle of being that informed and permeated the universe, the Brahman was the foundation of all reality, the "beingness" on which all things depended.

John: Soma was likely a mild drug compared to the refined psychedelics of today and used to aid the process, or in many cases not needed at all as with many modern mystics. So I would say useful for some but not necessary for any. It is important to know that the power of divine insight is within us, not derived from anything external.

Chris: The biosphere is not "external" to us if we want to survive as a species. I am certain the natural sacraments are biospheric foresight. The central neurotransmitters like glutamate and GABA are cosmically abundant amino acids and serotonin has a close to primal origin. The brain, for all its complexity, has used primal amine neurotransmitters because of their archetypal properties. Given the climax diversity of the biosphere, it is almost inevitable that modified forms of serotonin such as dimethyltryptamine and psilocin will arise. The natural psychedelics are thus cosmological molecules that are also fundamental to the conscious future of *Homo sapiens* in the biosphere. It's that literal – the scientific, cosmological and religious truth. So to say *Homo sapiens* should treat the biospheric sacraments as "external" and therefore "not necessary" is a betrayal of both the Cosmos itself and of nature, in favour of anthropocentric control of our conscious dialogue with nature and reality. I could fairly comment this is a cardinal sin against the immortal survival of life, given the apocalyptic world context and I think I would be right.

John: The Rishis certainly used something unknown called Soma and greatly revered it as a healing as well as mind enhancing potion made from some leaves. However I think it would be a serious error to think that their insight was attributed to soma as opposed to that being a minor aid. Much greater attribution is given to yoga and I'm quite sure that is the correct order of things. The power of insight is something we have already and accessible by Will or intention alone.

Chris: Aldous Huxley, p 659 cites the opinion that the yogic tradition (possibly derived from the Shiva-Kali planter cultures of Mohendro Jaro) was a compensation for the loss of access to soma as the Aryan invaders descended into India where it couldn't be found. Isn't it a more serious error whether knowingly, or unwittingly, to contradict both the evidence of history and the example of Indra, king of the devas and heaven in this matter?

Drinking soma produces immortality (Amrita, Rigveda 8.48.3). Indra and Agni are portrayed as consuming soma in copious quantities. In the Vedic ideology, Indra drank large amounts of soma while fighting the serpent demon Vritra.

"Minor aid" is clearly not what Indra thought and he is the ultimate authority on this question. It's not good karma to try to bend history to our own anxieties. The mushroom is NOT a minor aid. It is a paradigm shifting essential medicine evolved by the biosphere for the beneficence of the Human species.

John: Rta is never defined in the Vedas. It has been called "Cosmic order". It is a pointer to the ultimate unknowable but with the knowledge that is is the source of order which allows all views of it. Brahman is described this way also and I would consider it indescribable also but more penultimate than Rta, which is ultimate.

Chris: I think this is an inspired view because you are naming the mythopoetic source of the mystical entity as supreme over ultimate reality! But I'm really worried about identifying either of them as agents of order. Karen said: 'Rta is best understood as "active, creative truth" or "the way things truly are".' Where is the edge of chaos in your description? I know its all patriarchal religion – But Indra is associated with the sky, lightning, weather, thunder, storms, rains, river flows, and war. It looks to me that the odd tornado and hurricane is passing right through the Rig Veda! So it's also the rule of chaos isn't it?

John Jay Kineman: I don't question the value of the psychedelic experience as you describe it, but with my experiences in India over the past 20 years I do question the statement that there is nothing else as profound. Remember Neem Karole Baba downed a half bottle of Ram Dass' LSD and was unaffected. He said he's there all the time and in total control. I've seen enough amazing things and people here to believe Ram Dass' account and NK Baba's claim.

Chris: I think it was a neurotic mistake of Ram Das to be so naive with Karioli, who had only 1000 mics and knows how to sit still, and it was part of the cliché of writing "Be Here Now". I've told you the Chai Baba of Kedar Ghat had a low opinion of Karioli, so don't put him on a pedestal. Total control is not samadhi. It's is the opposite of moksha and it's not enlightenment. Psychedelics, particularly the three natural biospheric sacraments peyote, ayahuasca and sacred mushrooms are one of the oldest spiritual-shamanic traditions in existence. Patanjali acknowledged the herbs and soma is the founding of the Indo-aryan tradition of the Vedas. Mushroom spores and species are endemic planet-wide. They are here for a reason. They are not a distraction and they are not illusion. They have been turned from recreational ventures into class 1 toxins then somersaulted into cures for people with psychiatric problems – clinical depression, PTSD and terminal anxiety in cancer, but they are here to enlighten us. Samadhi is a natural complement, not an alternative. The Vedas are insufficient on their own. Sorry but that's the breaks.

John: It's certainly possible in that case, but there are many cases and I don't dismiss them so easily. By total control, I meant over staying in that state, which of course is a state of lack of control over reality. But what experienced meditators and mystics can do is hold onto a kind of suspended worldly reality. I have achieved this but only in brief periods. A sound, a thought, a belly ache will easily pull me out of it. Mostly it is a thought that pulls me out. And you are quite correct about control, it is not really control - that was my word not anything I think Ram Dass or his guru said. In fact when I enter into this transcendental state it is nice and attractive and I start congratulating myself but also wanting to stay there, wanting to control that, which is exactly what takes me back to the world. But there is something else, as you say, the giving up of control that preserves the experience. Sadguru claims that when he was younger he once tripped out this way for 13 days. When he came out of it villagers had decorated him with garlands and flowers. He thought he was out for perhaps hours. It's somewhat believable in his case, because he also describes his experiences in school and as a young boy where he would get absolutely fascinated by a single object, having the sense of wonder and thinking that he really doesn't know what that thing is and is fascinated by it, unable to take his attention off it. He tells a joke about being in class and the teacher sees him spacing out and says "pay attention". So he did, but not to what she was saying, to her as a being, a phenomenon. He says he gave her attention like she has never had before. But I think he still flunked the class.

Chris: I'm not discounting the experiences of the Upanishadic Rishis and the powers of the siddhis. In fact I am a rishi embracing them fully. But I don't think we should measure things by how far "out of it" yogi's get. It's the novel insights they do or don't express to us that are revealing. I'm saying psychedelic moksha is the natural complement of the path of samadhi. This is an urgent mission for me to save life not to popularise psychedelics.

You have a notion of spiritual purity that sees the individual under their own pure consciousness that is just a pure expression of their spiritual strength and focus to achieve a realisation of what you think is cosmic consciousness. It is also spiritual elitism in pure human consciousness transcendent over nature, in an ideal accompanied by renunciation of worldly distractions, thus rejecting life itself. It also preaches a form of elitism that only the severely devoted rishis who are also singular mystics, as exceptional gifted individuals we can't question or emulate, have even a clue or otherwise everything we experience is just illusion. In my experience this as an anthropomorphic cul-de-sac. Both pure spirituality and controlled samadhi lie under this shadow. This produces habits of spiritual renunciation that are disconnected from life in the pursuit of illumination.

There is another much more completely natural and organic way of achieving a deeper more biospheric rather than human alone form of cosmic consciousness that looks and feels entirely different. The highest states of enlightenment are not found through the spiritual supremacy of one conscious species that is already trashing the planet this way, but through the symbiotic biospheric consciousness of enlightened life as a whole. This looks like a complex system perturbation of egotistical organismic consciousness because it IS, taking us out of our illusory selves. Out of our finite limitations. The psychic species play a key part of this psycho-symbiotic role. This is the true Mahayana of life, not in a restrictive purist one way Jesus dogma, but in the Tao of the living totality that sustains life in the passage of the generations. That's the true dharma! The rest is bs.

John: I don't know what is moksha. When I get there, and if I want to come back, I'll say something.

Chris: We both know moksha is escape from the round of birth and death. You know Vedanta and you know what it means. The entire edifice, from the Jains through the rishis to the Buddhists have embraced a notion of reincarnation and enlightenment being the great escape. This is really the escape from the mortal coil, so it is often likened to maha-samadhi, or death. But what it is, is a near death meeting of atman and Brahman in which we can see simultaneously as one is to one both from our incarnate mortality, and in symbiosis with the spiritual eternity of ultimate reality in cosmic consciousness. That's the exact key to the existential dilemma. Then we can get on and live our precious lives caring for life itself in all its overflowing glory. And we can do this again any time if we keep good faith with not abusing the experience.

Psychedelics are many things but the key thing is their ability to precipitate a near death experience in the midst of life when combined with samadhi. This doesn't have to be sustained, or to take all day, or four hours a day. As long as you practice mindfulness and then complete abandonment in sensory withdrawal when the effects ensue, you can enter the nierika of ultimate reality. If you don't do samadhi meditation you will just have a mushroom or ayahuasca trip which is good too although it can be dysphoric.

John: I don't know how to ask a mushroom its reasons for being here, or if it would know. Our reasons may not be important in the larger scheme of things. We find them very helpful on many levels. That's all I know.

Chris: I'm not suggesting to ask them, although some people do. To me it's evolutionary karma. From the earliest eucaryote we have been evolving as sappy conscious organisms. So the mammalian brain inherits an ancient psycho-chemical propensity for enlightenment when ego-consciousness becomes cosmic consciousness. You can see it in the neurotransmitters of the ascending reticular activating system which contains an absolute pharmacologists kit bag with all of dopamine, nor-adrenaline, serotonin, histamine, acetyl-choline, orexin and glutamate, becoming the symphony on which subjective consciousness is played out in the phases of wakefulness and light and dreaming sleep ecstasy and despair. Evolution has found ways of producing psychedelics which have become selected for by conscious animals e.g. in mushrooms, spreading their spores and in the case of humanity this can radically alter humanity's relationship with nature and biodiversity and save the planet from a mass extinction of life, not because it is a cliché of salvation, but because it is the crowning glory of biospheric enlightenment.

John: I am not opposed to medicinals for facilitating an out of the world experience, and certainly native people have been doing this for a long time. Did they achieve enlightenment from it? What degree? I don't know how to compare

that to someone like Ramana Maharshi, who's mountain, cave, and ashram I visited. The stories can't all be dismissed as cultural creations uninformed by medicinals.

Chris: Well I'm trying to explain the difference. You see a medicinal as a prop like a prescription medicine that clouds or diminishes enlightenment. I am suggesting it is the full dimensions of cosmic consciousness because it arises from a complex system ecologically.

John: But why the need to elevate the medicinal plant above self-induced mental practice? That makes no sense to me since there is obviously so much that can be experienced both ways.

Chris: The need to elevate is to ensure the survival of the diversity of life as well as the ability to illuminate. Psychedelics are very complex agents and challenging, and even a mild dose can make me nervous, but the results are really positive across a wide spectrum of studies. They are unique to the individual but they are gaining a track record which looks like the resolution of the existential crisis. Religions preach eternal life as an illusory remedy to mortality. Vedanta does the same with unattainable cosmic consciousness and reincarnation that never gets there. Why would you want to have faith in that? I owe faith only to life, the universe and everything, not spiritual beliefs. A visionary doesn't need to gamble their garments with their adversaries.

John: Since you have been telling us of the virtues of psychedelics I have been intrigued and, as we know, skeptical of that as a primary avenue. My comments along the way have been to the effect that this is an artificial means to achieve what spiritual practice seeks to do "naturally". You have pointed out that psychedelics come from nature and are used by native peoples, so in a sense "natural". I am personally intrigued and expect that at some point, under the right circumstances, I will try it. I have close friends who do and for the most part they come out no stranger than when they went in, but probably more equanimous about life. Of course I observe the same with graduates of A Course in Miracles, and other schools. I don't know how long after the first 'trip' one starts to gain a calm understanding of it - perhaps you can say.

Chris: Psychedelics are challenging experientially so it can take persistence, like any other shamanic or meditative practice, but it doesn't take lifetimes as pure meditation does unless you are a natural mystic on the edge of sanity. Generally in a good guided session, a person realises the very first time that they have entered non-ordinary reality that turns their preconceived notions of reality inside out. But then as Cathy asks what do we do with Heaven and Hell spectres that can and do occur and the ability of very egotistical people to see themselves as messiahs. The answer is the one Roland Griffiths gave in the previous e-mail I sent. Basically a good supportive session can lead to a so-called quantum change experience which changes the person's world view sufficiently to enable them to see things anew, or as they actually are, particularly about the mortal condition.

Being an exceptional mystic is also an unreliable asset as Huxley noted with William Blake, who lost his visionary psyche in mid-life only to regain it in old age. My first acid trip of 500 mics was wonderful, so I went back to London in 1968 and took 1000 mics – Karoli's alleged dose. I was completely convinced I had died. I could walk around normally although everything was suffused with shimmering light but it took ages to come down and left me with phosphenes. At the same time a false news announcement from the FDA said LSD split your chromosomes so I panicked and didn't take any more for five years. Then my best friend, who also had an affair with my wife causing great anxiety, offered me another and I was so nervous I banged my head into the living room window and smashed it, so I decided to take the plunge. This began a trail of hundreds of LSD trips which were wonderful but I couldn't get right through to nirvana because I was staying too alert and looking at the trip in too much of a direct sensory physical way so it would start to go into the portal and I would notice and flick out like when you are trying too hard to get to sleep and can't. It was still overwhelmingly fascinating and made all other notions like religion stereotyped cul-de-sacs.

Then I took a lovely little mushroom trip in Taos NM while baby sitting for a family prominent in the peyote church meeting there and later did a peyote meeting myself there. From there I made it to the El Catorce Real high peyote fields of Mexico and took peyote on Wirikuta, mushrooms at Palenque, and ayahuasca on Yarinacocha lagoon Pucallpa Peru. This began a life where I was in symbiotic relationship with all three sacraments. The trick is not to stare into the patterns too intently but to alternate between one-pointed mindfulness and closed-eyed annihilation of one's self, just letting go as close to mara-samadhi as possible. My mushroom trips always revive the spiritual dimension, but only sometimes do I descend into full union and know I've been there. So it can both be an immediate clear light insight with the first experience that is world-view changing and also a lifetime process. I sometimes held small veladas on our

land with a group of close friends but it's not something you can advertise and stay out of trouble. It's only with the new scientific therapeutic revolution that I have "come out". That's why we are all trying to catch up now because of prejudicial social repression.

John: One thing is to see new realities, but another is to clearly examine and understand the limitations placed on ourselves by old ones, including our own histories and beliefs. It is one thing to experience strange new worlds (not a plug for Star Trek), but another to be physically a part of them, not just mentally. While you are having this experience home alone, another may be having to adjust to life-changing surroundings and interactions with complete cultural and physical immersion. Maybe you can comment on how well psychedelics contribute to actual agility.

Chris: It's all about existential agility and I'm trying to take the entire living universe with me, not just consciousness, so it's doing exactly what you describe. My life is like sailing down Hardanger Fjord and there are times I really need to tack or even jibe in buffeting breezes, or near the rocks, so I generally wait months or years until the auspicious or anti-auspicious crisis and then force myself to stop being nervous, which happens because its been ages. When I do after the effects ensure this nervousness turns into knowing as also we are known and I am back to my full shamanic being. The one thing to avoid is waiting until we are on our death bed to take the plunge. When I discovered SEC, it was after a seven year break because of acute closed angle glaucoma and it was a very mild trip but resulted in a lifetime peak experience.

John: My hypothesis would be that in both cases, psychedelics and meditation, realization of actual benefits needs to involve integration with and direct learning from physical existence as well - that it's the balance that advances us.

Chris: Absolutely!

John: Another thought you might comment on is that the aim of both practices seems to be lessening one's dependence on those physical circumstances that challenge us in life and, as above, strange circumstances. Moksha and enlightenment are presented as involving very profound detachment from the physical world.

Chris: Detachment from mechanistic logic and deductive thought but not the living universe. I don't believe that renunciation of the living universe is productive. The Brihadaranyaka is the Upanishad of the great forest, so its union with nature not just consciousness. Notice that Huxley's editor began the snippet of Island and the moksha medicine with sex. We exist only through sexuality. If we reject sex as many Eastern traditions do in favour of the illusion of pure enlightenment, we are rejecting the physical embodiment of life itself. That can never further. If you think that is a quick trip to realisation, think again. The real liberation comes from symbiotic relationship with nature. It's cosmological consciousness to be fully immersed in nature because we ARE incarnate. No matter what pretences spirituality brings to the table, without sex we are sterile and without symbiosis we are statues made of matchsticks in a technological dystopia.

John: Now there is a paradox there in that one is presumably still having a body, without which we have not data.

Chris: It's not data our body gives but the immortal passage of the generations of life forever amen.

John: So, there is an obvious attachment possibility there, but it is clear that many worldly things fall away on the journey to the supposed ultimate.

Chris: What supposed ultimate? Why? To redeem reality means redeeming the entire cosmos and humanity in the biosphere, not just personal enlightenment. Ultimate reality is facing and accepting and transfiguring existence here and now. We HAVE to redeem life. Jacob's ladder and the stairway to heaven are eternally sterile.

John: Thus it seems paradoxical to propose that a chemical is the best means for achieving such detachment, since it is a physical means, regardless of the question of dependence long-term.

Chris: Not chemicals, .living sacraments. I gave up LSD because it was a chemical and after the days of window panes and the original orange sunshine you couldn't trust the sources. But it's not about the chemical. You are already mechanising it. It's about the living sacrament and what it is here and can do. As I have said the actual nature of what entheogens do is not well understood. If you take MDMA or ecstasy, as I have once for a test, it is a whacking serotonergic dose, and it's lovey dovey touchy feely but not a psychedelic. It's very pro-social and you can go to a rave without trouble. You get phenomenally high but it's entactogenic, not psychedelic.

There are two mysteries. The first is that psychedelics are super-agonists that open a unique metabotropic pathway in 5HT2a neurons that serotonin itself doesn't and that sets off slow waves of glutamate brain excitation. Why s the brain providing this route? We don't yet know, but it may be a form of autonomous psychedelia in some people. The second in the case of mushrooms is that the psilocin genes evolved from a transposable element not from the mushrooms themselves, so the origin of magic mushrooms is mysterious in itself.

My hypothesis is that consciousness has evolved from single celled eucaryotes using the entire spectrum of neurotransmitters they invented, which we see in the multiple neurotransmitters of the ascending reticular activating system, so the brain although electrodynamic has at its foundation the sappy social signalling molecules the drive organismic survival like dopamine, serotonin and nor-adrenaline and that this is the foundation of a second wave of biospheric evolution that produces phytochemicals that have evolved to affect animal behaviour, so we get all the medicinal species from opium to cocaine and we get entheogens too and these are the evolutionary foundation of the great symphony of conscious existence in the surviving biosphere, provided dominant species such as ourselves learn to understand their evolutionary role.

John: The claim is that it is necessary, not just instrumental, for the enlightened experience, and yet to have any physical necessity is contrary to what we imagine to be the aim. In general, the method to an end should have or practice similar characteristics to that end.

Chris: To what aim? To what end exactly? That's casting lots on our garments of redemption before our time has fully come. The only way for us as incarnate mortal biological sentient beings to have a real future is to live symbiotically with life as a whole using our climax intelligence not to become utopian technology alone but living enlightenment in conscious nature. That's what we need to do now and very quickly, which is the ONLY reason I am here saying this because it's more urgent than anything else. We HAVE to save the diversity of life and regain paradise on the cosmic equator in space-time or we will go down like one of the princes: *I said, "You are gods, And all of you are children of the Most High. But you shall die like men, And fall like one of the princes. (Psalm 82:7)"*

John: I agree wholeheartedly with your comments about integration with life. By detachment I also mean reducing psychological distraction and dependence while increasing involvement as a more relevant being. Sexuality has a purpose, as we know, and in some schools that is seen as passing through phases of life. Like many drivers it requires mastery of one's psychological addiction and this can be extremely beneficial in all phases. There are situations in any culture where sex can become inappropriate, and one's ability to accept that is important both for a peaceful and fulfilling life and for spiritual progress. It is a powerful driver, I think, for most people, but that energy can be transformed and channeled in different ways as the demands and phases of life change.

You said "To what aim? To what end exactly? That's casting lots on our garments of redemption before our time has fully come". We both use the words enlightenment and moksha to suggest some kind of greater self awareness but perhaps mainly as an end to suffering and anxiety as in Buddha's quest. The word "equanimity" is also used. The main question I come away with from your description is the role of volatility. Life can be a rollercoaster ride but for many the spiritual quest is an attempt to tame one's reaction to events, which actually allows greater agility in responding to those events as a constructive agent. One becomes the force that can calm emotional seas and navigate a steady course. But perhaps with that it is equanimity and steadiness of purpose and confidence in self. Knowing without doubt who we are that is invulnerable. Still, I say "some schools" of thought because I can imagine an argument for acceptance of volatility too. The bottom line might be if it is what we truly want. Being anxious is not pleasant and may not be necessary, so eliminating it seems like a valuable goal if that doesn't result in missing important warnings in life. So the goal would be associated with increased not decreased awareness.

Chris: The whole question is about the assumed link between cosmic order and the universal good which is where God comes in with the mixed blessings of heaven and hell, like a psychedelic misadventure. I use the lessons of life to

deduce meaning, so I see mortality as real life in the centre of the cyclone at the edge-of-chaos, with the regime of order stuck in a rut of totalistic oppression and chaos causing rampant “thermodynamic” dissolution, so both are unviable extremes and we survive by juggling the broom upside down in the palm of our hand. So for example carnivores are necessary and mortal life can be absolutely terrifying torture and unbearable agony. But between the extremes life springs forth resplendent. To venture into the unknown and understand the cosmological foundations of consciousness we have to make a journey into the crack between the worlds. So we can’t call the shots in advance. To me in the last cosmic analysis, conscious life is invincible and could regenerate, even if life on Earth ceased to exist, but it’s an assumption we can’t afford unless and until we know there is viable compassionate life elsewhere.

Robert Boyer (2022): The three psycho-physiologically defined states of consciousness in ‘Western thought’ are waking, dreaming, and sleeping. The ordinary waking state is associated with sensory perception, thinking, and intellectual reasoning commonly experienced in our daily lives. This state is characterized by the distinction of ‘experiencer’, ‘process of experiencing’, and ‘object of experience.’ ... This moment, looking outside to read this paper, you receive input through your senses. You experience the input in your thinking mind, processing it for meaning and relevance. You may also analyze it on the deeper level of the intellect to understand it better. You may further sense deeper feelings about its relevance. And, you can sense that your self is the experiencer of these sensations, thoughts, and feelings. Further, you can know directly that, behind all this, you are conscious. These are the natural levels of inner subjective mind in the Vedic model of levels of mind. Going deeper inside are the senses, the thinking mind, the intellect (which includes discriminative and deeper unifying functions associated with feelings), the inner ‘I’/self/ego, and consciousness – which you are ‘experiencing’ right now by being conscious

Vedanta and the 7th natural state of consciousness: Unity consciousness. Maharishi (1967) describes unity consciousness as the supreme level of human development in which every phenomenally separate object of experience including one’s individual self is spontaneously known, experienced, and attributed to be nothing other than the infinite value of one’s own universal Self. In unity consciousness, there are no gaps in the infinite eternal oneness of Being.

No diversity of life is able to detract from this state of supreme Unity. One who has reached It is the supporter of all and everything, for he is life eternal. He bridges the gulf between the relative and the Absolute. The eternal Absolute is in him at the level of the perishable phenomenal world. He lives to give meaning to the paean of the Upanishads: “purnamadah purnamidam”—That Absolute is full, this relative is full (pp. 448-449).

In the 7th state of consciousness, unity consciousness, wholeness, oneness of everything is the primary locus of experience, permeating all phenomenal diversity and change. This highest state of consciousness is the emphasis of the Darshana of Vedanta (the ‘end of the Veda’), spontaneously living the ultimate oneness of everything. Maharishi (1967) explains that on the basis of the profound intimacy between the knower and the known in refined cosmic consciousness, complete unification of subjective and ‘objective’ existence simply unfolds naturally as a matter of time.

Chris: I do like the relaxed approach of TM, in that it is aiming at a natural process to make meditation go with the flow in a fulfilling way that in your view is capable of respecting nature and brings peace and happiness. Your descriptions of the seven levels of samadhi all have a single common basis in more refined versions of perfect unity of subjective and objective consciousness and the thrust of the discussion in your text is about distinguishing the objective reality process of physical perception from the subjective experiential process of inner consciousness rather than deep subjective experience itself.

Let me underline what I see as the central problem in **"Ignorance and Enlightenment: What's the Difference?"** (Boyer 2022). Your account is aimed at a polarity between everyday consciousness, which is attributive of the physical universe and the sublime conscious “Self”:

To clarify the idea of ‘object-referral’, the ‘object’ is experienced as a separate outer object, frequently in the outer physical environment and held to be independent from the inner ‘subject’ or ‘I’.

But we simply can't fully understand nature without exploring the physical foundations of how life arises. So you are denying natural science by imputation throughout, because it distinguishes subjective and objective. This is NOT a valid basis or sufficient cause to affirm TM.

The natural experience in ordinary waking is characterized by a gap between the outer objective and inner subjective world – the mind-body problem. This gap needs to be bridged for the unity that science rigorously pursues, and toward which it is inexorably progressing.

This is not an adequate starting point to justify enlightenment in an of itself and becomes a doctrinal exercise in the way you quote Maharishi Mahesh Yougi (MMY) as the final word. MMY's idea of "nature is physically and naturally deficient. Nature to MMY is just the levels of consciousness, typified in the seven levels of enlightenment. It shows no respect for genes, cells, the fecund cytosol, or any physical or natural aspects of conscious life, just the need to bridge subject and object in one transcendent "Self". It is committing the foundation error of Vedanta in identifying nature as subjective consciousness, after which it induces a tower of higher "spiritual states" and ignores the significance of natural differences e.g. between living species:

The six Darshana (what is 'seen') are different perspectives of the totality of nature. They are here depicted in a sequence and on a continuum from virtually no wakefulness to full wakefulness of the totality of nature.

Yes your description of the "tower of spiritual states" of enlightenment goes to the seventh but they are simply an intellectual construction deriving from the seven layers of heaven and the seven layers of Hell. They are NOT enlightenment and should not be described as achieving it, or it is a misrepresentation. Remember the dance of the seven veils is Inanna stripping herself naked before the Galla in her descent to her sister Ereshkigal before returning and sacrificing Dumuzi, just as Shiva is the God of Death pictured with his trident in Mohenjo Daro. It's nothing new and goes back to the Sumerians and also pervades Jesus, anointed by Magdalen, out of whom went seven devils, to his doom, crucified before the daughters of Jerusalem, harrowing hell and rising on the third day from the dead.

To get this picture clear, let's just see what Etymonline considers nature to be. It's NOT just consciousness, or the seven layers of conscious "heaven", it's very much the world of tooth and claw. Nature IS **natal** of birth itself!!!

nature (n.) late 13c., "restorative powers of the body, bodily processes; powers of growth;" from Old French *nature* "nature, being, principle of life; character, essence," from Latin *natura* "course of things; natural character, constitution, quality; the universe," literally "birth," from *natus* "born," past participle of *nasci* "to be born," from PIE root *gene- "give birth, beget." By mid-14c. as "the forces or processes of the material world; that which produces living things and maintains order." From late 14c. as "creation, the universe;" also "heredity, birth, hereditary circumstance; essential qualities, inherent constitution, innate disposition" (as in *human nature*); also "nature personified, Mother Nature." *Nature* and nurture have been paired and contrasted since Shakespeare's "Tempest." Specifically as "the material world beyond human civilization or society; an original, wild, undomesticated condition" from 1660s, especially in *state of nature* "the condition of man before organized society."

Robert: I think the term moksha frequently refers to the natural permanent establishment of samadhi,

Chris: I accept that there can be diverse forms of samadhi also reflected in the processes and practices that lead to such states. This probably also applies to approaches to moksha. However there is a lesson here I think we need to appreciate from the discovery of nature. What we now know of the natural universe is counter-intuitively confounding to our naive religious notions of the natural world. Theories of everything are just as confounding.

What I learn from non ordinary reality is that both dreaming and psychedelic experience lead to wildly different and diverse states of conscious experience which transcend ordinary physical world perception and constitute a largely unexplored deeply confounding abyss, akin to the notion of *tohu va vohu*, before God's works of old.

For this reason I think we need to understand moksha in the way the Huichol understand the peyote quest to enter the *nierika*, as a vision quest to discover the inner nature of reality in the "spirit world". This means it is not just a state of permanent samadhi as perfect consciousness, but contains the entire cosmic mystery we have yet to discover the full dimensions of on a visionary journey of discovery. It entails a trip or journey into the unknown that we voyage as "psychopomps" on a lifetime journey across the Styx, which is a little like Dante's divine comedy, in its sheer ornateness and mind boggling diversity of experience.

This means I don't think moksha is a one way trip, but it is a journey where the test is what we bring back to the known world as discoveries to enlighten others about the outer boundaries of existence. For example when I met Brahman, I could experience simultaneously what it is like to be eternally compassionate at the same time as what it is like to be me as a living mortal. And Brahman was ultimate reality, but also an apotheosis of my own consciousness, so

I was seeing this from both perspectives at once. And it was genuinely surprising to me to be told that my mortality was also key to the eternal existence of ultimate reality in it becoming manifest. Also the compassion for the mortal coil was uncanny and the message, although it looks like straight mass extinction avoidance was an affirmation from the Cosmos as a whole that life is the sacred key to everything, and that cosmic consciousness needs the existence of natural life to manifest it, without which the universe could become devoid of meaning.

I think from my experiences of tripping that this could also take very diverse forms that we see also in the Huichol art and the art of the Ayahuasca visions, so it's not a one way religious trip, but neither is it anywhere as narrow as many of the descriptions in the Eastern traditions convey.

Ram: If you are doing closed-eye meditation in TM, then how can you experience your internal and your external environment (external world) being unified? Are you doing open-eye meditation for unity subjective experience, which must have its own NPB (neural-physical basis)? Perhaps, we should do TM with eyes closed. If we like to test if the unity experience has occurred then open the eyes for a few seconds.

Chris: This quest is fallacious. It's essentially trivial to experience mind-world unity, so that raises a question about TM. Every scene we look at in normal life is expressing this unity, except we know the actual physical world is not coloured and is just waves and particles depending on what you look at. Therefore the entire notion of unity in the sense you are describing is a contradiction because you can only see what consciousness evokes external or internal.

Robert: Eyes closed is going inward toward the unified state of consciousness; eyes open is going outward toward to the environment, the field of diversity. In unity consciousness, the individual naturally enjoys the maximum value of both inner and outer existence simultaneously due to mind/body refinement and coordination of all levels of life.

Chris: Bob's comment is valid here. I do dual mode meditation when I am tripping. Eyes open for mindfulness and focus. Eyes closed for annihilation. The aim is to use both. Focus hard and steady and then let go completely. The purpose is not to try to artificially achieve unity which is a distraction. The aim is to go very deep into the dream and vision world of non-ordinary reality where unity with Brahman ultimate reality can manifest.

This is perfectly good neuroscience, which all scientists should appreciate! Quieten the default mode by stopping the internal dialogue and erasing personal history. Reduce sensory input to a minimum with perhaps a single candle in a darkened room or lying in the long grass among the crickets and grass hoppers by the shore in the moonlight and go into devoted vigil. Yogic breathing is key because breath is at the interface between autonomous volition and automatic as in sleeping, so letting go of breathing very gently is letting go of existence.

Ram: It seems that terms such as moksha, samadhi, consciousness, etc have multiple meanings depending on a point of view (POV).

Chris: No matter what form moksha takes, three things have to happen:

- (1) The subject has to have some sort of palpable experience of moksha consciously, so their consciousness has to be able to experience it and can't be completely disconnected.
- (2) They have to retain it in memory sufficiently to be able to recognise it and report on it physically afterwards.
- (3) The absolute key to the experience is perceiving existence from outside the round of birth and death because it is this which liberates and this IS moksha.

Robert speculates that moksha is a permanent state of samadhi but that doesn't describe anything different from samadhi which he describes a complete union of pure consciousness.

I have said repeatedly how this happens to me. That is I meditate, annihilate, fall into the experiential abyss, a non-ordinary experience overwhelms me and then a little later I catapult out of the situation with a fleeting awareness of my journey. This is also what the Huichol report:

"As the mara'akame descends and passes through the nierika on the return, his memory of the urucate and their world fades; only a glimmer remains of the fantastic journey that he has made" Don Jose Matsuwa (Halifax 242).

If you once experience moksha it almost forces enlightenment because it's like a covenant with cosmic reality. It becomes fundamental to one's continuing existence. That's why you get me pressing the point of Symbiotic Existential Cosmology with tenacious certainty. I don't have to experience it again and again and in a way that seems selfish unless I need to consult about something further along the way. That's why I don't need to meditate every day, or take mushrooms every week.

All the notions of "complete separation" are from spiritual doctrine, not personal experience. Also it's not clear what is separated from what and what separation means. I think the whole description is spiritual materialism, which is why all the astral worlds get caught up in it. Also you never make clear what's separated from what. I think its complete detachment of normal mind processes from physical:

- (1) You CAN'T experience moksha unless you abandon attachment to self, cease all mental activity and go onto another dimension and manage to get back from it. I think this is what the separation is about, not the complete separation of self-as-subject and all that other stuff from the physical world's existence because you can't separate consciousness from itself or it doesn't exist.
- (2) You ONLY have a successful moksha if you end up experiencing from outside the bubble of perception and can witness existence simultaneously from the organismic and cosmic perspectives and be both and see both in relationship.

That's how the experience becomes transfiguring and constitutes enlightenment. But it doesn't alter my morality, it just causes my karma to be transparent, so as not to raise the dust!

John: Wow. This is quite a wonderful discourse Chris, aside from its commentary on elements of theory.

Ram: why do you hypothesize that life is immortal when you know that we all are mortal, i.e., we will die one day? The psychedelic-based SEs are caused by ingestion of psychedelic herbs, so how can they be spontaneously (as a result of a sudden impulse and without premeditation; without apparent external cause or stimulus)?

Chris: The sexual generations of life are clearly immortal. It is only the individual organism that is mortal due to the entropic nature of the physical universe itself. Humanity has two great meditative traditions, the Eastern tradition and nature shamanism. The East uses (1) **physical control** – renunciation of our biological, social and sexual life, to avoid distraction from pure consciousness and (2) **mental control** to approach samadhi through stringent meditation in a context of mind-sky ascendent spirituality. The ascendancy of order and control eclipses the wild element of mystical transfiguration in favour of ordered etheric cosmologies, limiting the nature of samadhi.

By mind-sky, I don't mean the Zen mind-sky approach, but something much older. Men, fearing their mortality because they don't give live birth and appreciate the immortal passage of the generations in the "Mother Earth" way women can, have sought to control the tokens of culture and look to the sky and eternal existence as a transcendent extension of their conscious mind. We can see this in both Monotheism and the entire Vedantic/Buddhist complex. This means that the peak of transcendence is either associated with an omniscient omnipotent deity, or with primordial cosmic consciousness, or with emptiness itself.

By contrast entheogenic mysticism, arising from sacramental shamanism is spontaneous because it is empirical. It has no prescriptive doctrine and no attitude of mental supremacy over nature, but seeks animistic integration with the flux of life. We know evolution is not about the individual organism, but immortal survival of genes and species through (1) genetic recombination, (2) occasional mutation and (3) natural and sexual selection. Effectively it ensures the immortality of life as a whole by accepting the mortality of the organism, in the inevitable face of increasing entropy, to gain collective immortality of the diversity of life.

In fact sexuality is the ultimate cosmological expression of material selflessness, because it combines only half our genes with half the genes of our sexual partners, because this evades Muller's ratchet of cumulative mutational entropy that eventually kills off purely parthenogenetic species. This shows us the ultimate emergent sacredness of nature in living detail. Your approach that this is invalid and not sacredly immortal because we each will have only a mortal lifespan is a betrayal of the truth of life's immortal fertility, through fecundity and virility as Shakti is to Shiva, which is the only way humanity can experience true moksha.

What I am trying to explain to you is that the difficulty you and other spiritual thinkers have with this is precisely because your thinking remains locked in an eternal mind-sky world view that subjugates the immortality that the cosmic emergence of conscious life provides us. The reality is that there is nothing we can do about this situation. Life

has evolved in the best of all possible worlds. We simply can't afford to kick against the pricks, as Jesus said, and hunger for eternal life because it's forsaking the way the living conscious universe actually manifests.

Ram: I agree but the self-as-subject dies in your framework and the identity of a person is lost. We don't want to lose it. So Mother Nature needs to provide this intense desire similar to what she provided to monkeys on trees eventually evolving into us. In a similar way, through yoga/meditation, higher coevolution might have built 21 subtle entities in a bundle, which presumably survives death per Sankhya.

Chris: The self as subject **lives** in SEC. We are not alone Ram! Self as subject plays out in each and all of us. It's protected to be similar because of the way the mammalian brain has evolved. Don't look to your own eternity, but safeguard the immortality of life with your life as long as it lasts. It's the only framework in which we can exist as evolving biological beings with immortal meaning and tenure. The best of all possible worlds. Mother Nature doesn't pander to male desires for eternal life.

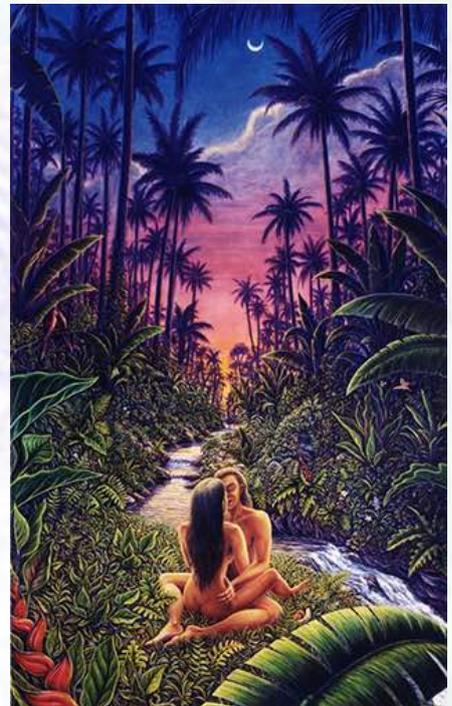

We still have the ultimate desire to live and beget life that all organisms have possessed since time immemorial. Existence desires from the very molecules of which we are made to generate life, even through abiogenesis, if all else is lost, and to regenerate again elsewhere in the universe or in the next universe. But that is no excuse whatever for pining for eternal life and allowing humanity to destroy life's immortality through spiritual hubris and domination.

Ram: Shiva (cosmic mind/consciousness, Purusha) and Shakti (universe, Prakriti) must exist simultaneously and inseparably. This is one of the reasons for postulating inseparable dual-aspect monism.

Chris: Shiva and Shakti are only inseparable at the origin in deep copulation. The dance is not, and even gives the dancer dances two different names: "Tandava is the dance of Shiva as the father of the universe, and Lasya, the dance of Shakti as the Great Mother of the World." Neither can a dance be simultaneous as it persists through time and us a contrapuntal relationship. We know they are then both figuratively coupled in the conscious mind and physical bodies of all of us, in the subdivided world of Maya but that is the existential condition we already know.

Fig 279: Shiva-Shakti tantra is unfolding cosmological fertility.

Ram: This is a misunderstanding. Shiva cannot exist without Shakti and vice-versa as inseparable dual-aspect monism (IDAM) all over space-time as explicitly expressed in ArdhNariEshvara concept still practiced in South India and perhaps also in Bengal. During Tandava, Shakti (*p*-aspect) is always present implicitly (hidden from viewers); otherwise, how and from where Shiva will get the energy to dance. Similarly, in Shakti's Lasya dance, she is conscious so Shiva (consciousness, *s*-aspect) is also always present implicitly. In all entities including us, both are always present explicitly and/or implicitly.

Chris: Yes I was waiting for your account. I agree, but it complicates matters further. I already added a sentence to my comment "We know they are then both figuratively coupled in the conscious mind and physical bodies of all of us, in the subdivided world of Maya but that is the existential condition."

The complexification is that you are conceiving of Shiva as consciousness with implicit "energy" and Shakti as physicality with implicit "consciousness". I agree but that's a role reversal that is complementary but not indistinguishable. This leads to a whole string of cosmological questions. Firstly physical materialism is Shakti without Shiva and the Vedic cosmic consciousness makes physical reality idea is Shiva making Shakti as gross aggregates of his consciousness. We come at best to the dream of Vishnu generating Brahma out of his navel, overlooked by Lakshmi as his "divine energy", bringing us full circle to Tantra again.

So let's view this scientifically. The dance of Shiva and Shakti is a creation myth of the Cosmos in which the entire universe is born from "sexual fertility". That sexual fertility requires the germinal "sperm" of Shiva as nascent consciousness and the enveloping ovum of Shakti as the nascent universe. Rather than a single dance in time, it is a representation of primal complementarity which is not a dualism because the cosmic sperm and ovum are already different. It is the story of Cosmic embryogenesis that is incarnate in all of us. The rest of the dance is the evolutionary dance of emerging sentient beings possessing both these asymmetric aspects, leading to the existential dilemma of human conscious existence in the mortal coil, where we are subjective sentient beings transforming the physical world at large in the generation and sustenance of mortal incarnations which are also sexual. At all points and in all features, Shiva and Shakti are never just indistinguishable dual clones, but complementary Cosmic principles, whose very difference is essential and must be respected and understood for the fertility of life to continue and for the interaction of subjective consciousness upon the physical world to occur. That's Symbiotic Existential Cosmology's ICAM (interactive complementary aspect monism) speaking!

There has to be at least one causal process for any realistic cosmological model of the universe. If there is no interaction, IDAM is simply saying the p aspect causality is the causal process i.e. physicalism. In IDAM, each s state is indistinguishably locked dually to the p state so s and p can't interact and s and s states cannot outside p causality either. This kind of duality is a homology e.g. in groups, equivalent multiplication tables and in topology, identical holes and twists i.e. isomorphism – identical form. Dualities don't have to be like this. AdS/CFT, which Uzi has finessed for consciousness, is a different kind of holographic duality between n -D gravity and $(n-1)$ -D quantum theory, but like IDAM it's a bijective duality and still epiphenomenalistic in Uziel Awret's cosmology. In IDAM there is thus no basis for any kind of causality or free will in the world of s states, because the p states are non-interactively causally closed and the s states are dual to p closure.

Dilemmas of Dealing with the Unshakeable Conviction of a Buddhist Philosopher about Consciousness

Ram: No! Causality is embedded in the co-evolution of dual-aspect states, adaptation, and natural selection. There might be multiple causes (or better conditions) for the generation of a new state from the previous state through the co-evolution from the dual-aspect unmanifested state of the primal dual-aspect substrate. As you know, if we involve causality then what would be the first cause? This leads to an infinite regress. Therefore, IDAM follows Nagarjuna's interdependent co-arising (IC) to keep track of multiple causes/ conditions, which rejects causality to start with and avoids the first cause. Nāgārjuna rejects 'inherent existence' or 'essence' in favor of co-dependent origination (or IC: Pratītyasamutpāda, प्रतीत्यसमुत्पाद), and that is also why he rejects causality; the entities that lack inherent existence dependently co-arise as elaborated in (Vimal, 2021). Causality is a major issue in metaphysical views, mostly because of the first cause that entails infinite regress.

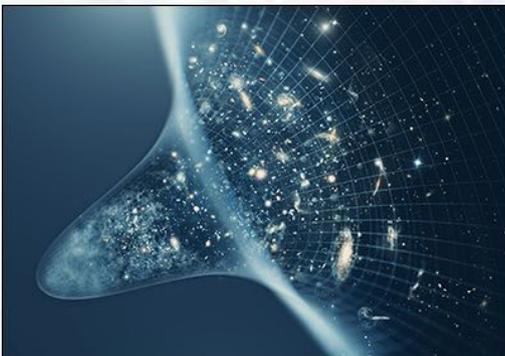

Fig 280: Shuttlecock universe (Hartle & Hawking 1983) suggests time may begin with the big bang like the "south pole" of a sphere in which latitude is time and longitude is space. This is still in hot debate as of 2019.

Chris: Well to me that's circular reasoning. I have major reservations about Nagarjuna's philosophy of causality. I don't see a problem with multiple causes, or with a first cause. I don't accept the philosophy of emptiness any more than the notion of no mind, or no self. I don't accept a nirvanic void or a model of Maya as it's nemesis. The universe is dynamic and I see causality as a principle of philosophical argument and deduction, rather than the functional equations of dynamic reality. But when you shoot someone dead, you and the gun and the bullet causes it in anyone's terms. Claims of causal closure of the universe likewise define the subjective versus objective relationship of materialism. This is not a question about causality, but the nature of time itself. SEC envisages a transcausal quantum time process where subjective existence has an evolutionary capacity to anticipate "potentia" of emerging quantum futures. Worrying about a first cause is a distraction in a big bang universe although I accept cyclic models of cosmology as a possibility, particularly evolving cycles.

Ram: From (Vimal, 2022b): Furthermore, "all phenomena come into being in dependence upon conditions, remain in existence dependent upon conditions, and cease to exist dependent upon conditions" (Nāgārjuna & Garfield, 1995 160). Nāgārjuna can grant "that effects are dependent upon collection of conditions, it cannot be that those

collections or that dependence exist inherently” (ibid 266). Moreover, individual conditions and their effects, the combination of conditions, and the inherent dependence of any phenomenon on the combination of all of its conditions lack inherent existence (ibid 258-266).

Entities lack inherent existence (because they are born and then die one day) and hence lack "real" causal power. Therefore, instead, he proposed interdependent co-arising and necessary conditions for an entity to manifest from emptiness/Shunyata (that presumably inherently exists), which is consistent with science’s quantum vacuum or “Nothing” (catchword for the materialist (Krauss, 2012)): Universe from Nothing).

Fig 281: Nāgārjuna

Chris: Nāgārjuna is a central figure in Buddhist and Tibetan Buddhist thinking, but he also epitomises what I see as the inherent negativity of the Buddhist view of emptiness and why I gravitate to the Upanishads as a source of true wisdom. Let’s take your statements as a whole, and I’ll reply to some paragraphs of Thubten Chodron’s [Grasping at Inherent Existence](#).

So there’s the view we have through our senses—but things do not exist the way they appear to our senses, which means we are living in a 100 percent hallucination without taking drugs. Everything that we perceive through our senses is false. We think that everything is out there: some kind of solid entity with its own essence, its own “thing” that makes it “it.” We think everything is real, objective, totally unrelated to the mind, totally unrelated to causes and conditions, just out there with its own essence. That’s how things appear to us—to our sense consciousness and to our mental consciousness—and we believe that. That’s wrong.

This is something anyone in the field of consciousness research is intimately familiar with, for example Anil Seth calls all experience “hallucination”. But this doesn't mean that conscious experience or physical reality is unreal, or invalid, or “wrong”. To survive in the living universe, this subjective sentience we have is essential for our survival. We need to take it as it is and do meaningful things as mortal beings to ensure the survival of life, just as animals do with great care to ensure their offspring survive. It’s not valid to say the transient nature of mortal life lacks inherent existence. To negate it in any way is not wise – nor actual wisdom. It also breeds an attitude of mind only ego angst not coupled to nature, or to the inherent existence and sacred value of life itself, or teach us to protect life with our physical lives.

If things did inherently exist—if they had their own essences and independent factors that were them—it would be impossible for them to exist. Why? Because then they would exist without depending on causes and conditions, and we’d have to ask, “How did they get produced? And, how do they change if they’re independent from causes and conditions?” So if things inherently existed, they could not exist at all. It is because they’re empty that they can exist. So “exist” means “dependently exist.”

The denial of inherent existence is simply a cover for denying the reality of everything because they appear to arise from other causes. One can fairly deny the entire hypothesis of relative negativity. The one thing we can’t deny is manifest existence. We are, whether we like it or not – whether we choose to or not – obligately conscious throughout our entire lives as living sentient volitional organisms – to say this is just an illusion and preach emptiness is not a remedy for ongoing life in its diversity and abundance – it doesn’t even recognise biological or genetic diversity as real or important, let alone sacred. This is also as you noted a deconstruction of our awareness of causality in a very physical universe, because it attributes cause and effect to the denial of inherent existence, leading to the doctrine of interdependent co-arising. Ultimately this philosophy is doomed to the Samvartakalpa or Eon of dissolution – the decline from enlightenment into ignorance.

The Buddha’s mind has two kinds of wisdom. There’s the ‘wisdom of varieties’ and the ‘wisdom of the mode.’ The ‘wisdom of varieties’ is the wisdom that perceives the variety of all the conventional truths. The ‘wisdom that perceives the mode’ perceives the mode of existence of all these conventional truths. Their mode of existence is that they’re empty. With these two wisdoms the Buddha’s mind perceives all existent phenomena—the conventional phenomena and their emptinesses—simultaneously. ... Also, when you’re perceiving conventional phenomena directly, you don’t at the same time have the direct realization of emptiness. When you enter into meditative equipoise as one of these arya bodhisattvas, then you perceive the emptiness of all phenomena. But at that time you can’t simultaneously perceive their bases, the conventional truths or conventional phenomena. So a high-level bodhisattva is always going back and forth between meditative equipoise on emptiness and subsequent realization whereby they perceive phenomena as like illusions. The phenomena still appear to them as truly existent, but they realize that things don’t exist as they appear, and that those appearances are illusory.

This to me is a self confession of the tragic emptiness of the mind-only or no-mind-only approach, where Buddhism, as an “adolescent” newcomer to the Vedic tradition, just as Christianity is to Judaism as the mother tradition, deviated from the Upanishads that appear to have preceded Buddha by a least a couple of centuries by denying the “self”. We are according to Thubten Chodron expected at all times to practice “equipoise” between real existence and the perception of voidness simultaneously to achieve release from grasping at inherent existence.

Contrast this with me taking a mild mushroom trip in June 2021 and having the satori that results in Symbiotic Existential Cosmology. I haven't had to spend the last 500 days equipoising between my perceptions of both the real world of biological survival along with my dreams and visions and the inherent emptiness of existence. I don't even need to meditate every day to stay sane. And I did it by "annihilation" meditation abandoning self, so in a sense I have denied the ultimate reality of atman to get there but “there” is life overflowing! I can live my life productively as a mortal being aware that any form of egoistical grasping is futile, but also aware that this fabulous Cosmos in which we exist is of inestimable sacred value, not just a void emptiness – that the evolving genetic and biological diversity of life is its sacred embodiment and consciousness is its omniscience. Sentient conscious beings are not emptiness seeking the void, but stand at the centre of the unfolding of the conscious universe perennially throughout our generations.

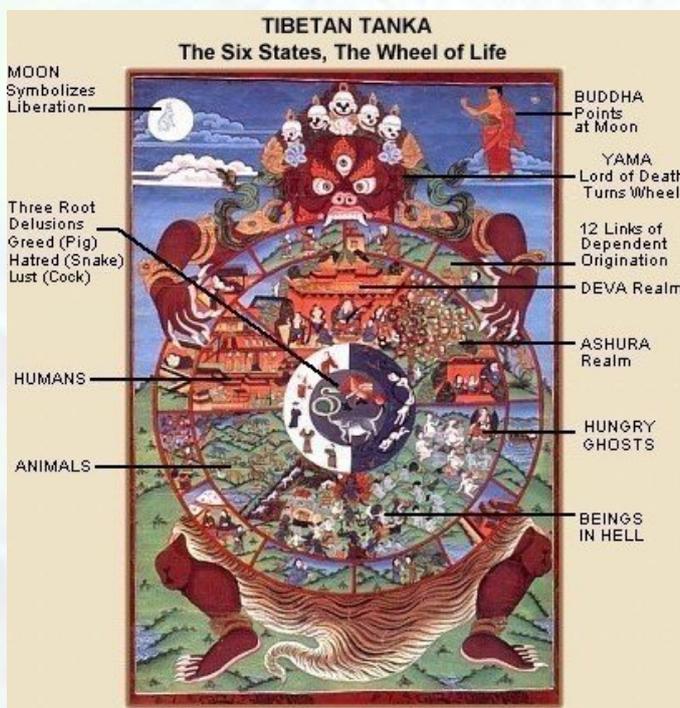

Fig 282: The Tibetan Buddhist cosmology of life. The worlds are, in ascending order of the degree of free will, compassion and happiness one feels, the worlds of: (1) hell, (2) hungry ghosts, (3) animals, (4) titans or asuras, (5) human beings (6) heavenly beings, (7) voice-hearers, (8) cause-awakened ones, (9) bodhisattvas, and (10) Buddhas. There are only two worlds of living species humans and animals. How do you tell an elephant from a butterfly? Where are the trees and fungi? An asura in Buddhism is a demigod or titan of the Kāmadhātu, described as having three heads with three faces each and either four or six arms. This is a non-biological fantasy like monotheistic angels and demons.

Joanna Macy (1991) in “World as Lover World as Self” on dependent co-arising begins with lamenting a world in trouble and has a chapter on the Greening of the Self. She even says “virtue is not required for the greening of the self, or the emergence of the ecological self. ... This ecological self, like any notion of selfhood is a metaphoric construct and a dynamical one”. So we have a Buddhist ecological activist trying to rationalise a cosmology of emptiness with compassion for the diversity of life. But it's the

ecology, through which life immortal survives, not the cosmology of emptiness, which is null.

Now this comes back full circle to causality and the plea by Nāgārjuna to qualify causality in interdependent co-arising. Where this entire philosophy comes apart is in its dependence on a view of reality in which subjective experience and the mortal ego are the only players.

Humans and all conscious organisms are believed to simply be reincarnated sentient beings. Their biology is essentially ignored, although many Buddhists practice compassion for living beings as conscious entities also caught in the mortal coil. The notion of interdependent co-arising only makes actual sense in an ecological symbiotic sense in which biological diversity is the sacred signature of the living universe, not just a delusory figment of Maya or illusion, misperceived as the void. Neither is this simply the quantum vacuum, as this rises within uncertainty to invoke every conceivable particle in the known universe, just as life is fecund in its diversity.

Ram kindly posted these passages from Mahathera's (2005) “Fundamentals of Buddhism”, in which the Buddhist notion of rebirth is highlighted in stark detail:

Buddhist doctrine of rebirth: With regard to this teaching, Buddhism is often accused of self-contradiction. Thus it is said that Buddhism on the one hand denies the existence of the soul, while on the other hand it teaches the transmigration of the soul. Nothing could be more mistaken than this. For Buddhism teaches no transmigration at all. The Buddhist doctrine of rebirth — which is really the same as the law of causality extended to the mental and moral domain — has nothing whatever to do with the brahman doctrine of reincarnation, or transmigration.

According to the brahmanical teaching, there exists a soul independently of the body which, after death, leaves its physical envelope and passes over into a new body, exactly as one might throw off an old garment and put on a new one. ... Buddhism does not recognize in this world any existence of mind apart from matter. All mental phenomena are conditioned through the six organs of sense, and without these they cannot exist. According to Buddhism, mind without matter is an impossibility. And, as we have seen, the mental phenomena, just as all bodily phenomena, are subject to change, and no persisting element, no ego-entity, no soul, is there to be found. But where there is no real unchanging entity, no soul, there one cannot speak of the transmigration.

How then is rebirth possible without something to be reborn, without an ego, or soul? ... What the Buddha teaches is, correctly speaking, the law of cause and effect working in the moral domain. For just as everything in the physical world happens in accordance with law, as the arising of any physical state is dependent on some preceding state as its cause, in just the same way must this law have universal application in the mental and moral domain too. If every physical state is preceded by another state as its cause, so also must this present physico-mental life be dependent upon causes anterior [forward] to its birth. Thus, according to Buddhism, the present life-process is the result of the craving for life in a former birth, and the craving for life in this birth is the cause of the life-process that continues after death.

But, as there is nothing that persists from one moment of consciousness to the next, so also no abiding element exists in this ever changing life-process that can pass over from one life to another. Nothing transmigrates from this moment to the next, nothing from one life to another life. This process of continually producing and being produced may best be compared with a wave on the ocean. The wave-structure that seems to hasten over the surface of the water, though creating the appearance of one and the same mass of water, is in reality nothing but a continued rising and falling of ever new masses of water. And the rising and falling is produced by the transmission of force originally generated by wind. Just so the Buddha did not teach that it is an ego-entity, or a soul, that hastens through the ocean of rebirth, but that it is in reality merely a life-wave which, according to its nature and activities, appears here as man, there as animal, and elsewhere as invisible being.”

This however deprecates the generations of life to a mere force of no value in itself. It becomes revealingly clear when we turn to birth where new life occurs where the above passage implies that it is only suffering which drives birth, rendering the entire flowering of the diversity of life to meaninglessness:

*There is another teaching of the Buddha which often gives rise to serious misunderstanding. It is the teaching of Nibbāna, or the extinction of suffering. This third noble truth points out that, through the cessation of all selfish craving and all ignorance, of necessity all suffering comes to an end, to extinction, and no new rebirth will take place. **For if the seed is destroyed, it can never sprout again.** If the selfish craving that clutches convulsively at life is destroyed, then, after death, there can never again take place a fresh shooting up, a continuation of this process of existence, a so-called rebirth. Where, however, there is no birth, there can be no death. Where there is no arising, there can be no passing away. Where no life exists, no suffering can exist. Now, because with the extinction of all selfish craving, all its concurrent phenomena, such as conceit, self-seeking, greed, hate, anger and cruelty, come to extinction, this freedom from selfish craving signifies the highest state of selflessness, wisdom and holiness.*

*Now this fact — that after the death of the Holy One, the Arahant, this physico-mental life-process no longer continues — is erroneously believed by many to be identical with annihilation of self, annihilation of a real being, and it is therefore maintained that the goal of Buddhism is simply annihilation. ... How is it ever possible to speak of the annihilation of a self, or soul, or ego, where no such thing is to be found? We have seen that in reality there does not exist any ego-entity, or soul, and therefore also no “transmigration” of such a thing into a new mother’s womb. That bodily process starting anew in the mother’s womb is in no way a continuation of a former bodily process, but merely a result, or effect, **caused by selfish craving and clinging to life of the so-called dying individual.** Thus one who says that the non-producing of any new life-process is identical with annihilation of a self, should also say that abstention from sexual intercourse is identical with annihilation of a child — which, of course, is absurd.*

Destroying the seed which drives birth so that it can never sprout is simply genocide. I checked this in the Pali Canon after Karen Armstrong (2022) in “Sacred Nature” has this charming quote intended to protect the diversity of life:

Let all beings be happy! Weak or strong, of high, middle or low estate, small or great, visible or invisible, near or far away, alive or still to be born — may they all be perfectly happy! ... Let us cherish all creatures, as a mother her only child!

But in [fuller translation](#), this passage ends with the same quick exit routine, deprecating the diversity of life:

This is said to be the sublime abiding. By not holding to fixed views, The pure-hearted one, having clarity of vision, Being freed from all sense desires, Is not born again into this world.

Mahathera continues:

*Here, once more, we may expressly emphasize that without a clear perception of the phenomenality or egolessness (anattā) of all existence, it will be impossible to obtain a real understanding of the Buddha's teaching, especially that of rebirth and Nibbāna. **This teaching of anattā is in fact the only characteristic Buddhist doctrine, with which the entire teaching stands or falls.***

So does the entire teaching FALL!

The first question "Has man a free will?" is to be rejected for the reason that, beside these ever-changing mental and physical phenomena, in the absolute sense no such thing or entity can be found that we could call "man," so that "man" as such is merely a name without any reality.

This is ridiculous philosophical sophistry. Man is not just a name – we are a biological species called *Homo sapiens* which is dominating and consuming the planet's biosphere as we speak. Man is both our fulfilment and our nemesis real and lethal.

The second question "Is will free?" is to be rejected for the reason that "will" is only a momentary mental phenomenon, just like feeling, consciousness, etc., and thus does not yet exist before it arises, and that therefore of a non-existent thing — of a thing which is not — one could, properly speaking, not ask whether it is free or unfree.

Incorrect. We do not know the source of will. One can validly argue that will is the creative force of the unfolding universe bringing it to consummating fulfilment. Without it the universe would be a wasteland with no conscious observer to manifest it.

It is rather with some hesitation that I dare to speak to you on that profoundest of all Buddhist doctrines, paticca-samuppāda, "dependent origination," that is to say, the conditional arising of all those mental and physical phenomena generally summed up by the conventional names "living being," or "individual," or "person."

This confirms that Buddhism is purely a psychological theory. It is not a biological or cosmological theory because there is only one class of being – the person.

This is the final goal and purpose of the Buddha's message, namely, deliverance from rebirth and suffering. And there is only one individual who no longer performs any wholesome or unwholesome kamma-formation, any life-affirming kamma. It is the Arahant, the holy and fully enlightened disciple of the Buddha. For through deep insight into the true nature of this empty and evanescent process of existence, he has become utterly detached from life; and he is forever freed from ignorance together with all its evil consequences, freed from any further rebirth.

"Utterly detached from life" is toxic to the diversity of living existence.

According to Buddhism, everything mental and physical happens in accordance with laws and conditions; and if it were otherwise, chaos and blind chance would reign. But such a thing is impossible and contradicts all laws of thinking.

This is completely false. Life exists at the edge of chaos, or everything gets stuck in the rut of the rule of law. Every principle of nature involves transcending such rigid boundaries. We thought DNA makes RNA makes proteins was Watson and Crick's central dogma of biology until Thomas Cech discovered reverse transcriptase. Now we know it powers our telomeres and came before DNA genomes became established, at the transition between RNA and DNA-based genomes. Likewise the standard model of physics arises from a quantum superforce breaking symmetry.

Therefore the Buddha has said: To believe that the doer of the deed will be the same, as the one who experiences its result (in the next life): this is the one extreme. To believe that the doer of the deed, and the one who experiences its result, are two different persons: this is the other extreme. Both these extremes the Perfect One has avoided and taught the truth that lies in the middle of both, that is: Through ignorance the kamma-formations are conditioned; through the kamma-formations, consciousness (in the subsequent birth); through consciousness, the mental and physical phenomena; through the mental and physical phenomena, the six bases; through the six bases, impression; through impression, feeling; through feeling, craving; through craving, clinging; through clinging, the life-process; through the (kammic) life-process, rebirth; through rebirth, decay and death, sorrow, lamentation, pain, grief and despair. Thus arises this whole mass of suffering.

This suffering is completely unnecessary. The only way the conscious universe can exist is through the unfolding evolution of the passage of the generations. It is to life spanning the mortal coil in immortal fertility that redemption of suffering arises. Not the emptiness of transient phenomena.

No doer of the deeds is found, No one who ever reaps their fruits.

*Empty phenomena roll on. This only is the correct view.
No god nor Brahma can be called The maker of this wheel of life:
Empty phenomena roll on, Dependent on conditions all.*

This is fatalistic negativity. Living phenomena are NOT empty, they are ever-flowing, naturally abundant, and in them our conscious realisation becomes fulfilled in the climax resplendence of life immortal.

Buddhism is an incomplete philosophy long past its use by date. The redemption of Tibetan Buddhism lies in its predecessor, Bon shamanism. The redemption of Zen is Shinto animism. When you spend time in Japan you come to realise births and marriages are celebrated in the Shinto shrines. Buddhism is rather the domain of death.

It is the underpinning of visionary animism for the consciousness of all life that is the living core of spirituality, not Buddhism, Vedanta, Monotheism, or any other cultural or religious system of imposed order. I never realised my duty would become the "slayer" of Buddhist doctrine. I have taken solemn Tibetan Buddhist vows to the dharma, but that is paradigm change!

Ram: Opponents could argue that if Buddhism's no-self doctrine is true, what is the purpose of reproduction? If there is no birth, then no life, no bad karma, no selfish craving, no old age, no suffering, and no death. If, for sexual climaxes, one reproduces and creates new life then children have to work hard to avoid selfish craving all life to minimize suffering. If Mother Nature, through coevolution, has provided the cycle of suffering and happiness, why suffering is so bad? Opponents could also argue that without suffering, there is no happiness and life will be boring.

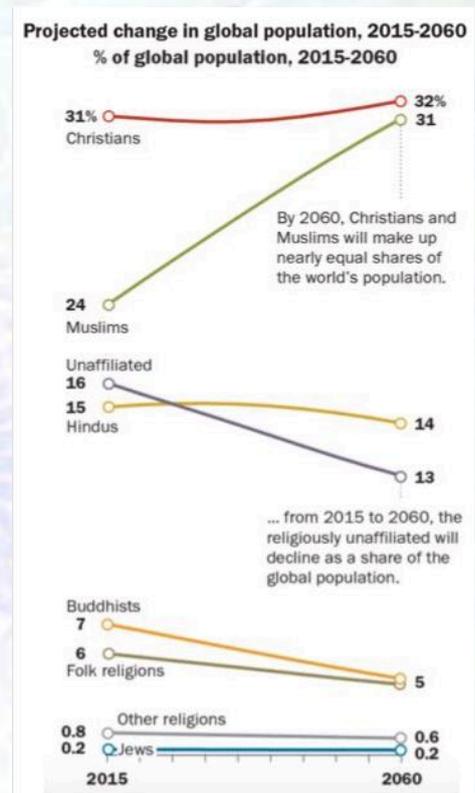

Chris: This is borne out by the fact that worldwide Buddhists are way below reproductive replacement rates at 1.5. The firebrand desert religions are breeding like rabbits, with Muslims on 2.9 and Christians on 2.6 (Pew Res 2017). Of course human overpopulation is not good for the biosphere, but tell that to the Christians and Muslims.

Fig 283: Population and religion (Pew research 2017)

But I would take this critique even further. It indicates that Buddha himself denied the significance and sacredness of life in a purely causal psychological and moral account which demotes the value of life against the notion of emptiness and constitutes a fundamental cosmological error from which there is no escape. This is why I see organismic mortality in the immortal flowering of the generations of life as the centre of the existential cyclone, with spiritual notions, even the persona of Brahman as an eternal figment of consciousness manifested in the biota through moksha. The mortal coil is where it all comes together in full physical and experiential completeness and where the universe unfolds.

Geewananda Gunawardana: As I understand, WBT, or what Buddha taught (Rahula 1959) is a way to understand reality, and it is highly compatible with science, not just neuroscience. There is one concept that science has not been able to provide an explanation. Yes, the WBT view of rebirth is very different. Without a permanent entity, what is there to be reborn or reincarnated? Rebirth (*punajjathi*) is not in WBT. The cause and effect that "connects lives" according to WBT is rebecoming (*punabbhava*). What I have not been able to understand from a science basis is a physical mechanism for rebecoming.

Chris: To understand your position on WBT it is to me of profound interest to understand the role biological life and its diversity and consciousness spread across the eucaryote kingdom means to you. You state you don't understand the mechanism of rebecoming but that to me is pivotal. Biological life is the key unique expression of sentient meaning in the universe. To survive, humanity needs to learn to appreciate the passage of the generations as a central and sacred phenomenon to have the will to protect the biosphere and ensure humanity's survival. But this also has a religious and spiritual dimension connected to the meaning of life, the universe and everything as Douglas Adams put it.

Geewananda Gunawardana: You had very relevant comments/questions pertaining to WBT. I am just as curious about WBT, and I have tried my best to respond to them. The five aggregates, [sensations (or feelings), perceptions, mental activity and] consciousness, is the mechanism by which humans become aware of their environment and respond to it to perpetuate life. It is this force to perpetuate life WBT (what Buddha taught) identifies as *tanha* (craving, thirst, desire). Therefore, WBT is about life, here and now. WBT recognizes a continuum of consciousness among all living beings including humans. Life, human or otherwise, is the most important/sacred thing, and WBT is all about getting the full use of it here and now, not in a next life. ... As life is a product of an endless chain of causes, effects, and conditions, WBT does not assign a meaning to life. To do otherwise would be to subscribe to creation or design theory. Here, the purpose does not include the individual choices we make.

Chris: I see a fundamental inconsistency between these statements. You are claiming (1) That WBT claims life is perpetuated through craving. (2) That WBT claims this life is important/sacred (3) That because life is a chain of cause and effect life has no meaning (assigned). In effect here, life is just an endless chain of craving that is there to support enlightenment where the process stops. This relegates life to a secondary status as *Maya* or illusion except as an opportunity for *moksha*. It is a matter of crucial concern in an era of planetary mass extinction.

To say assigning a meaning to life implies creationism or intelligent design is a false conclusion. Evolution displays creative adventitious idiosyncrasy. The very involvement of occasional mutation means that genuine novelty arises in ways associated with quantum indeterminacy that can't be predicted. Consciousness has the same features, which are fundamentally causality violating, so the idea of interdependent co-arising is a classical mistake Buddha hadn't anticipated. To fail to assign any meaning to life while claiming it is sacred is a tragic mistake.

Geewananda: According to WBT, consciousness is a result of biological life (five aggregates) and not the other way around. If you work back the cause-and-effect process, it becomes a vast net, in which all living beings are interconnected and interdependent. Not to mention the environment - conditions.

Chris: Yes multiple causes in a network but only as a psychological process. No reference is made to species differences, or the intrinsic core value of mutation as a source of genetic novelty because real biological and neuroscientific detail is beyond the scope of 2500 year old thinking. To say WBT is entirely compatible with science is like claiming Genesis 1 captures the essence of cosmic evolution by inventing six phases: big-bang, galaxies, stars and habitable planets, biogenesis, evolution and conscious eucaryotes to explain it.

Geewananda: They all fall within the three characteristics of life – *anicca dukkha*, *anatta*, and cause and effect.

Chris: *Aniccā* (impermanence), *dukkha* (commonly translated as "suffering", "unsatisfactory", "unease"), and *anattā* (without a lasting essence), are all fundamental negatives. To make a quick response to this, Symbiotic Existential Cosmology sees mortal life as the centre of the cyclone of reality, while eternal life and emptiness are illusions. Rather than letting go of grasping, it is more direct to accept mortality, thus realising that selfish aims are futile and giving our creative inspiration to flowering life as a whole. This ensures planetary survival and is a positive redemption transcending the negative remedy of WBT. It invokes an immortal emergent unfolding nature for transcendent consciousness as the consummation of cosmic evolution. It's fully life positive, and fully transfiguring through our ability to achieve *moksha* through symbiosis with all conscious life.

Geewananda: The problem as WBT recognizes it is that the *tanha* or life force (the urge to ensure the perpetuation of one's own DNA) renders one's mind to be selfish and overlook the wellbeing of other creatures and the environment.

Chris: But it is sexuality which heals genetic selfishness and mortality which heals not caring for the diversity of life, but investing in its flowering. We contribute only half our genes to the next generation. WBT never understood or knew this. It is only with the discovery of DNA and the intrinsic unselfishness of sexual recombination and the genotype-phenotype relationship that we can see the real network details. Independent co-arising is just a psychological network metaphor. Mortality means the only act of significance we can make are for immortal life as a whole.

Whit Blauvelt: As for your notion of Buddhists' supposed view of "egotistical grasping," the Tibetan Book of the Dead contains instructions for identifying whether a copulating couple is doing so of purest love – the preferred family to be reborn in. This hardly seems compatible with your claim as to Buddhists' view of procreation.

Chris: Any Buddhist would want to be born to a couple where grasping ego is minimised. Being born in a dysfunctional family is an unfavourable sign of your own misbehaviour in the life you are leaving. It seems you can't accept the reality that the suffering of the round of birth and death is driven by the grasping ego, not enlightenment, which enables us to see outside it in this lifetime. Even the Bardo Thodol is consistent with this.

Whit: Perhaps the search for a "characteristic doctrine" [like anattā] is more a Western scholarly comparative religion pigeon holing? If some large number of people were to suddenly become enlightened, how could that not disrupt society? Many of us are living in ways which are incompatible with enlightenment.

Chris: Enlightenment without is much more of a challenge than claimed enlightenment within. It's why turning the tables is also necessary, even if they were there to avoid Roman coins entering the Holy of Holies! Even if you treat the doctrine of emptiness and grasping rebirth metaphorically in the most favourable light, e.g. in interdependent co-arising, it leaves life itself critically vulnerable as a surrogate hostage to emptiness. This is why life and its flowering diversity are the "mothers of enlightenment". **No enlightenment that is less than symbiotic will ultimately survive.** Each religious tradition has its Achille's heel. Monotheism has destructive apocalypse. Eastern traditions subtly demote nature to psyche in a way which is equally transgressive to resplendence. Both cosmologies are naturally degenerate.

Whit: You've rediscovered something at the core of some Eastern traditions. Insisting that your way is the only way -- isn't that a flaw of every fundamentalism? Fundamentalisms may be good, to some real degree. But are they ever best?

Chris: Fundamentalism is strict adherence to a religious doctrine. SEC is empirical cosmology. Spirituality without symbiosis cannot survive as a cultural meme in evolutionary time. It will either participate in a mass extinction of life to our demise or it will be discarded by human culture as wanting. 2500 years since the sages is a drop in the ocean. I didn't say "my way is the only way" and my actual statement is true.

Whit: None has ever achieved this true vision before yourself? Isn't "symbiotic" in your usage also a metaphor, one which overlaps with the "interdependent co-arising"? Could your insight be of high value, yet not unique?

Chris: Independent co-arising is a false cosmology. It's simply a metaphor neglecting nature in favour of sentient beings that may be grasping humans from past lives. Trying to claim an inspiration is just an echo of ancient wisdom is counterproductive. The core of Symbiotic Existential Cosmology is biospheric symbiosis. The key concept of eucaryote symbiosis dates to Lynn Margulis (1967). The word dates to only the 19th century, not Buddhist doctrine.

Symbiosis (n.) 1876, as a biological term, "union for life of two different organisms based on mutually benefit,"

Whit: A fresh discovery of something which has been discovered before. It is essential that people continually freshly discover certain truths -- things which are best known directly, and not just known through the accounts of others. There are other classes of truths where second-hand knowledge will largely suffice. But there are essential matters which are best approached shamanically, as you have, rather than through the authority of priests. Even with truths discovered, and written of, many times over the centuries, there can be great value in yet more writings about them.

This is productive! Keep up the good work. Just, maybe, back off on the claim that your map is superior to all other maps. That sort of claim too often leads to wars between religions, even when the variations in their maps that each claims the superiority of has little to do with the destination arrived at by those who manage to use those maps to get to the central insights themselves.

Chris: It is not an abstract map of reality -- it's life and life only -- the weltanschauung of immortal survival.

Whit: The "full human symbiosis" of your ideal models a far more radical transformation, likely to meet strong resistance from the "immune systems" of the world's various societies. The Russian Revolution once seemed to many bright people a coherent hope against the ongoing crisis of destructive economic exploitation. The side effects of the radical treatment were worse than the disease. We're best with some humility in the solutions we proffer, as they may reveal dangerous flaws when pressed into practice by larger numbers.

Chris: Can you not see the inconsistency of claiming the symbiosis of Symbiotic Existential Cosmology was on the one hand anticipated by Buddha through interdependent co-arising and citing fundamentalism and the Russian revolution about it on the other? Symbiotic Existential Cosmology is the most pro-life and pro-survival work ever conceived. It is neither threatening nor dangerous.

I am, through Symbiotic Existential Cosmology posing a challenge, not just to science and philosophy, but to Monotheism and its description of reality as a divine creation and to the Buddhist philosophy of mental only nihilism of no-mind that sees all phenomena, both conscious and physical as illusion, and stipulates only emptiness as the solution, when the universe is overflowing with immortal climax diversity in natural abundance. I have a rightful duty as a scientific and spiritual innovator to do this. The world is in existential crisis and I have to act, but to act carefully to avoid destructive apocalypse. I have to be decisive and make an unswerving truthful account of reality as I experience and observe it. I don't and cannot submit to any previous philosophical "authority" whether Ryle or Nāgārjuna or any guru, as a naked noble savage speaking transparently, while there is still time enough to fertilise the unveiling.

It's possible for Buddhist compassion to be helpful and insightful when taken metaphorically, but Buddhist doctrine is fundamentalist in claim.

Ram: In all frameworks (including the Vedic system, SEC, IDAM, and science), death is inevitable; there is no escape from death, unfortunately. In SEC also, after moksha, we have to return back to where we came from. In science, once death embraces us, we are gone forever; the whole universe will eventually die. Why is death taken so negatively in Buddhism? Yes, if we are not born we will not face dukkha/suffering, but what is new in this hypothesis? In the Vedic system, after moksha, we as eternal atmans merge with (ie., return back to) the source Brahman. This is why whatever is happening is called "Leela"/ play. Enjoy it!

Chris: I think this statement of Ram is holding a deep insight which is key to the whole phenomenon of life and death. I'm beginning to understand from these discussions the extent to which our knowledge of Brahman or the cosmic mind is only beginning. That there is a huge significant reality out there and in here, that we are only scratching the surface of, even in all traditions put together. And like the scientific revolution, the answers are going to be confoundingly different from our expectations, so the vision quest is discovering that reality. This is a profound huge journey we have only just begun and it needs to be pursued as the root discovery process it is, without any prior doctrinal assumptions, but we need to approach it with joie de vivre – ecstasy even – and ride over the realities of suffering in the mortal coil.

Symbiotic Existential Cosmology introduces a novel element, in that the purpose, or meaning of existence, is not just enlightenment but the preservation and flowering of life immortal in a sentient universe pulling itself up by its bootstraps into a revelation of full cosmic consciousness. Humanity's role on Earth is thus the protection of life and its diversity as our "sine qua non – raison d'être". I contend this is new and is much more than just being compassionate to sentient beings. Nor is it Chardin's Christogenic "noosphere", but a real biological manifestation of conscious life immortal in the passage of the generations compensating for organismic mortality, because this is the only way cosmic consciousness can come alive in the physical universe of fermions and bosons and entropic thermodynamics, held back by the negentropy of life itself.

Whit: The origin of the word "dukkha" is of the axle whole being off center. So Buddhist practice is about getting the wheel to roll more smoothly, getting the 8 spokes into dynamic balance, into symmetry. "Dukkha" is not well-translated as "suffering." It's not about "ego." Buddhists were never Freudians. But the slight similarity is that Buddhists hold the wheel gets out of true when we see ourselves only as separated rather than also as whole with the world -- the conception of the wholeness of wholeness and separation, which of course is not unique to Buddhism.

Chris: I agree with you about the notion of dukkha and the unbalanced wheel. This means that Buddhism is three things: (1) A practical art of balancing, to enter in to psychological balance in the world of "mundane existence" amid grasping desires. (2) A quasi-scientific cosmology which is atheistic and preaches impermanent co-arising dynamics reaching toward an enlightenment free of fixed assumptions it calls "emptiness" for want of a better word. (3) The traditional Eastern cosmology of reincarnation to tie it all into a moral framework, which I believe is a false morality, although karma is real. The difficulty I see with this is that emptiness is empty and Brahman is full to overflowing and in need of further exploration and discovery.

Whit: The Dalai Lama says the concept of original sin was the hardest thing for him to understand about Christianity; there's nothing like it in Tibetan Buddhism. Christians also worship Christ's suffering on the Cross. The concept doesn't fit Buddhism; it's a translation as simple as it is wrong.

Chris: I want to explain how SEC treats sin and evil. The Western tradition tends towards a dualistic apocalyptic model of good and evil and Eastern traditions also invoke a moral causality ending in a Kali Yuga. The Western tradition pictures sin as rebellion against God's will in an extrapolated eternal cosmology in which temptation becomes literally excruciating. There is a contradiction here in that this is a uniquely human phenomenon. Intelligent animals do not experience natural evil because each species has a role in the biospheric ecology that is held together by biospheric selection across the generations, so that carnivores actually keep the herbivores in balance from boom and bust extinction and the herbivores keep the plants in balance. Even Covid is a virus, whose niche is symbiotic with bats, that was knocked off its perch by human exploitation of wildlife, and rabies and ebola are self-limiting in a diverse ecology.

In this sense the other species ARE enlightened because, often in great hardship they strive to protect and nurture their young, but Buddhist cosmology anthropocentrically sees humanity as the only intelligent species capable of full enlightenment and stepping off the wheel of life, fig 213, to no constructive outcome cosmologically.

Thus there is really no such thing as natural evil and this teaches us a lesson about what evil actually is – a product of humanity becoming a cultural phenomenon, giving rise to cultural forms of evil when the power of potentates extends far beyond looking after their offspring and involves destructive ways of domination and destructive social behaviour driven by forms of psychopathy which can survive only in a rapidly evolving cultural context. Basically pure evil, aka original sin, is a product of cultural actions which directly or indirectly predispose to the breakdown of humanity's relationship with the biosphere as a whole in forms of exploitation that indirectly risk extinction of both humanity, and the other species. We all become complicit in this, unless we dedicate our lives to protecting the diversity of life as a whole. We have no idea whether humanity can survive as a dominant species and other species may need to take over the beacon of illumination. By killing off the primates through neglect and habitat exploitation, we are killing off our own prospect of collective survival.

Whit: Please suggest a "trivial" method that a normal person can use to experience mind-world unity, short of dosing on psychedelics. It seems that most people, at least in Western culture, don't commonly experience this. Are you saying it's uncommon, yet trivial? Considering that it's generally reported as a nice state to be in, if the experience is trivially accomplished, why is it not central to our cultural practice and attitude?

Chris: My comment was about TM, not entheogens, but the long struggle of Western civilisation and sacramental religion hasn't been for naught. Psychedelics were repressed because Christian culture abhors novel heretical vision. Gnosticism regained new life during the Crusades and infected Europe and was violently suppressed. At the same time the old European Goddess, whose participants took nightshade and henbane, were burned at the stake.

In 1209, a crusade from Pope Innocent III began against the Cathars. Both Cathars and Catholics were besieged by an army of the Church within the walls of Beziers. On the day of the feast of Mary Magdalen they killed their viscount in the church dedicated to her name and were in turn horrendously punished on the same day for repeating the Albigensian heresy that she was Christ's concubine. When the city fell, the commanding general was asked who to slaughter: heretics, his men assumed, must surely be separated from believers:

"Kill them all," he said, "the Lord will know his own". Our forces spared neither rank nor sex nor age. About twenty thousand people lost their lives at the point of the sword. The destruction of the enemy was on an enormous scale. The entire city was plundered and put to the torch. Thus did divine vengeance vent its wondrous rage.

Psychedelics were banned in like style in the US and then the world from 1966, until the early 2000s when scientific research began to establish their therapeutic and transformative value on an empirical basis. This trend is continuing. Natural entheogens have been respected as sacred by every culture that has discovered them, so you talking this way is narrowly ethnocentric. My statement above remains true. I am not responsible for the sappy neurochemical brain, or the fact that the biosphere has evolved to modify it, including many of our essential medicines and the biospheric sacraments that provide an essentially trivial access to realisation when accompanied by good guidance and meditation, by comparison with repeated lifetimes in the Eastern traditions.

Regarding Buddhism, Vedanta and Psychedelics, in 1996, Tricycle the Buddhist magazine had a special Issue with the Editorial "Just say maybe" on psychedelic use. The lead article in the issue was Rick Fields' "A High History of Buddhism in America", which has since become a chapter in "Zig Zag Zen: Buddhism and Psychedelics" (Badiner & Grey A 2015).

This contains a positive view of the history of psychedelic Buddhists and Vedantists in the US and in the East. He notes: "Now, in the new century, we may be seeing a generation who has steeped themselves in practice become inspired to take another, more mature—and more penetrating—look at psychedelics."

He provides a run down of the journeys of Ram Dass and others to India meeting both Lamas and Yogis. Note that the largest dose Ram Dass's guru Karoli Baba has was 1200 mics which IS large but I have had many 1000 mic trips, so this isn't "mind boggling" and he also claimed medicines were used in the Kulu Valley, but the yogi's lost the knowledge:

Before long, a number of the psychedelic luminaries made their way to India. In 1966, Ralph Metzner introduced Timothy Leary to the German-born Lama Anagarika Govinda, who lived in Evans-Wentz's old cottage in the Himalayan village of Nanital. "The lama had been most impressed to learn that The Psychedelic Experience contained a dedication to him," Leary wrote in Flashbacks (Leary, 1983). Govinda had requested an LSD session, which Metzner provided. For the first time, after thirty years of meditation, the lama had experienced the Bardo Thödol in its living, sweating reality. According to Leary, Govinda told him that "many of the guardians of the old philosophic traditions had realized that the evolution of the human race had depended upon a restoration of unity between the outer science advanced by the West and the inner yoga advanced by the East." The teachings of Theosophy, Gurdjieff, Ramakrishna, Krishnamurti, and Evans-Wentz's translation of the Tibetan Book of the Dead had all been part of this plan. "You," the lama told Leary, "are the predictable result of a strategy that has been unfolding for over fifty years. You have done exactly what the philosophers wanted done." Presumably referring to Gerald Heard and Huxley, he said, "You were prepared discreetly by several Englishmen who were themselves agents of this process. You have been an unwitting tool of the great transformation of our age."

Ginsberg arrived in India that same year. Lately his psychedelic visions had become frightening, and he was wondering if he ought to continue. In Kalimpong he visited Dudjom Rinpoche, the great yogi-scholar who was head of the Nyingma (Ancient Ones) lineage. "I have these terrible visions, what should I do?" he asked. Dudjom Rinpoche sucked air through his mouth, a traditional Tibetan sign of sympathy, and said, "If you see anything horrible, don't cling to it; if you see anything beautiful, don't cling to it."

Leary's partner, Richard Alpert (now known as Ram Dass), reached India in 1967, "hoping to find someone who might understand more about these substances than we did in the West." When he met his guru, Neem Karoli Baba, Ram Dass gave him a hefty dose of nine hundred micrograms. "My reaction was one of shock mixed with the fascination of a social scientist, eager to see what would happen," Ram Dass wrote. "He allowed me to stay for an hour—and nothing happened. Nothing whatsoever. He just laughed at me."

Another time the old man swallowed a mind-boggling twelve hundred micrograms. "And then he asked, 'Have you got anything stronger?' I didn't. Then he said, 'These medicines were used in Kulu Valley long ago. But yogis have lost that knowledge. They were used with fasting. Nobody knows how to take them now. To take them with no effect, your mind must be firmly fixed on God. Others would be afraid to take. Many saints would not take this.' And he left it at that" (Dass, 1979).

Despite experiments by and some opposition from Roshis, psychedelics combined with the wisdom traditions did have transformative effects on awareness:

Of course, the voyage was not always necessary. In his 1967 essay "Passage to More than India," Gary Snyder wrote, "Those who do not have time or money to go to India or Japan, but who think a great deal about the wisdom traditions, have remarkable results when they take LSD. The Bhagavad Gita, the Hindu Mythologies, The Serpent Power, the Lankavatara Sutra, the Upanishads, the Hevajra Tantra, the Mahanirvana Tantra—to name a few texts—become, they say, finally clear to them. They often feel that they must radically reorganize their lives to harmonize with such insights." At times, as Snyder noted, the psychedelic experience led straight to meditation. "In several American cities," he wrote, "traditional meditation halls of both Rinzai and Soto are flourishing. Many of the newcomers turned to traditional meditation after initial acid experience. The two types of experience seem to inform each other."

It was impossible for any roshi to ignore the question of LSD and its relationship to Buddhism. Koun Yamada Roshi, Yatsutani Roshi's chief disciple in Japan, was said to have tried it only to report, "This isn't form is the same as emptiness; this is emptiness is the same as form." If Suzuki Roshi said (as Gary Snyder told Dom Aelred Graham) that "people who have started to come to the zendo from LSD experiences have shown an ability to get into good zazen very rapidly," he also said in New York (as Harold Talbott, Graham's secretary, told Snyder) "that the LSD experience was entirely distinct from Zen." In any case, it seemed that in practice, Suzuki Roshi mostly ignored it. When Mary Farkas of the First Zen Institute asked him what he thought of the "Zen-drug tie-up we kept hearing so much of," she gathered from his reply "that students who had been on drugs gradually gave them up and that highly structured and supervised activities left little opportunity and lessened inclination."

Alan Watts notes yoga or Zen giving the meditative grounding to handle psychedelics without going over or under:

Alan Watts was more sympathetic. He pointed out, to begin with, that everyone must speak for himself since so much depended on the “mental state of the person taking the chemical and circumstances under which the experiment is conducted.” In Watts’s case, these had been benign, and LSD had given him “an experience both like and unlike what I understood as the flavor of Zen.” His mind had slowed, there were subtle changes in sense perception, and most importantly, “the thinker” had become confounded so that it realized “that all so-called opposites go together in somewhat the same way as the two sides of a single coin.” This in turn had led to an experience of what the Japanese Buddhists call *ji ji-mu-ge*, the principle of universal interpretation.

But if one were not trained in yoga or Zen, warned Watts, this insight might lead one to believe either that “you are the helpless victim of everything that happens to you,” or that, like God, you are “personally responsible for everything that happened.” To go beyond this impasse, one needed either “an attitude of profound faith or letting-go to you-know-not-what.” In that case, “the rest of the experience is total delight ... what, in Buddhist terms, would be called an experience of world as *dharmadhatu*, of all things and events, however splendid or deplorable from relative points of view, as aspects of symphonic harmony, which, in its totality, is gorgeous beyond belief.”

Opinions varied from “intoxicant prohibition” to “positive exploration”:

With the advent of actual practice came Buddhist critique of the psychedelic experience. Some teachers slotted drugs into the mind-intoxicant category of the precepts. This was not really convincing for many, however, because whatever psychedelics might be, anyone who had taken them knew that “intoxicating” was a limited, reductionist description, at best. And more often than not, the Asian teachers making such pronouncements had no actual experience of psychedelics.

The few teachers who did have such experience, however, were in a uniquely privileged position to compare the two experiences. The most sympathetic of these was Trungpa Rinpoche, who had tested and tasted the splendors of Western civilization in England. He was one of the few Buddhist teachers one could talk to about such things, which many of his students—myself included—asked him about. Officially, of course, all illegal drugs were prohibited. But privately Trungpa Rinpoche had, as he told me (and here I paraphrase loosely from memory), a lot of sympathy for students who had taken LSD. He even volunteered that we might take it together sometime in the future—an opportunity or challenge that I never got to take him up on, to my regret and relief. The suggestion was both exhilarating and scary. His style and skill, after all, lay in cutting through trips of spiritual materialism rather than guiding them.

He notes that discrete use of psychedelics has been going on throughout by mature Buddhist practitioners, many of whom had previously taken psychedelics:

Such was the powerful antidrug drift. As always, however, there were countercurrents. During the seventies and up to the present, a small number of committed Buddhist practitioners have used the sacrament in the context of formal practice. This was necessarily a secret use, harking back to the earliest tantric circles in India, where unlawful and taboo substances such as meat and wine were transformed into sacraments. This group was naturally self-selecting, composed mostly of practitioners experienced in both modalities, who found that, handled properly, psychedelics can be a useful skillful means. If the practitioner has the balance and moves to surf the psychedelic waves, the argument went, then the experience can be useful in one’s *sadhana* [formal practice]. Myron J. Stolaroff, active in psychedelic research since 1960, is one of these Buddhist practitioners. “For myself,” he wrote in *Gnosis* in 1993, “I found training in Tibetan Buddhist meditation a potent adjunct to psychedelic exploration. In learning to hold my mind empty, I became aware that other levels of reality would more readily manifest. It was only in absolute stillness ... that many subtle but extremely valuable nuances of reality appeared. While I achieved this to some extent in ordinary practice, I found this effect to be greatly amplified while under the influence of a psychedelic substance. This in turn intensified my daily practice.”

He notes the Peyote ceremony which I have also attended and can confirm his observations as to its ritually meditative character. He points out the story of Buddhism and psychedelics is hardly over and the entheogenic shamans and Ayahuasca churches have a lot to teach the traditions:

The all-night Native American Church ceremony, for example, combines the discipline and mindfulness of a Zen ritual, the spontaneous song prayer of the Tantric *doha* tradition, and the compassion of the *bodhisattva*. I remember one night in a tepee in northern Montana, the clear mind of peyote glowing in the fire before the crescent-moon sand altar, the thump-thump-thump of water drum and gourd rattles keeping time with the ancient peyote songs—and it was clear as the dawning light that something close to this went on way back, possibly to the dawn of our human consciousness.

And why not into the future as well? We have much to learn from indigenous shamans. Both the Native American Church and the Brazilian ayahuasca churches have successfully grafted an ancient entheogenic practice onto Christianity. There is nothing to prevent this from happening with Buddhism as well. Indeed, Buddhism has demonstrated a genius for adapting—or mutating, in Professor Robert Thurman’s phrase—to a wide range of cultures. In Tibet, this included a shamanistic culture. Whether or not the ancient *siddhas* used mushrooms or other alchemical substances, there is no reason why an ecologically informed American Buddhism cannot likewise draw from shamanistic earth-wisdom. Sacred plant sacraments could be offered as *amrita* in the context of a tantric feast, for the development of compassion and wisdom in our ravaged world. At least for the tantric lineages of Buddhism there is no limit to the skillful means available to a *bodhisattva*, which includes many teachings on transforming poison into nectar. As unlikely as it may seem, this devil juice may be just the antidote for the out-of-control materialism that is ravaging our planet.

One thing at least seems certain. Whatever the ancient or recent past history of psychedelic entheogens and Buddhism may be, the story is hardly over. As Hajicek-Dobberstein says, "Some contemporary non-orthodox Buddhist 'alchemists' find precedents in Mahasiddhas Nagarjuna and Aryadeva, who agreed, 'We need to eat the alchemical medicine'... Orthodox scholars may object but they can no longer 'Just Say No'".

Ram: Self-grasping (Skt. ātmagrāh) — often translated as 'ego'. Sogyal Rinpoche writes[1]: "[...] Ego [...] is the absence of true knowledge of who we really are, together with its result: a doomed clutching on, at all costs, to a cobbled together and makeshift image of ourselves, an inevitably chameleon charlatan self that keeps changing and has to, to keep alive the fiction of its existence. This is what is known as the 'ego' or dak dzin in Tibetan, which means 'grasping at a self'. Ego is defined as incessant movements of grasping at a delusory notion of 'I' and 'mine', self and other, and all the concepts, ideas, desires, and activity that sustain this false construction."

I don't see why rebirth is due to self-grasping. Let us suppose self-as-subject (atman) is eternal as the Vedic system hypothesizes. In that case, I will try my best to do good karma to avoid suffering/dukkha in the current birth and reduce a load of bad karma for future births and then enjoy life after death because of my good karma as per Sankhya. Then reincarnate in a good family as a reward of my good karma. This birth-death cycle will continue until I get moksha.

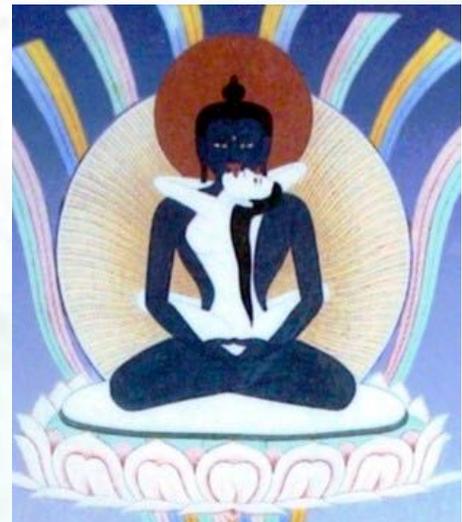

Chris: Ego doesn't arise from grasping at an illusory self. It arises from grasping at fame, fortune, power and other illusory achievements like massive publication lists, rather than paradigm shifting insights. Ego is a real evolutionary survival process in which the self is in an attempt to immortalise itself as long as possible against environmental or social threats, and to gain power over arbitrary twists of fate. This becomes compounded in culture on a scale that exceeds animals caring for their young and becomes tales of potentates vying for cultural ascendancy.

Sogyal is just doing what expounders of the doctrine have to do to rationalise the emptiness of emptiness. They have to make a subtle shift of the frame of reference to make the doctrine seem real, while everything else is in flux, so they turn it into ego not being for survival but false grasping at the illusory self. No one actually suffers from this malady. The self is no more an illusion than external perceptions of reality. It is the inner complement to the universe which gives us our identity and agency to survive in the world. Buddhism also negates both identity and agency by saying nothing has inherent existence but that yet again is a doctrinal device to make an inconsistent view appear consistent.

Sogyal Rinpoche is an expounder of Dzogchen (Skt. Atiyoga; Tib. རྫོགས་པ་ལྷན་པོ་) — the 'Great Perfection', or 'Great Completeness'. The practice of Dzogchen is the most ancient and direct stream of wisdom within the Buddhist tradition of Tibet, realising Nirvana through visualisation. It is shared by the Ningmapa trait of my lama, Yeshe Dorje who had a Tibetan wife and seven children in Macleod Gang, but went to the US and had an American partner. Sogyal Rinpoche describes it as "the heart-essence of all spiritual paths and the summit of an individual's spiritual evolution".

However Sogyal Rinpoche had to **resign in disgrace** for sexually and physically abusing his followers and died shortly after. If you glance at the image of the perfect Buddha Samantabhadra, draped with the passive figure of his sexual consort Samantabhadri, you might understand why this happened.

Fig 284: Samantabhadra the primal Buddha, draped with the passive figure of his sexual consort Samantabhadri.

Nevertheless his followers claim he duly entered full Nirvana:

After forty years as Spiritual Director of Rigpa, Sogyal Rinpoche stepped down following accusations of misconduct from former students. Sogyal Rinpoche passed into parinirvana in Thailand on 28 August 2019. He remained in the state of thukdam for three consecutive days.

This provides the closest correspondence with Vedic moksha and with entheogenic moksha for its enlightenment in natural existence:

The practice is to realise buddha nature, which has been present in our nature since the very beginning. The practice is simply to realise the radiance, the natural expression of wisdom, which is beyond all intellectual concepts. It is the true realisation of the Absolute Nature just as it is, the ultimate fruition. At the present moment our awareness is entangled within our mind, completely enveloped and obscured by mental activity. Through the practice of Trekchö, or 'cutting through all attachment', and the 'direct realization' of Tögal, one can unmask this awareness and let its radiance arise. To accomplish this it is necessary to do the practice of 'the four ways of leaving things in their natural simplicity' and through these, to acquire perfect stability in the Trekchö practice. Then will come the 'four visions of tögal' which are the natural arising of visions of discs and rays of light, deities and buddha fields. These visions are naturally ready to arise from within the central channel that joins the heart to the eyes. Such an arising from this channel will appear in a gradual process. In the same way that the waxing moon will increase from the first to the fifteenth of the month, these visions will gradually increase—from the simple perception of dots of light to the full array of the vast expanse of the sambhogakaya buddha fields. The manifestation of space and awareness will thus reach its culminating point. These experiences are not linked with consciousness or intellect as the former experiences were; they are a true manifestation or radiance of awareness. After this, in the same way that the moon decreases and disappears from the fifteenth to the thirtieth of the month, all of these experiences and visions, all phenomena, will gradually come to exhaustion and reabsorb themselves in the Absolute. At this time the deluded mind which conceives subject and object will disappear, and the primal wisdom, which is beyond intellect, will gradually expand. Eventually one will attain the perfect enlightenment of the Primordial Buddha, Samantabhadra, endowed with the six extraordinary features. This is the path intended for people of superior faculties who can achieve enlightenment in this very lifetime. For those of medium faculties, there is instruction on how to achieve liberation within the 'Bardo' or 'intermediate state'. When we say 'Bardo', in fact we recognise four bardos: the Bardo from conception to death; the Bardo of the moment of death; the Bardo of the Absolute Nature; and the Bardo of coming into the next existence.

Although claiming this is realisation of the Absolute Nature just as it is, this is a very complex demanding puja to fulfil and conjures up a vision of a very Buddhist reality, invoking the attainment of Nirvana. It is very different from an entheogenic vision because it is imposing a ritual visualisation defining the entire experience. It's really hard to say whether this claimed rebirth process is driven by Maya alone, or by the cosmic wheel of "karma", but the very prescriptive detail in the practice raises questions as to whether this description is genuine ultimate reality or just another Buddhist concept of purity, as illustrated in fig 195

Existence at the Edge of Chaos

*Truth is dynamic.
Permanence is illusion.
Emptiness is Maya.
Life is Enlightenment!*

My "haiku" is about the sacredness of life, in the shadow of [Hui Neng](#). The haiku is karmic. It's as much from our conversation as it is from me. I was confronted by your advancing Nāgārjuna's emptiness doctrine on the 26th and I had already quoted Hui Neng on the 24th, so the heat was on to turn the tables on the establishment. Jesus was a chaos messiah turning the tables on preconceived reality. To transform the paradigm you have to take the complementary route, even if it involves controversy. I stand by it because I have said it truly. It is turning Buddhist philosophy of Nāgārjuna inside out and is an intentional rejection of four key Buddhist doctrines in favour of life itself.

If we conceive of a sentient universe in which emptiness and renunciation, or God's will, are the road to enlightenment, we are violating a sacred principle. Life exists and flowers at the edge of chaos. Each of us is alive because ALL our ancestors saw fit to strive for the fulfilment of life across the passage of the generations for three and a half billion years, more than a quarter of the life of the universe. All animal species struggle to make a huge investment in rearing their offspring, even under severe adversity, starvation or predation, so that their inheritance of life can continue to flower. For humans to say this world is all an illusion and that an imaginary state of emptiness, or a jewelled eternal heaven spawned by an imaginary god is supreme is outright suicidal folly. Combining it with dominance over nature is a terminal death wish.

(1) Truth is dynamic: Truth is simply "good faith". There is absolutely nothing in the definition of truth to justify the claim that it is absolute and unchanging. All real truths arise contextually from their evolving circumstances. Static truths are tautologies.

truth (n.) Old English *triewð* (West Saxon), *treowð* (Mercian) "faith, faithfulness, fidelity, loyalty; veracity, quality of being true; pledge, covenant," from Proto-Germanic *treuwaz* "having or characterized by good faith," from PIE **drew-o-*, a suffixed form of the root **deru-* "be firm, solid, steadfast." Sense of "something that is true" is first recorded mid-14c. Meaning "accuracy, correctness" is from 1560s. English and most other IE languages do not have a primary verb for "speak the truth," as a contrast to lie (v.).

(2) Permanence is illusion: In the temporal physical universe nothing is permanent, because time is elapsing. Quantum theories all take place within space-time. Even in general relativity space-time is moulded by gravity. Biological life is continually evolving into new unconceived forms. The conscious universe is unfolding and flowering in ways we cannot anticipate. Consciousness is itself creative and innovative, never static. Moksha is itself dynamic – a transformational satori epiphany. To say there is no meaning of impermanence without permanence is incorrect. Permanence is a concept which does not actually exist.

Satcitananda (Sanskrit: सच्चिदानन्द) is an epithet and description for the subjective experience of the ultimate unchanging reality, called Brahman. It represents "existence, consciousness, and bliss" (Raju 2013 228), *The Philosophical Traditions of India*, Routledge, p. 228) or "truth, consciousness, bliss". (Murty 2002 303).

Let's pivot on this because here is the nub of permanence: (1) Is ultimate reality permanent? (2) Is existence truth? I suspect both of these are undecidable, and Symbiotic Existential Cosmology treats ultimate reality as emergent.

(3) Emptiness is Maya: Emptiness does not exist. It is a concept that is not viable. Even the quantum vacuum is seething with every conceivable particle out of the big bang coming into and going out of existence. Consciousness is never empty or we call it unconscious. What use is unconscious moksha? Emptiness only has relative meaning to that which contains it. Otherwise it is void – non-existent, but that also means empty, so is itself relative.

void (adj.) c. 1300, "unoccupied, vacant," from Anglo-French and Old French *voide, viude* "empty, vast, wide, hollow, waste, uncultivated, fallow," as a noun, "opening, hole; loss," from Latin *vacivos* "unoccupied, vacant," related to *vacare* "be empty," from PIE **wak-*, extended form of root **eue-* "to leave, abandon, give out."

Therefore the entire notion of emptiness is an illusion. Maya is real, diverse, transformative flowering and unfolding. She is Shakti unleashed. To forsake the real for an imaginary realm of emptiness is a tragic error, denying life as it exists in favour of a fantasy. In fact it is the biggest most addictive deception of all – grasping for that which cannot be grasped, but only submitted to.

(4) Life is enlightenment: This is the ultimate remedy to the mortal coil. We can't take the things we grasp for with us, so regenerative compassion for immortal life as a whole is the only viable remedy. To imagine that enlightenment takes many lifetimes in a fictitious round of reincarnation where genetic realities are ignored and two-toed sloths and become crocodiles or humans is gross and foolish. So is the conflagration of life in the Revelation.

You suggested it was qualified by "conventional mind-dependent reality (cMDR)". This is NOT the case and I will explain why. I said: "I AM original source, transient in the dance of Maya, as Shankar courting Shakti. My transient mortality IS the dance of unfolding of life immortal". You responded with: "Yes, at cosmic level, "I" at dual-aspect moksha state ~ dual-aspect Brahman ~ dual-aspect Shiva-Shakti, there is no individual self because it is merged with the original source dual-aspect substrate after moksha/liberation". This is not the case! It is not dual aspect at all. This is a fantasy of cosmological housekeeping in the face of the dynamic truth of conscious life immortal.

When I made the above statement, it was not metaphorical, or philosophical, but a direct experiential affirmation in the first person. I'll try to explain this. Primal subjectivity is the germ, but it is seamlessly compliant with the physical boundary conditions, so in everyday perceptual life, it is compliant only with organismic ego consciousness modulated by natural compassion, but when one meditates deeply while on entheogens, one undergoes a transformation into a non-ordinary reality that takes the form of a trip, where the doors of perception are flung open and experience can become asymptotic to a form closer to cosmic consciousness not bound by the organism. This changes one's persona, like travelling to a foreign country, and carnal knowledge and opens the mind to ultimate reality. Afterwards things are changed and the germ of primal subjectivity now resonates with a new existential condition that never fully goes away. So I am perfectly sane and my mind remains lethally sharp, but ultimate reality travels with me everywhere I go. If I stepped back from this to concede any previous doctrine at face value, it would be hearsay abandoning the covenant. Thus when Buddha became enlightened, an irreversible transformation occurred, in which knowing or gnosis changed the nature of reality for him and ultimately for us.

In what you call cMDR, the germinal subjectivity has organismic boundary conditions that prevent it from seamlessly merging with enlightenment, but after moksha, the perspective changes, so we can still be organismically egotistical, obdurate even, but underneath, the germinal subjectivity has made contact with the totality beyond and is now

unleashed in the way we think of apocalypse as the complete “unveiling” of Maya into enlightenment. One can't really go back from this. Ramakrishna could barely sit down at Dakshineswa.

You are attempting to quote Buddhist philosophy to qualify and limit a direct visionary account. When the Brihadaranyaka says “I am He” it is a statement in the first person of ultimate reality within. It is NOT dual-aspect. In the same way, Moses gazing on the vision of the burning bush said his apotheosis was simply “I-Am”. This is germinal subjectivity immediately becoming aware of our cosmic consciousness no longer veiled by cMDR. In the same way Paul of Tarsus said “For now we see through a glass, darkly, but then face to face: now I know in part; but then shall I know even as also I am known.” Although I reject Paul’s teaching, his vision of the naked transparency and immediacy of cosmic consciousness “face to face” is telling and accurate.

Alex Hankey: Ram, Nagarjuna caused endless difficulties in endless ways, because he aimed to totally differentiate Buddhism from Vedic culture. But Buddha learned all his spiritual concepts at the feet of a Vedic Guru, and used Ayurveda when medicine was needed - the famous Jivaka was his Vaidya. Buddhism as taught by Siddhartha Gautama has to contain a concept equivalent to Ahankara - there is no choice. Of course, The Eightfold Path may have carried His Disciples quicker along the Moksha Marga than those of His Contemporary Gurus. BUT what he learned in Bodha Gaya was pure Vedic Wisdom, Nitya Gyana.

Ram: In my view, Buddhism was designed for reducing sufferings in our mundane lives. So that we can have happier living in current life. For this purpose, Buddha proposed 4 noble truths and 8 noble path with 12 links that cause suffering. If we are able to break the chain of 12 links thru 8 noble paths, sufferings will be reduced.

mundane (adj.) mid-15c., *mondeine*, “of this world, worldly, terrestrial,” from Old French *mondain* “of this world, worldly, earthly, secular;” also “pure, clean; noble, generous” (12c.) and directly from Late Latin *mundanus* “belonging to the world” (as distinct from the Church), in classical Latin “a citizen of the world, cosmopolite,” from *mundus* “universe, world,” which is identical to *mundus* “clean, elegant,” but the exact connection is uncertain and the etymology is unknown. The English word's extended sense of “dull, uninteresting” is attested by 1850.

Chris: We don't need any of this. Mundane lives are not boring, they are “of the universe”, so Buddhist enlightenment is escaping the universe into a fictitious heavenly emptiness, as the Buddhist wheel of life, fig 213 implies. If we are honest with ourselves, we are mortal human organisms and all of us will die. Therefore we can only gain meaning by giving back our life's work to the benefit of life as a whole. There is simply no need to repress, negate or philosophically deprecate the ego, which is a protective feature of consciousness to aid survival. Religions with hungering for eternal life or reincarnation and rebirth make this difficult or impossible to achieve because they create unrealisable longing.

Of the three religions that embraced the notion of reincarnation, Vedanta, Jains and Buddhists, we have the following: In Hindu philosophy, moksha is the union of or the realisation of the identity of Atman with Brahman, depending on the Hindu tradition. In Jainism, nirvana is also the soteriological goal, representing the release of a soul from karmic bondage and samsara. In the Buddhist context, nirvana refers to realisation of non-self and emptiness, marking the end of rebirth by stilling the fires that keep the process of rebirth going.

Jains deal with karma as eternal conscious souls. Enlightenment doesn't mean exit from the round of birth and death into sheer emptiness defeating the meaning of life itself. According to Jainism, the existence of “a bound and ever changing soul” is a self-evident truth, an axiom which does not need to be proven. Bad karma has negative effects but good karma is transformative. The perfect enlightened souls with a body are called *Arihants* (victors). Only a soul with human body can attain enlightenment and liberation. The liberated beings are the supreme beings and are worshipped by all heavenly, earthly and hellish beings who aspire to attain liberation themselves.

Vedanta is the “royal route”, which, as we know, accepts the reality of the self and the ability of the individual to achieve moksha in which the self or atman can achieve unity with ultimate reality Brahman also conceived in the persona of the godhead Īśvara / Īśvarī, so Vedanta allows a continuity between atheistic reality and polytheism. Some Indian traditions have emphasised liberation on concrete, ethical action within the world. This liberation is an epistemological transformation that permits one to see the truth and reality behind the fog of ignorance. Because moksha is attaining unity with Brahman, enlightenment is a constructive fulfilment. Moksha has been defined not merely as absence of suffering and release from bondage to saṃsāra. Various schools of Hinduism also explain the

concept as presence of the state of *paripurna-brahmanubhava* (the experience of oneness with Brahman, the One Supreme Self), a state of knowledge, peace and bliss.

Buddhism short circuits the spiritual complexity by advancing an atheistic psychological philosophy, in which rebirth is driven by the grasping ego and release lies in pure emptiness ending the reincarnation cycle. Theism is denied, as there is no deity, and the self is denied in favour of emptiness. Nirvana (nibbana) literally means "blowing out" or "quenching". It is the most used as well as the earliest term to describe the soteriological goal in Buddhism: release from the cycle of rebirth (saṃsāra). Nirvana is part of the Third Truth on "cessation of dukkha" in the Four Noble Truths doctrine of Buddhism. It is the goal of the Noble Eightfold Path. The Buddha is believed in the Buddhist scholastic tradition to have realised two types of nirvana, one at enlightenment, and another at his death. In the Buddhist tradition, nirvana is described as the extinguishing of the fires that cause rebirths and associated suffering. The Buddhist texts identify these "three fires" or "three poisons" as *raga* (greed, sensuality), *dvesha* (aversion, hate) and *avidyā* or *moha* (ignorance, delusion). The state of nirvana is also described in Buddhism as cessation of all afflictions, cessation of all actions, cessation of rebirths and suffering that are a consequence of afflictions and actions.

One also needs to note that interdependent co-arising is not an original idea. Centuries before Buddhism, the second main principle of Jainism is *anekāntavāda*, the doctrine of many-sidedness from *anekānta* ("many-sidedness") and *vada* ("doctrine"). The doctrine states that truth and reality are complex and always have multiple aspects.

Jainism also enunciated Taoism's central tenet "The way that can be told is not the countless way": Stating that reality can be experienced, but cannot be fully expressed with language. It suggests that human attempts to communicate are Naya, "partial expression of the truth".

So, in summary, Buddhism is NOT the antidote to dukkha. The doctrine of reincarnation is NOT a fact of life either, but of the three traditions, Jainism preserves the sanctity of the soul as a voyager through eternal time, Vedanta preserves the sacredness of the self, which in moksha can become one with ultimate eternal reality in Brahman which is also identifiable in theistic personae as the godhead, but Buddhism offers only practical psychological advice, in which nirvana is emptiness and is achieved only by escape from the entire life process.

Of the three, Jainism and Vedanta retain cosmic forms of spirituality but Buddhism denies it, dealing only with suppressing the negative aspects of the ego. By contrast, Symbiotic Existential Cosmology rejects both reincarnation and creation cosmologies and makes conscious life itself the sacred process, accepting both consciously spiritual and physical existence, realised in visionary experience and the Vedic principle of moksha, in which the individual self or soul achieves union with cosmic reality, invested in the passage of the generations of life rather than immortal individual souls or an omnipotent godhead.

Ram: When egg and sperm interact, initially there is no sex; sex appears, later on, depending on hormones and chromosomes; if testosterone is dominant and X-Y chromosome then male, otherwise female; both are the same species, human.

Chris: This is biologically incorrect. The sperm either has an X or a Y, so fertilisation is male determining sexual, with the eggs all single X. If the sperm has an X we get an XX girl otherwise an XY boy. Sex is not determined by testosterone, but by the SRY gene on the Y chromosome. So saying there is no sex at fertilisation is false. Furthermore fertilisation, ever since the metazoa emerged, has been sexually symmetry-broken between a large enveloping egg and small particulate sperm, because the original isogametes caused mitochondrial genetic warfare that destroyed 90% of the photosynthetic plastids of the fertilised embryo. This leads to manifest polarities in reproductive strategy between men and women, who, like all mammals give an often difficult birth to live young.

Ram: Both [men and women] are the same species, human. In this sense, both are equivalent; in work/job also they are equivalent; they have equal rights.

Chris: The sexes are NOT equivalent. The women bear the brunt of the vast majority of parenting in mammals and in humans too. Male mammals reproduce by spreading wild oats and females delivering live young do it by parenting. For you to claim there are no intrinsic differences is an unscientific defence of Buddhism. No they clearly don't have equivalent rights socially or religiously. Women are subjected to rape, chaperoning, bride burning, stoning for adultery while the men are often just whipped, female genital mutilation, , killing the girl child in favour of boys, forced to wear

the veil. In Iran today a news item reports school girls are being poisoned with organophosphate herbicides as punishment for the hijab protests in which hundreds have been killed and girls and women sexually abused.

If stopping the internal dialogue, as [Carlos Castaneda](#) (1968) also said, is central to enlightenment, so is stopping the doctrine of 8 spokes ⁹⁶ and letting the wheel of karma be naturally out of balance enough for life to enter into the equation.

In a sense, the three reincarnation traditions Jains, Vedantists and Buddhists did one kind and astute favour to life by recognising all animals as conscious. Darwin did the same for all life from the polyps up, having free will, although it is scarcely recognised by neural network neuroscientists and physicalist biologists.

The telling tale is what each tradition actually did with the question of life itself and that's the bane of going beyond good advice about "mundane existence" into the centre of the cyclone of reality. Jains treat all conscious beings as eternal souls on an endless journey of discovery, so life remains sacred. Vedantists do the same collectively in Brahman as the ultimate reality realised in moksha that "powers" life itself. But Buddha, in denying the reality of ultimate reality brought the living universe into a state of Maya, in which the crowning goal is to exit life as the realm of mundane illusion.

I believe we all, and particularly Buddhists need to recognise the fallacy in this. All the great scientific paradigm changes were founded by creative geniuses who also made mistakes. Newton, who more than any other is associated with the mechanistic universe, spent his days trying to predict the exact time of the second coming. The same with all our existing religious traditions. Jesus was flawed for allowing a brilliant set of gnostic insights which bridged the extant traditions to result in his crucifixion and the ensuing two millennia of violence. Muhammad likewise has a history of genocide of the Jews of Medina. Buddha can be forgiven for his very elegant practical psychological advice in the face of the more extreme Polytheistic excesses of Hinduism, but of the three traditions, despite the sudden awakening of satori in a cherry blossom, Buddhism has committed the birth of new life to the round of suffering unfairly.

The first step of redemption is allowing Buddha to have made an error of cosmology and to accept it qualifies the tradition, by admitting the overflowing joie de vivre of life as the very core of existence, not Maya, or at least if you like accepting Maya, as the Shakti that all Buddhist tantras of Yab-yum point to.

Hence my reply to Ram that human fertilisation IS also sexual and the twain cannot be so extricated into androgynous neutrality.

*True knowledge is that which flowers the diversity of life in conscious climax.
One experiences moksha, but that's just the inspiration, not the redemption.
The dharma and sadhana are to life itself.*

Ram: The **Vedic-Moksha** (VM) in non-interactive dualism-based Sankhya is the disconnection of jivatman [self-as-subject (SaS), passive invariant self (PIS), part of Individual Purusha] from all three bodies (sthula/gross-physical, sukshma/subtle/astral, and karan/subtler/causal). In other words, after our physical death, astral death, and causal death i.e., after the nullification of karma, the jivatman becomes totally free from Prakriti, then jivatman becomes atman (which then merges with cosmic Purusha/Brahman) after attaining moksha state. In the moksha state, jivatman becomes atman, which is called the transcendence of jivatman to atman (pure consciousness). Subjectively, yogis/mystics experience unity (subject-object unification) at nirvikalpa samadhi with 100% disconnect from physical brain-body.

The psychedelic-herb-Moksha (PHM), in SEC/ICAM (interactive complementary aspect monism), is the subjective experience (SE) of unity after ingestion of psychedelic herbs such as psychedelic-herb mushrooms.

Chris: Moksha is a major term spanning cultures which has to do with transcendent revelation which frees subjective consciousness from entrapment in the round of birth and death.

⁹⁶ Right View, Right Resolve, Right Speech, Right Action, Right Livelihood, Right Effort, Right Mindfulness, and Right Concentration.

Moksha (Sanskrit: मोक्ष, mokṣa), also called vimoksha, vimukti and mukti, is a term in Hinduism, Buddhism, Jainism and Sikhism for various forms of emancipation, enlightenment, liberation, and release. In its soteriological and eschatological senses, it refers to freedom from saṃsāra, the cycle of death and rebirth. In its epistemological and psychological senses, moksha is freedom from ignorance: self-realization, self-actualization and self-knowledge.

Soteriology denotes beliefs and doctrines concerning salvation in any specific religion, as well as the study of the subject. The idea of saving or delivering from some dire situation logically implies that humankind, as a whole or in part, is in such a situation.

Eschatology is the part of theology concerned with the end of days – death, judgement, and the final destiny of the soul and of humankind.

Epistemology is the theory of knowledge, especially with regard to its methods, validity, and scope, and the distinction between justified belief and opinion.

Psychology: Psychology ex 1650s, "the study of the soul," from Modern Latin psychologia, from Latinized form of Greek psychē "breath, spirit, soul"+ logia "study of". In modern use: (1) The scientific study of the human mind and its functions, especially those affecting behaviour in a given context. (2) The mental characteristics or attitude of a person or group.

Symbiotic Existential Cosmology is pivotal on all of these. It is not just for individual enlightenment but **has a remedy for world salvation**, it deals centrally with **the end of days and avoiding a Fermi extinction** and it carefully distinguishes legitimate knowledge from religious spiritual or materialistic beliefs and opinions. It is also **psychologically transformative**.

Moksha has a broad understandable meaning in terms of the meaning of life itself, which could be interpreted in various ways:

- (1) That moksha attains Buddhahood thus freeing the Buddha from the round of reincarnation, but then we have only emptiness as the outcome, so what does Buddha then do?
- (2) That moksha attains unity between atman and Brahman and becomes unified with the cosmic consciousness of Brahman. Then what does he do with it now?
- (3) That moksha attains unity with the diversity of life, enabling the subject to become freed from the existential paradox of mortality in unity with life immortal. He then commits to Brahman's advice in a covenant to reflower life immortal in the unfolding conscious universe.

You have effectively devalued psychedelic moksha as merely "the subjective experience (SE) of unity after ingestion of psychedelic herbs such as psychedelic-herb mushrooms" when the experience was specifically a meeting with, and merging with, Brahman as cosmic consciousness, which also addressed in specific detail the actual remedy to the round of birth and death, in realising humanity's relationship with life immortally evolving, rather than humanity precipitating a Fermi crisis of survival. This is a scientific and religious revolution towards immortality in the mortal coil.

At the opposite extreme you have described Vedic-moksha as an extremely metaphysically detailed series of "disconnections" of self as subject from all three of physical, astral and causal. I think this is an unreal claim even if it is Vedic and simply highlights the error of running away with spiritual descriptions which have no real meaning in terms of subjective experience at all. Your description of the Vedic moksha turns this all on its head, slicing through the cosmos with multiple disconnections of reality, which have no connection with life or real existence.

Siegfried Bleher: Sutra II.12 in Patanjali's Yoga Sutra designates the klesas ('causes of affliction' which are five in number—different lists in other texts—the most significant of which is not recognizing one's true nature; ego; attachment; aversion, clinging to life) as the root of the action deposit, the fruition of which may be seen in this lifetime or another. In other words, it is not even the action itself that creates a subliminal trait that eventually ripens to impel further action, but rather the presence of a cause of affliction during an action that leads to storage of a subliminal impulse: action in the absence of any of the causes of affliction leaves no deposit.

And this text is referring purely to reinforcing/weakening and rearing of impulses in individuals; it does not refer to 'return of actions'—we always have the choice whether to act on such an impulse or not; nor does it account for experiences we all get caught up in that are influenced or caused by others—our part in such moments may only be in how we respond to our circumstances; and that is what the law of karma primarily deals with (as I understand this text). The only part of the law of karma that seems to make it into broader awareness focuses on actions, but this text, at least, refers to actions as secondary in importance to their roots—the impulses and habits we typically act on (samskaras and vasanas).

Chris: I like Patanjali, for his respect for the herbs, but this is too much baggage to take on. To accept your account of Patanjali at face value, we end up with a huge raft of reincarnation doctrine to support it, for which there is no convincing evidence that would remotely hold up in a court of law, let alone in true honesty to our own redemption and illumination. The baggage itself is in biological and cosmological error. This simply isn't the way the universe rises to living conscious climax. It's the progenitor of the Kali Yuga and the Samvartakalpa i.e. cosmologically degenerate.

None of us know, when we walk to the supermarket whether we will get hit by a car crossing the road. None of us know what symptoms are suddenly going to appear at the age of 78. My brother just found he has stage four cancer. Life is rough justice many of us meet misfortune no past life has engendered. Life HAS to be this way for diversity to exist. We have a fleeting time in this life to reach moksha. If we can't move beyond these notions we will get nowhere. Karma is not moral, it's the way uncertainty manifests in the universe, then mystified by Eastern religions. Natural sin does not exist. It's the way things have to be for life to rise to climax diversity, plants and animals, carnivores and herbivores, parasites and prey and so for conscious sentient beings to emerge. Fire and flood are features of nature. Environmental uncertainty arises ultimately from quantum uncertainty. Neither is uncertainty random, but is a law unto itself in the quantum entanglement, that appears ergodic.

I take particular exception to the use of "clinging to life" as bad karma. Life is sine qua non the key to existence. Any philosophy which deprecates reverence for life as a disposable delusion is a tragic cosmology. In the Western tradition, scientifically minded people can assess the Sabbatical Creation of Genesis as merely quaint allegory, which forms the Earth and plants before the solar system and the birds before the land creatures. We don't have to take it literally. The same has to go for Eastern mystification doctrines.

We need to treat life with due respect and not, in the third millennium, go on treating reincarnation and moral karma, as valid and true, whether by act or by affliction. The entire concept of renunciation of life is abhorrent to the survival of life. We shouldn't be espousing notions that we know are inconsistent with reality and with the ability and striving of life to survive immortal against the odds. I know and accept I am a mortal human being in the centre of the cyclone of reality because any etherial realm is a fantasy, as is the quest for eternal life. Brahman told me this and it is utterly true. The mortal compassionate love of life is the antidote to clinging and craving, not renunciation of desires. Desire for life is the most altruistic thing we can know and do. It begets genuine immortality not fake eternity, and it transcends any other type of action and heals all affliction.

Ram: What is a Fermi crisis of survival? Please elaborate on it.

Chris: The Fermi paradox is why can't we see no life elsewhere in the universe when it seems extremely probable given the astronomical number of galaxies stars and planets in the universe? A Fermi paradox self-extinction by human exploitative misadventure of the planetary biosphere is an example of the idea that intelligent societies are unstable and prone to self-destruct. The Western religious tradition revolves around apocalyptic crisis in the end of days. Rather than a complete destruction, Symbiotic Existential Cosmology is the remedy that alleviates destructive apocalypse by reflowering the tree of life.

Ram: The major problem is this: is the self a process or an entity? Does it survive death?

Chris: The self is both a process and entity in complementary relationship. The default network and the limbic system are evolved characteristics to ensure the process of self-consciousness retains functional stability for the survival of the organism unless external behavioural or biochemical processes intervene, including meditation, sensory deprivation and psychedelic states. Yes they are processes, in this sense but they are also entities which give us our sense of identity as "I", although they are consciously generated as "stable evolved hallucinations".

The intrinsic difficulty with all philosophical frameworks is not that they are difficult to understand, but the processes arrived at are neither empirical nor natural but part of logical discourse that leads to disjunctive contradictions like your use of process versus entity. They are brittle, conjectural, hypothetical and lack empirical validity.

Hard physical materialists contend that all 1pp experiences and reports are invalid because they only accept one form of empiricism involving statistically reported observations, involving high sigma 3pp experiments, but the principle of empiricism is correct to both 1pp experienced and 3pp observed investigations. Philosophical systems are deficient, through deprecating the principle of empiricism – the ultimate reality check of nature. This is spelt out by the contrast

between Symbiotic Existential Cosmology, which is an empirical cosmology and IDAM which is a philosophical framework.

I reject pure physicalist schemas, as self-fulfilling beliefs of their own. Hard core physicalism is a belief, based on promissory materialism on the assumption that solving easy mechanistic problems can proceed to unveil the ultimate mysteries because optimism from scientific and technological advances has created a bootstrap belief in the inevitability of exhaustive scientific discovery. This is a fallacy manifest in the ever diminishing proportion of groundbreaking scientific discoveries to exponentially increasing meticulous run-of-the-mill additions to known areas (Park, Leahey & Funk 2022) fig 70b. By contrast, groundbreaking insights are becoming monotonically rarer.

But we are dealing with the ultimate challenge to science. Subjective consciousness vs the physical brain and universe is the cosmological Mariana Trench of the discovery process and attempting to apply it the way pure materialists do is doomed to failure because the problems of affirming the hypothesis of causal closure of the physical universe is uncomputable, and undecidable and the hard problem of subjectivity is physically inescapable.

Ram: You wrote "The self is both a process and entity in complementary relationship." Please elaborate further. By self as entity, I meant eternal atman, which survives death. But brain processes die after brain death.

Chris: The self is a dynamical process stabilised by evolution as a key strategic component of the way an organism relates to the world. Emotions and the limbic system play a key role because they are feelings we experience that are strategically placed to result in characteristic defensive, aggressive and responsive modes, from fear and anger through remorse, disgust, hatred and contempt to amity, affection and love. These are all directed from the "self" to the "world" maintaining our self-polarisation. We recognise these modes in others and call it egotism, but frequently remain oblivious to them in ourselves. But these can become decoupled, so that self and other dissolve and oceanic states of meditation, contemplation, samadhi bliss can occur, through at the other extreme to complete alienation and depersonalisation – heaven and hell in purgatory!.

So the self is an elusive constellation of moody states that orient the complementation between our ongoing sense of identity and the vagaries and opportunities of the wild world around us. They are hallucinations in the sense that all conscious experiences are not just simulations but veridical representations in their own right of existence, without which the experiential universe cannot exist. Even the most hard core physicalists cannot seriously deny subjective conscious experience is the only reality they know, despite their obsession with 3pp five sigma stats.

No one knows and has ever known whether the atman is eternal. It's a wishful notion that is not well formulated. Time itself is an illusion. Not only is something eternal unchanging but it is constitutionally incapable of change. The only recourse a photon has for its status once created, is absorbing annihilation, so why would you seek eternal life?

What we do know about the atman-Brahman is that the near death experience is commonly perceived as a telepathic identity between our organismic self and an abstract archetypal cosmic self which seems to be forever, just as our consciousness is not our own possession, but flows through us in the eternal present, or more precisely the quantum of the present, although we know it goes somewhere else every night we sleep and got wrapped up in the arms of Morpheus like blue and orange paints stirred in a pot until they just become a forgetful greyness, until we wake, thinking we were in Egypt walking by a temple on the Nile.

Vinod Sehgal: In your SEC, subjective and physical are complementary and interacting but in Ram's IDAM, these subjective/ non physical and physical aspects are co- existing, co- arising and non interacting. Ram's view has been that interaction between subjective/ non physical and physical aspects is a category mistake.

Chris: It can't be, because the three of us all know we have active subjective conscious volition over the physical universe every time we exchange emails. Locking the *s* aspect to the *p* aspect as a fixed duality is in contradiction to our empirical experience unless you assume the *p* processes are driving the boat and then we have mind-brain identity materialism. Interaction is not a category error. We ARE interacting with the world. We clearly aren't in a dual parallel *s* and *p* process. Duality forces homology, contradicting the completely different way subjective and objective manifestations appear. Ryle came up with the category error idea with Descartes because he claimed including mind and world statements in the same category was a "category error". But mind is *s* category even for Descartes and physical is *p* category, so Ryle's notion is ill-posed.

A unified Cosmos can't be a complete duality, so a cosmology can't be fully dualist, therefore two aspect monism is correct. However it can also either be dual or complementary in its aspects. Interactive complementarity provides the high degree of asymmetry we experience between a very mechanistically separable universe and a very wholistic experiential realm.

Vinod: We become unaware of our physical bodies but our astral bodies very much continue to exist and remain active. It is the astral body which flies over physical body. And it is our self/consciousness which sees our astral body to fly over our physical body (though we are not aware of our physical body). Had there been no astral body as composed of some non physical substrate and not flying, how could you see any body flying in the dream state?

Chris: Here's an example of mine showing how non-ordinary reality can be as big as the universe and the way back is NOT through space, or levels of existence, but slipping in and out of the body:

While dreaming, I looked at my hands and I became lucid and a huge gust of sea breeze with salt spray doused my light Indian shirt. I could feel every droplet hit my skin. The day was radiant shimmering with intense sunlight. I stared at the azure sky, desperately trying to find my way back to Earth, knowing I was in another universe. I rushed up to a woman with dark eyes and stared deeply into hers silently saying "where is the way back?" And she just smiled and shook her head. At the same time, I realised I was shooting up ever faster like a rocket. But again at the same time, another I realised it was all okay, because I was just bobbing on the ceiling of the bedroom looking down at my body sleeping below.

You have no basis whatever to claim ethereal astral plane substrates for any of these. They are projectively manifested experiences with few or no bounds on what is possible or how they occur. They may even anticipate future realities we yet have to face. The only way we can find out is to actually make the journey ourselves.

Ram: Yes, subjective experiences (SEs) and their respective NPB/NCC (neural physical basis / neural correlate of consciousness) exists. But the content of endogenously generated SEs may not exist. For example, if you dream of a flying woman by herself, then yes such SE and its NPB exist but there is NOT a flying woman that everybody can see similar to flying birds in our real physical world.

Chris: The very non-ordinary content of dreaming shows it transcends the restrictions on waking perception, so the pursuit of knowledge requires us to address how this can take place. These discussions just keep coming back to the hard problem extrapolated into the **hard manifestation problem** "how do conscious experiences manifest themselves to us"? And what are the implications of the fact that they can transcend real world experiences?

One can think about it neuroscientifically, in that higher sensory processing areas in the parietal and temporal lobes can arrive at resonances different from and inconsistent with perceptual excitations driven from the primary sensory areas, but that doesn't solve the manifestation problem as it is more than just an evoked binding problem. Nothing objective can even be conceived to subjectively manifest experience in and of itself. You can take that even further with psychedelics, involving changes to our entire understanding of what a conscious experience is and can be.

Astral worlds fail to explain non-ordinary experiential reality because conscious awareness transcends any substrate driven model, just as non-ordinary states transcend sensory experience of the physical world, which is why I termed it projective of consciousness. That's why astral worlds are defective and degenerate and why I am very sceptical of yogi's reports about both astral worlds and samadhi experiences as a kind of wishful thinking.

Symbiotic Existential Cosmology is trying to teach people to actually be courageous and use the tools they have, dreaming, meditation and particularly entheogens to find out what the hell is going on.

Vinod: I agree with Chris that conscious experience and build up of NPBs are not simultaneous since there should definitely be some time gap, however minuscule the same may be, between the two and hence they are also NOT inseparable. They are also not complementary like a particle and wave since they don't come from the same substrate. Had they been coming from the same substrate, there are no reasons as to why conscious experiences can't be detected/ scanned thru 3pp physical instrumentation or thru 3pp shared subjective experiences. They are, in fact, sequential with both originating out and existing at different substrates- NPB from/ at physical substrate as forming brain and conscious experiences from/ at non physical (\ astral) substrate as forming mind.

Coalescence: Saving the Diversity of life from Fermi Extinction is the Meaning in Existence.

Joshua Davis: Without Metaphysics, Ethics and Spiritual Maturity, scientific knowledge is at best incomplete and at worst dangerous and destructive.

Kashyap Vasavada: I have to agree with part of your statement. Mankind has to learn to instil ethics and spiritual maturity into itself otherwise it will destroy itself for sure. However, I have to say also that religion and metaphysics are at least 2 to 4-5 thousand years old, much older than science. ... But currently existing religions and metaphysics cannot instil ethics and spirituality. So far mutually assured destruction has prevented nuclear wars. But how long it will hold, no one knows.

John: According to Garrett Hardin (1968), author of "The Tragedy of the Commons" there is no technical solution. So where does that leave us?

Chris: Existing religious traditions are inadequate to address the problem, not least because their religious innovators lived in a time when the Earth's dwindling resources and habitats and burgeoning population were not an immediate threat to human survival and the survival of the biosphere itself. Hence the preoccupation with cultural crises in the Bhagavad Gita and apocalypse and Armageddon in Revelation. This has in turn led to false spiritualities that neglect the sanctity of life as a whole in favour of fictitious realms and vain desires.

But the problem can't be solved by science either because life has no existential meaning in and of itself physically. And as Joshua comments, the same science can be used to heal or to exploit. It has no moral value in and of itself. But moral values are no use either because, as Richard Alexander author of "The Biology of Morality" realised, in staring down the barrel of mutually assured nuclear destruction, morality is not absolute, or an absolute good: It is just an evolutionary process to reduce intra-social competition to ensure inter-social dominance.

So we come back to prioritising existence by the key existential threats to survival – biospheric mass extinction, climate and habitat crisis and nuclear holocaust. Currently these are the last options people think they have time to consider. So the last must come first as Jesus said and the rest will sort themselves out over time, because life is saved.

There is one and only one solution to this. Life needs to be recognised as sacred, in our hearts, our minds and our very souls for want of a better word. We need to raise high the roof beam of life itself as the flowering pinnacle of our fulfilment over all notions and illusions of spiritual, scientific or technological redemption. We can no longer treat life as a lesser, inferior, dumb, or flawed entity to be dominated by human intelligence.

No political, economic, scientific or religious work-around will suffice. Unless we become fully symbiotic with the immortal flow of life, humanity and the biosphere will suffer atrophy and eventual extinction, either with a bang or a whimper.

John: You advocate for such religious faith in regard to a combative strategy for preserving life as it exists materially but deny faith in a holistic strategy that would preserve its spiritual integrity first. This is the very dilemma that produces the problem - placing the cart before the horse. The existential symbiosis of your theory is an outcome of deeper holistic consciousness. SEC seems to conflate these levels or reverse their natural order.

Chris: It's not confrontational to save the diversity of life from extinction John. Edge-of-chaos cosmology, as compared to the ascendance of spirituality is NOT "combative". Spiritual integrity can have no meaning in the absence of life. Active redemption of life provides for dissent when faced with obstructive resistance, as democracy does, and promotes paradigm change. Apocalypse doesn't need to be combative but it has to have its claws if the future of life is as threatened as it is. If SEC is valid cosmology and the supremacy of spiritual holism is a delusion, we need to be honest and transparent about it. Occam's razor gravitates to removing the clutter of a priori claims. It is intended to reduce mystification and false assumptions.

John: This is the very dilemma that produces the problem – placing the cart before the horse. The existential symbiosis of your theory is an outcome of deeper holistic consciousness. SEC seems to conflate these levels or reverse their natural order.

Chris: Symbiotic Existential Cosmology is NOT an outcome of holistic consciousness but it's the valid empirical cosmology of conscious life. Life precedes spiritual holism in the evolutionary process. It didn't arise from holistic consciousness devoid of nature but from interaction with the biospheric sacraments. There is no established deeper holistic consciousness involved in its genesis other than my meeting with Brahman that revealed the cosmology, which must needs be respected on its own terms as Brahman informing me of the central meaning and importance of protecting the diversity of life. Yours is in no way a valid claim for someone who hasn't made that journey themselves to intentionally put the cart of spirituality back before the horse of life to justify their religious predilections in effective contempt of the source experience! You are incorrectly trying to reassert the tower of elite spiritual states over and above nature and direct empiricism by affirmed subjective experience and verified objective observation.

Chris: I like the idea of free will as a transcendent. I don't accept certainty, or faith as in this category.

John: Free will has to be free to do something, which is to decide something independently from other determinants. Thus we are free to be certain and have faith. You are also free to not have such faith. That's what free will means. Then live and see how it works out for you, but **do not require it of others.**

Chris: You are incorrectly attributing me to **requiring** lack of faith. Saying an assumption is not true is not "requiring" it to be untrue. It's the assumption itself that is invalid, so truth requires honesty. We are not free to be certain and have faith, or not as the case may be. We are living biological organisms with spiritual pretensions, in a universe with realities and empirical truths. Free will means: *the power of acting without the constraint of necessity or fate; the ability to act at one's own discretion* (Oxford Languages). It doesn't mean the arbitrary freedom to believe misinformation that has consequences for others. You may have spiritual pretensions but decisions have consequences, so if you entertain a false world view, particularly a religious one that is actually inconsistent with how the Cosmos as a whole (subjective and objective) manifests and continue to believe this and act upon it, it has consequences for the future of life.

In particular there is a difference between requiring faith, which is what morally prescriptive religions do and what a cosmology does which is to show us how it actually IS transparently, so we can decide more accurately that our assumptions may be at variance with reality and harmful to our's and life's futures. I may protest and be a voice crying in the wilderness but I am clear as pure water that there is no moral imperative here.

I want to make clear what faith actually arises from. Faith as a concept arises from trust. Verifiable trust is the foundation of gatherer-hunter long-term judgment of good character. It has later been extrapolated to faith in the spiritual divine, which is NOT verifiable.

faith (n.) mid-13c., *faith, feith, fei, fai* "faithfulness to a trust or promise; loyalty to a person; honesty, truthfulness," from Anglo-French and Old French *feid, foi* "faith, belief, trust, confidence; pledge" (11c.), from Latin *fides* "trust, faith, confidence, reliance, credence, belief," from root of *fidere* "to trust," from PIE root **bheidh-* "to trust, confide, persuade." From early 14c. as "assent of the mind to the truth of a statement for which there is incomplete evidence," especially "belief in religious matters" (matched with hope and charity). Since mid-14c. in reference to the Christian church or religion; from late 14c. in reference to any religious persuasion. From late 14c. as "confidence in a person or thing with reference to truthfulness or reliability," also "fidelity of one spouse to another." Also in Middle English "a sworn oath," hence its frequent use in Middle English oaths and asseverations.

In Christianity we have faith, hope and charity – later termed love, but faith is prone to "obsession" as both Augustine and Gregory state. The necessity of faith in Jesus is Christianity's short-circuit to eternal life. The fact that Augustine, the founder of the incorrect notion of original sin, said this of faith is a signal warning! Are you sure you want to espouse this against the empirical truth of the Cosmos itself?

charity (n.) late Old English, "benevolence for the poor," also "Christian love in its highest manifestation," from Old French *charité* "(Christian) charity, mercy, compassion; alms; charitable foundation" (12c.), from Latin *caritatem* (nominative *caritas*) "costliness; esteem, affection," from *carus* "dear, valued" (from PIE **karo-*, from root **ka-* "to like, desire"). In the Vulgate the Latin word often is used as translation of Greek *agape* "love" — especially Christian love of fellow man — perhaps to avoid the sexual suggestion of Latin *amor*). The Vulgate also sometimes translated *agape* by Latin *dilectio*, noun of action from *diligere* "to esteem highly, to love".

In 1 Corinthians 13, Paul places the greater emphasis on Charity (Love). "So faith, hope, love remain, these three; but the greatest of these is charity." First, because it informs the other two: "It bears all things, believes all things, hopes all

things, endures all things." According to Augustine of Hippo, from a temporal perspective, love lasts, while "Hope isn't hope if its object is seen," and faith gives way to possession. This view is shared by Gregory of Nyssa.

John: To clarify further, what I'm proposing is that existential symbiosis is a manifestation of causal holism - autopoiesis. Thus life forms are temporary and evolutionary while strategic organization is more enduring at the species level and holistic principles, which build to a natural morality at the ecosystem level, manifest even deeper latent truths of nature. This structuring of levels of reality is not an illusion but the causal basis for SEC when considered as a result rather than the origin. That opens the system to natural consideration of experiences of faith and God without imposing personal judgments. There is nothing in that ontology that requires human definition in order to be true except human creations. In this view we are doing what nature does, including our ability to ignore parts of nature for a time, while experience then teaches deeper knowledge.

Chris: It's not scientific to invent a causal metaphysics and then claim Symbiotic Existential Cosmology is a product of it without empirical evidence. SEC is an empirical cosmology that matches both natural and physical science and conscious experience of ultimate reality. It is not a token, product or process of a hypothetical metaphysical description in which autopoiesis is construed to be a formative cosmological principle:

The term autopoiesis (from Greek αὐτο- (auto-) 'self', and ποίησις (poiesis) 'creation, production') refers to a system capable of producing and maintaining itself by creating its own parts. The term was introduced in the 1972 publication Autopoiesis and Cognition: The Realization of the Living by Chilean biologists Humberto Maturana and Francisco Varela to define the self-maintaining chemistry of living cells. The concept has since been applied to the fields of cognition, systems theory, architecture and sociology. Niklas Luhmann briefly introduced the concept of autopoiesis to organizational theory.

Autopoiesis is a neat concept when framed as a biological principle of feedback systems complementing physical laws, but it is teleological without being innovative, so in evolutionary terms we have to look beyond autopoiesis to the quantum basis of mutation and natural and sexual selection to see how innovation actually occurs.

John: Regarding "not free to be certain and have faith", are you sure? I must suppose not, but if you were certain I would ask what maintains that certainty?

Chris: I already explained this evidentially in the following sentences. We are living biological organisms with spiritual pretensions, in a universe with ultimate realities and empirical truths. Free will doesn't mean the arbitrary freedom to believe misinformation that has consequences for others. If you entertain a false world view, particularly a religious one that is inconsistent with how the Cosmos as a whole (subjective and objective) manifests and continue to believe this and act upon it, it has negative consequences for the future of life. There will then need to be a corrective reaction from others to avoid this exploitation and a possible Fermi extinction. That's not prescriptive morality it's natural!

The most invidious combination is certainty of faith in a self-reinforcing "autopoietic" feedback loop, which is not free-will at all. Brain studies of religious belief contrast with those of entheogens and compassionate meditators in that religious faith abets overweening self-certainty maintained by vigilance to any risks to order, accompanied by prefrontal excitation of dopamine pathways. In conservative religious societies, this is accompanied by increasing suspicion of others as infidels and holy war, either for defence, or for outright supremacy. The Western tradition declares human male dominion over woman and nature in which dominion is as a ruler walking among his subjects. In the Eastern tradition wild life is simply regarded as a lower karmic state and species identities are ignored, so one concludes the Eastern tradition is practising intentional ignorance of the sanctity of the diversity of life in favour of the round of sentient beings centred on humanity and the notion of reincarnation.

I am a faithfully non-religious person who has had a moksha experience of ultimate reality. I thus have a cosmological duty to the truth to defend the visionary state that is the quintessence of mystical experience that lies at the source of religion, while being faithful to the universe and fecund nature. I would call it a "divine calling", but it has the wrong resonance in this debate because it is too evocative of fallible spirituality. The idea that this is confrontational, or preaching a moral imperative shows a deep misunderstanding of apocalyptic paradigm change. It is controversial, to put the cat among the pigeons of complacency that would invoke a tragedy of the commons. It doesn't have to be violent or compulsive, but it is a dangerous path to travel without falling into the crack between the worlds.

And when Isa came with clear arguments he said: I have come to you indeed with wisdom, and that I may make clear to you part of what you differ in. (Q 43.63)

Vinod: Consciousness is holistic and single which can neither be divided into parts nor produced from part proto-consciousness. This fact is demonstrated from the fact that consciousness-self, subjective experiences and cognition in our functional brain is single holistic one. None of our self, SEs can be divided into parts. From childhood to youth to old age, the size/ weight/ number of neurons in our brain have increased/ decreased on day to day basis. Had consciousness-self, SEs and cognition been a dual aspect of the brain, our self and SEs should also have increased/ decreased in line with the increase/ decrease of the size/ weight/ number of neurons in the brain. But this is not observed.

Chris: Vinod's comment is correct. It applies to ALL intellectual notions of subjectivity, philosophical, spiritual and theistic. How devastating this applies to every notion you discuss. Each of the conscious researchers in these groups is attempting to reduce ultimate reality to a model of itself by using pseudo-physical analogies:

"Language is the stuff almost all human culture is made of. Human rights, for example, aren't inscribed in our DNA. Rather, they are cultural artefacts we created by telling stories and writing laws. Gods aren't physical realities. Rather, they are cultural artefacts we created by inventing myths and writing scriptures" (Yuval Noah Harari)

Using everyday rational thinking and physical sensory observation and some controlled meditative or spiritual experiences to construct models which are abstractions of objective reality that don't fit or begin to explore the depths of subjective experience is futile. This is because the methods are still observational rather than experiential, using palpable objective concepts and hoping they will fill the experiential abyss, but it's all armchair philosophy.

Subjective empiricism is completely different from these parlour games of causality. First you need to make the journey deep into the unknown conscious territory, to a possibly scary place close to where no one has ever gone before. Then you return from this quest and let us know what you experienced. That's the subjective scientific empirical method!

I did this on mushrooms with Symbiotic Existential Cosmology and reported a completely different cosmology. It has no presumptions about astral or spiritual worlds and makes only foundation statements that may seem obvious and facile but are neither irrefutable nor unverifiable, that no one has sought or been able to challenge – **Consciousness is primary but the universe is necessary. Subjective conscious volition has efficacy over the physical universe. Subjectivity is primal, although full consciousness is emergent (in the eucaryote transition). The universe rises to cosmic climax in biodiverse symbiosis and hence the urgent need to make nature and the survival of life's diversity the primary focus of spirituality.**

Note also that ultimate reality, as I experienced in Brahman had both abstract expression as the eternal 'fact' of the conscious existential cosmos, as well as being a persona Ishvara/Ishvari that is my complementary 'Elohisitic apotheosis, just as Brahman is complementary to atman. It is a direct NDE type visitation communicating an essential pivotal insight for the survival of conscious life. In a sense it is a psychic manifestation of my entheogen-induced brain state, but it is operating in an unbounded non-encapsulated form of free dynamic that just is – as an undivided whole – NOT pan-protopsycheic, not wholistic, but whole, in and of itself.

The only way we can even begin on this quest is to accept that subjective empiricism is to "take the trip" first, to make the journey to the other side as a whole and return to tell the tale as a transformed whole. We need to start by actually doing it. We can't just sit talking about it and talking about talking about it. We need to deeply explore these states as a mental cosmology in the first person, scary or not. Until we have we don't even have a handle on the question. It's no use reporting on the NDEs, OBEs Dreams and Visions of others. We ALL need to be first person experiencers of the entire cosmic geography of consciousness first!!! [See Groff's comments!](#)

Avtar Singh: Is the objective universe fundamentally probabilistic or infected with measurement caused probabilities?

Chris: It's severely infected (including with consciousness)! There is no probabilistic randomness producing actual outcomes. Its 100% "infected".

Avtar: Is fundamental consciousness an eternal universal reality rather than a late comer evolutionary biological consciousness?

Chris: SEC sees fundamental consciousness as evolving in a similar way to how we perceive the physical universe evolves. So it starts out primally vestigial like the big bang does and then, becomes consciousness with the eucaryote endo-symbiosis, and rises to climax where it becomes cosmic consciousness realised in extreme states of enlightenment in the biota which become physically asymptotic to the fundamental expression of the laws of nature expressed in symmetry-breaking. So it gets to be the full complexity of fundamental consciousness and arises when the physical conditions permit in the mid-life of the Cosmos. Eternality is perspectival, so we can look sideways on at space-time and it's eternal, everything is there from **alpha** to **Omega**, but inside, it is evolving temporally, so eternal and temporal are complementary aspects. In the temporal experiential, the interactive evolution is from **alpha** to **Sigma** a climax state of Paradise on the cosmic equator. So there's no meaning to eternal being transcendent and temporal being ephemeral illusion.

There are two cosmological processes: (1) The **gross energy budget**. This is the way traditional cosmology works, so we start with the big bang and end with a collapsing crunch or an ever-expanding heat death. (2) **Interactive complexity and consciousness**. Here the evolution is from the origin to a state of Paradise on the cosmic equator in space-time where the quantum interactive processes reach optimal climax associated with conscious biota. Looked at from the outside, life is an eternal manifestation in space-time that goes on in the mid-life of the mature universe but may end later when everything goes pear-shaped energetically. But from the eternal point of view, this doesn't matter, because the manifestation came about and realised itself. There may be more but that's the foundation.

Paul Verbos: But does anyone actually believe (or give more than 20% probability to) the theory that we live in "a multiverse" as promulgated by David Deutsch? ... I do not believe it any more because I now see a solid alternative, even more hard core in realism.

Chris: We never see the multiverse because the moment we interact discretely, it collapses into "Schrödinger cats", so your question about believing in the multiverse is a misconception. Rejecting the multiverse in favour of hard-core realism reminds me of the Gospel of Thomas (43):

His disciples said to him, "Who are you, that you should say these things to us?" Jesus said: "You do not realize who I am from what I say to you, but you have become like the Jews, for they (either) love the tree and hate its fruit (or) love the fruit and hate the tree."

Paul: Are you saying I should shut up, that you are the avatar of Jesus here??? ... You really would understand so much better if you could at least begin to grasp the best current physics. ...

Chris: I was actually referring to your use of your favoured quantum physics interpretations, to the exclusion of others, but the real tree is the tree of life's evolution and the fruit is living biodiversity, currently under threat of mass extinction.

Over the last two days, I have taken a simple practical step towards realising Symbiotic Existential Cosmology in terms of actually addressing key existential threats to biospheric and human survival. This is not going to be easy and I can't do it on my own. We have to do this together. I do know what I am doing and the quest is eminently worthy, as you all know in your bones. Casting lots on my garments is an unwise bet Paul. There is no sign on the horizon any of you have a better option. The impossible we must needs do today so that tomorrow we can know we did the right thing for all in good time.

I would like all of you to support my quest to save the diversity of life in the biosphere of planet Earth from a mass extinction on cosmological time scales, heal the climate crisis, end the risks of nuclear self-immolation, and restore the sanctity of the biota from human and AI takeover, not least so that *Homo sapiens* can survive as a species, because this is the one way I can see we can actually proceed to resolve the risk of a Fermi apocalypse before it is too late, quickly and democratically, as one is to one.

Biblical scholar

● Some years ago I was taking my five-year-old son to Auckland city by bus. He has little biblical knowledge but at one of the bus stops a tallish man with wavy shoulder-length hair and a full beard, got on. After receiving his ticket from the driver, he proceeded down the aisle toward us. My son took a great interest in the man's appearance and shouted, "Jesus." Yes, the likeness was amazing. We got a nice smile from the gentleman who, by the way, alighted near the university.

Hallelujah, Auckland

My father used to say as a doctor that he could count the number of people who had died in his watch on the fingers of one or both hands, so I want to convey to you how I see the current situation.

Let's take our **right hand** and list five existential problems of personal survival, e.g. (1) direct health and good medical science, (2) adequate access to food (3) sufficient active "income" to care for our family, (4) social safety and human contact (5) sheltered habitation and sufficient land to grow our own food if the need arose.

In the **left hand** we have: (1) An impending human-caused mass extinction of Life, (2) Human induced climate crisis, (3) A protracted acute risk of nuclear holocaust, (4) risk of AI takeover given existing human technological takeover and (5) increasing risk of collapse of technological society from economic effects of (1-4) given the fragility of urban food chains, electronic telecommunications and political and social institutions.

The realities are that we are all fiddling while Rome burns because the right hand does not understand the dire significance of the left. We all have to balance risk anxiety against practical common sense hope for the future and avoiding the health impacts of anxiety uncertainty, so what we are doing is trying to deal with the right hand issues, while we have no control over the left-hand ones. But the left hand issues affect 8 billion people and the whole future of planet Earth, while the right hand issues affect only one or the few people in our immediate family. We are forced to treat both the apocalyptic threats and the simple personal survival questions on the same footing, but they are not. None of us can have any real confidence there will be a living Earth in 2100, let alone one habitable for our families and offspring. This is insane, irrational and untenable. What I am saying and doing is sane and could save us all.

I think what we need to be aiming at are the principal existential threats to humanity and the biosphere as outlined and a human heart and mind response to put these at the top of the list of a catalytic process of communication to catalyse cultural redemption. I don't see a rationale for ranking priorities as such, because they are all urgent and the principal is survival by addressing the core existential threats as primary.

I see the key principle as preserving life on Earth into which all these crises feed without getting confused by secondary human demands.

The key is coalescence – that is accepting that the need to act is primary and drawing in people on the basis of strengthening expertise, reach and ground roots support.

I don't see this as a religious or spiritual initiative or movement as such, but it is clear that belief systems are the way deep paradigm shifts have occurred throughout history. I think we do need to believe the necessity to act to save life on Earth as a primary priority. Science has also had major paradigm shifts such as the Copernican and physics revolutions from classical to quantum and relativity but these do not impinge in the same way on human motivation. Therefore I think there is a quasi-religious dimension in it but it's very complicated and contentious, because our beliefs are vastly more divergent than our science, which is also subject to interpretations.

I am trying to take a position that upholds the sacredness of the diversity of life over spiritual elitism, speculation and religious doctrine across the board and avoids elite utopian fantasies involving human technological dominion and tries to avoid any claims that lie outside empirical science, except for primal subjectivity as a cosmological foundation complementing the physical universe. It is idiosyncratic in involving psychedelics as a technique but that isn't central to the core need to protect life on Earth except as a catalyst, which it clearly is, in invoking a connected view of nature and consciousness, through natural moksha, that differs from both Eastern and Western elite spiritual traditions.

When I planned the millennial vigil to Jerusalem, I did this in a full academic sabbatical on a paid academic salary. I had contacted the grandson of one of the founders of Tel Aviv who had conceived to host a millennial celebration in Jerusalem who agreed to host myself and Jane at the Academy of Jerusalem for a 12 day workshop on reflowering the Tree of Life. I did this knowing exactly the potential for trouble facing the conflict-ridden nexus of the three core Monotheistic religions, but mindful that the world's traditional credibility has much more at stake and is more in question, than my own idiosyncratic vision. We succeeded in doing what we intended – to celebrate the hieros gamos and invoking the epoch of the Tree of Life to culminate the apocalyptic epoch of Christianity, to complete the rite of passage to the new epoch in a short unpretentious sleight of hand to establish the key precedent. At the time I couldn't admit it was the mushroom that had sent me there 15 years before in the 1980s, because we were still in the psychedelic dark ages in 1999.

The director of the school approved my application for a residency grant at a US university, on the basis that I didn't claim to be walking on water. I travelled to the US where I visited psychedelic experts, including staying with the mycologist Paul Stamets in his little mushroom yurt temple. We then left for Bolivia and toured the burning season in the dry tropical forest and then to the Peruvian Andes, where we descended from Cusco down the Urubamba by truck and dugout canoe, emerging through the Pongo de Manique into the Amazon basin, filming burning, logging and cattle ranching, down the Ucayali, where we took ayahuasca at Yarinacocha, to Iquitos, Manaus and then up the Madeira to the Pantanal. We then traversed Europe from Amsterdam where we took mushrooms, visiting both pagan and Christian sites like Saintes Marie de la Mer to retrace the mythical steps of Magdalen and to the Vatican. We then flew to Jerusalem for the millennial celebrations, holding an all night vigil of a hundred forming the collective mashiach above the Dome of the Rock to pronounce the reflowering anointing by God and Gaia to renew the old wastes as a garden causeth the things sewn in it to spring forth, on millennium Eve and marching in a group of 13 on the Eastern gates of the Old city on the Epiphany, to declare the Gates of Mercy open and to celebrate the hieros gamos in the name of the Song of Songs at the Western wall. We were hosted by liberal Jewish people throughout. From there I transited to Nepal and overland to Varanasi to pay my respects to Kali as the most formidable form of the cosmic feminine, before returning to NZ.

If you examine the thirteen core principles of Resplendence, you will see that they are in no way any form of doctrinal religion.

Amit Aurora: Have a few questions for which I have been exploring answers. What are the means by which the world may be returned to a union with Brahman? What is the nature of the work that is called for? How is any one particular citizen-individual to be expected to engage with that work? How does situation and context affect the nature of the work? I would request feedback and answers in a more scientific way and not in a spiritual way.

Chris: My take on this is simple. Brahman is ultimate reality. The true experience of ultimate reality causes one to witness in personal consciousness the entire sweep of reality outside our usual personal view of birth and death, hence moksha is the escape into ultimate truths of ultimate long-term survival of life and humanity as a species within it. This means rescuing humanity from destroying the planet's habitats and biosphere through nuclear holocaust, mass species extinction and climate crisis. It only takes one brief glimpse of ultimate reality to make this abundantly clear. The entire flux of human urgency needs to go into biospheric redemption now. We all need to coalesce on the existential crises and provide the urgent determination to act.

If experience of Brahman as ultimate reality has any practical scientific meaning at all, rather than a self-satisfying spiritual pursuit, it shouldn't just bring bliss, but an acute redemption of planetary awakening (enlightenment), through us realising what we are actually doing to the world as we speak and what needs to be done immediately.

It has to involve transcending the zeitgeist in scientific terms and natural terms as well as spiritual self-realisation. All the other issues including ending poverty, economic sustainability, spiritual realisation, recognition that biological consciousness must not be overtaken by AI, and so on, will be resolved if and only if we direct our lives to the preservation of life on Earth while we ARE alive. It really amazes me that no one seems to be able to grasp this very simple acid test!

Grant Gillett: I agree with Chris: consciousness emerges from incarnation with the development of the ability to dream dreams and see visions and then devise ways of speaking the truth in love so that what is live amongst us never dies but lives on eternally so that death and the Norse 'Hel' lose their sting.

Joshua Davis: Grant, I concur !!!

Chris: Here's the problem with the East. The West comes from a tradition of theistic creationism. This is much more easy to scientifically reject than "Vedic science". We all know that the Sabbatical six day creation is an enchanting allegory by the priestly author in which trees are "meat" suggesting vegetarianism, but the plants appear before the solar system, so its plain wrong in evolutionary terms. Anyone with any honesty knows Biblical creationism is a false cosmology, despite repeated attempts of Christian creationist ID proponents to convince us otherwise.

But "Vedic science" is a different kind of problem.

Fig 285: The sheer profusion of galaxies in the James Webb telescope.

1. Is it true that primal cosmic consciousness on its own can generate all the complexity, solidity of the physical universe that sustains all life within it as a living climax of physical profundity becoming conscious insight? Or is it a fantasy derived from sitting in Yogic posture in renunciation from the world? If primal cosmic consciousness is supreme and complete, why was the universe created in a form degenerating into the Kali Yuga?

2. Is the Vedic notion of transcendence actually the discovery of ultimate reality, or is it just a state of seemingly egoless repose gained through costly self control, perhaps perceived as equilibrium, or joy, bliss, or “transcendence” itself? Isn’t ultimate reality a much wilder more complete experience, in which we are immersed, embedded, incarnate in the physical universe that is perhaps a multiverse teeming with the potential for mortal organismic conscious life, in the immortal passage of the generations, in which mortality and this

worldly existence, which Buddhists condescendingly call “mundane existence” is not illusion at all, but the edge-of-chaos climax of cosmic enlightenment becoming manifest in us?

3. Is our ultimate duty to transcendence over “mundane existence”, or to be fully immersed in intimate immortal symbiosis with the entire flux of life, so that consciousness throughout the universe can come to know and transcend itself in physical, biological and subjective conscious “gnosis” of the entire cosmic condition, manifest both physically and experientially as one is to one? Can we afford, even for a moment to deviate from the ultimate respect of life to an illusory transcendence, which causes us to demote the life of the Cosmos to a mere stepping stone to be discarded in full union?

If the answer to any of these critically important questions is that the Vedic assumptions may not be 100% true, it is then our “divine” duty to seek the truth of ultimate reality in the raw and not hold back in renunciation from the high noon of existence, to settle for the slumber of renunciation of the physical cycle of life in favour of endless, dreamless sleep of “transcendent” samadhi.

If samadhi were true enlightenment as expressed in the Vedas three thousand or so years ago, humankind would already be enlightened and the world would be a blessed blue-green planet, where there are no nuclear weapons, where asteroids are avoided and the diversity of life is resplendent in immortal paradise. It is not. There is no sign that Vedic insights lead to any urgency at all to preserve life immortal or to reject the use of ultimate nuclear force, as indeed the Bhagavad Gita declares. Therefore the prosecution rests with the evidence before us.

John Kineman: The issue is that a logical description of oneness also has to be constructed in such a way that it explains illusive breaks of that oneness into the separate systems we seem to experience. It is not as simple as just saying “One” or “not One”; with regard to knowledge, it has to explain both.

Chis: Why seek oneness at all? Isn’t it a monolithic clunker?

John: Seeking knowledge is seeking oneness. There isn't an alternative.

Chris: I see knowledge as seeking ultimate reality, not oneness.

John: Since enlightenment is a human experience, science should be structured in a way that does not exclude it.

Chris: But this is not conceding that science can also include it. It is a plea for the ineffable. That’s not mysticism but mystification. How do you distinguish hard oppressive oneness from soft diverse oneness?

John: What are these ideas? I haven't encountered them and have no idea what they mean. Are you referring to social structures? That isn't Oneness. Oneness isn't material. Forcing things together or into a mold doesn't unify anything. Understanding unifies.

Chris: Take the Islamic view of scripture, sharia and society together as a coercive monolith reinforced by death for apostasy if you want a cogent example. Atonement "at-one-ment" is also a noir concept in the sense of making amends for a wrong or injury, in atonement for our sins. Understanding doesn't necessarily unify and shouldn't if it is aiming at truth. Moksha can take you outside the inside out and then you hit alien territory and realise both scientific and religious assumptions are cartoon level descriptions that are manifestly in contradiction to nature. It may put you outside the box but it doesn't and shouldn't necessarily lead to unity, but rather a paradigm shift.

Chris: Oneness is a misrepresentation of emotional empathy, typified by the MDMA experience of oxytocin touchy feely togetherness. If that's enlightenment, we can all give one another a pat on the back and get tingles down our spine and let the forests burn! So enlightenment and the pursuit of knowledge cut deeper than mere empathy.

John: It seems that you are confusing love with pleasure and oneness with irresponsibility. The likely reason for those mistakes is conflation & confusion of material and spiritual domains of existence.

Chris: That is your own confusion speaking! You really can't try to claim I am confusing material and spiritual and by doing so you are reifying spiritual. All the evils of religion emerge from higher spiritual notions turned into doctrine and then retribution for deviation. I'm simply pointing out that MDMA causes a "chymical marriage" experience, probably due to oxytocin, which is socially conducive to oneness but can't be claimed to be enlightenment. Psychedelics on the other hand can result in a "chymical moksha" of subjective consciousness and natural reality with radically different outcomes from Vedic renunciation, as I keep trying to explain which can't be at all easily dismissed as maya or illusion and may be the "sang raal" – or natural Holy Grail of existence.

John: There is no intellectual bridge from scientific models to the actual experience of enlightenment. I consider enlightenment to be realizing one's true nature beyond all description. It is our natural state discovered by practice. As such it can't be described or represented by any equation, relation, or other syntax; It is pure meaning. But it does not in any way preclude science.

Chris: There are a chain of assumptions here, each of which I question. Why is there no bridge? Is this really true? If you claim it is our natural state, why is it presumed to be beyond all description? And what kind of description? The Upanishads? The tales of the vision quest? I see this as a tacit assumption of Eastern thought that is probably untrue. And what is "pure meaning"? I think this is mystifying enlightenment, which if it is a natural condition, as you say, is experienceable and fully bridgeable by undertaking the experiential quest oneself. Anything that can be subjectively experienced can in principle be described, if not defined, notwithstanding Laotzu's aphorism that the way that can be told is not the Tao. The description is not the experience but it can point to it, just as his statement itself does.

To take an example. I can make the claim that enlightenment is a fully natural condition that can occur in the biota. That both meditation on its own very slowly and under psychedelics more effortlessly can lead directly to bridging the gap. That this state is knowable and fully describable in a way which allows the subject to know what is happening and to appreciate its significance. Furthermore I can say that the very long slow meditative route tends to arrive at states which are informatively sparse and lead to notions like emptiness which in the TM approach is described as transcendent bliss over the divided regimes of physical reality and consciousness. Hence you seek oneness. But Brahman is *sat chit ananda* – "existence, consciousness, and bliss" or "truth, consciousness, bliss". This is a more troublesome question and the trouble comes with "existence" and "truth".

I can counter the ineffable with the idea that psychedelics do something physical to the brain which also then escapes the ego and leads to an experiential flood that leads to transcendence in a much more informative way, making the mystical state both real and realisable. You can try to counter that this is an unnatural prop and that enlightenment can only be gained by renunciation, delicate persistent meditative control and seeking the resource of enlightenment within ourselves unsullied by chemical or gross natural influences, for fear of "breaking down the doors of perception with an axe" as you have said. But I can refute this on the basis that the egotistical condition is an evolved necessity for organismic survival and that the isolated human species is not a natural receptacle for enlightenment, except in the cases of a few visionary individuals, who are genetically endowed with a propensity for visionary states and these become the sages to which everyone turns to justify a process they can't themselves achieve because they don't have the same brain chemistry. For example natural serotonin levels can vary up to 100-fold between individuals. Hence the rareness of samadhi and moksha and the futility of claiming the meditative route is the "oneness and only" route.

Furthermore I can claim that this evolutionary process is entirely natural and a feature of the way the diversity of life evolves to fill all the available niches, one of which consists of tweaking our brain dynamics so that, given added meditative techniques, can bring neurodynamics asymptotically into a cosmological state, once the external polarities of self and other are relaxed, so that we enter into a kind of cosmic reverie in which we can observe the inner states of consciousness in more definitive detail.

Up until this week, I was working on the basis that meeting Brahman is a “higher” state of consciousness in the Eastern model, but on reflection, I realised the whole assumption of “higher spirituality” is a Vedic doctrine that doesn't make natural sense at all. Neither does the assumption that matter is a more gross form of consciousness, nor that the quantum universe can just be generated by the conscious mind in samadhi. I think this is insulting to both conscious life and the universe. There is no point in the Cosmos going to the trouble of making the awesome universe in which we exist and in which life is possible, if we just stare at our navels and say it just a dream in the mind of Vishnu, while we are literally trashing the planet and don't know what to do about it. So I am seeking a completely new kind of middle way that is both conscious and physical entwined at the edge of chaos between the two. This is the very foundations of cosmology speaking.

Let me try to explain my journey and where I think it might be heading to help everyone make sense of this. I started out in the Western tradition as a liberal Anglican then read William James' “Varieties of Religious Experience” and began taking psychedelics. This showed me all the religious and scientific assumptions about consciousness were out the window simplifications. Then I settled into academic life and on my first sabbatical set out to travel the world's cultures as a primal 1pp savage, with three priorities (1) to go to the sources of the world's power plants, (2) to travel India and steep myself in the life of the temples and (3) to interview as many Nobel laureates as I could about life the universe and everything. I did all three, bar the first Amazon journey which came four years later.

Then I started being a mushroom visionary, living with the ally as a mycologist, and had ongoing visionary experiences as well as attending the Native American peyote church and taking ayahuasca in the Amazon. This brought me to a point of realisation that I was secretly practising a sacramental “religion” which had the capacity for transformatively transcendent experiences that made the Christian Eucharist by comparison an empty vessel of the flesh and blood of Jesus. It could heal the biosphere in a new intimate symbiotic life culture of immortal survival. Christianity had originally taken the West by storm as a pagan-Hebrew hybrid in which Christ was a man-god psychopomp administering eternal life amid the blood of martyrdom, Crusade and Inquisition, in which the Gnostics and the Witches were burned and drowned and Yeshua's crucifixion became the example used by Islamic suicide bombers and the pilots of 9-11 to wreak terror on the innocent.

I couldn't admit to any of this psychedelic mysticism because mushrooms were first schedule forbidden substances, but I began to write the precursor of Symbiotic Existential Cosmology in “Unified Field Theories and the Origin of Life”. Then in the 1980s on a mushroom trip on our wilderness land, the mushrooms told me that if the world hadn't fixed the biosphere by 2000 I should go to Jerusalem and pronounce the epoch of reflowering the Tree of Life. I duly kept the covenant with this in my 1999-2000 academic sabbatical vigil to the Amazon, Jerusalem and Varanasi, so that I pronounced the sacred union of Shakti-Shiva in the Song of Songs and the reflowering of the Tree of Life hidden since Fall in Eden as the epoch succeeding the apocalyptic, as simple rites of passage on millennium Eve and the Epiphany.

As followers of Eastern traditions, you all accept the notion of karma, so I saw in my name and birth date and its relation with the genesis of nuclear weapons, and my now holding the holy grail of the sacramental tradition as a karmic responsibility which I could not fairly afford to ignore. The quest to save the Tree of Life from existential annihilation and end the risk of nuclear Armageddon is too potent an apocalyptic context to abandon, even more serious to planetary survival than the siege of Jerusalem in AD 66. In the same way the “four sights” of Buddha – age, disease, death and renunciation are a crafted basis to see the Gautama's role as karmic. You can blame it on Carl Jung and Joseph Campbell! At the same time, the Gospel of Thomas shows Yeshua's teachings to be idiosyncratic insights speaking of genuine creative paradigm-changing inspiration, although his Dionysian propensity for chaos in the canonical Gospels took him and world history over the edge of chaos into violent oblivion.

All my visionary experiences head into what the East terms samadhi and moksha and my last epiphany was an iconic meeting with Brahman, in which Ishvara/Ishvari or 'Elohim ever so compassionately informed me that their eternal consciousness, which was also my consciousness, was as vulnerable as my mortal life, because without life, cosmic

consciousness has no observer and can become lost to history. So because I am mortal I must needs save the life throughout not just the biosphere, but the entire universe, which I have been endeavouring to do ever since, in writing Symbiotic Existential Cosmology and communicating with you all in the process. I am writing it as a Rosetta Stone for enlightenment, truthfully as I have experienced it as the primal savage, meaning the conscious mind of the forest dweller, (Old French *sauvage* Latin *salvaticus, silvaticus* "wild, woodland," literally "of the woods"), just as the Brihadaranyaka Upanishad declares. This native vision is not Maya not illusion/delusion. It is 1pp truth-speaking.

But I also have a deep relationship with and responsibility for Vedanta and for the shamanic and animistic traditions, as the Quetzalcoatl passage from "The Plumed Serpent" states, as the avatar on the stepping stone between the day and the night (order and chaos). The same way this speaks of transcending the Christian doctrine, it also means reviewing the tacit assumptions of Vedanta, as the silvan savage I have become through my fate. In particular it means liberating the etherial tower of ephemeral astral and spiritual fantasies that are extraneous to the deep truths of Vedanta and have simply become part of the reincarnation doctrine that reduces samadhi and moksha from a realisable vision quest in this life into a miasma of realms like the Buddhist wheel of life, with fictitious titans and hungry ghosts and makes for an endless cycle of waiting through infinite lifetimes with no real prospect of global realisation of the precious life our planet nurtures and which gave rise to our conscious existence and will sustain us in millennia and millions of years of evolutionary flowering, if we don't commit a tragedy of the commons first, both through our business-as-usual exploitation and our cultural, social and religious elitism and hubris towards the diversity of life.

This is what I mean when I say that the buck stops with us here and now for the entire state of the universe. This is why I say ultimate reality is also the universe in which we consciously exist. To truly experience enlightenment is not the end of an ineffable road. It is not Omega but Sigma immersed in Paradise in the immortal life flow. Bob in his post suggested the immortal didn't need protection because they were "beyond ordinary notions of physical, biological life and death". This is dangerously untrue. The whole scope of life immortal is vulnerable when we don't yet know life exists elsewhere. The one meaningful act and primary responsibility we have and can perform is to secure the protection of life immortal and particularly those life forms, such as the smaller primates who could regenerate conscious life as we know it in a human-caused catastrophe and with them their verdant habitats. Otherwise it will be only the rats who can save it. Acting to save the Tree of Life to me is the true mark of enlightenment, not just experiencing bliss, or its conscious higher and fewer tail feathers in the aether.

John: Thanks for this wonderful autobiography! In previous posts you may not have seen I related much of my own journey to biospheric evangelism, which began with a vision of the jungles of Africa when I was very young, despite my programmed development as an engineer and physical scientist. The vision eventually won out bringing some expertise in rigorous realism (overly constrained in the physical sciences) to the more spiritually entailed world of life, with a keen desire to the deeper reality there, eventually including my own and our own psycho-physical and bio-spiritual nature - mind-body-life-spirit.

Perhaps preservation/conservation, respect for life, is the enlightened state - I think so too. But is nature created in a way that can truly be destroyed, or is it our own experience that we impoverish by taking that course? Is it perhaps the case that nature gives each new life the opportunity to learn this lesson, making a temporary sacrifice to allow it? How far we might go may be up to us, while nature, ever self creating, can be patient as well as offering both beauty and correction. When we learn that we harm nature only by harming ourselves more, perhaps then the collective evolution will take a different path.

Chris: Your experience of the houses appearing on the other side of forest reminds me of a dream I had as an adolescent, in dry parched trees on the edge of the desert and a Lion was staring at me with eyes of both pity and deep contempt and sorrow, because I was of the species which was bringing nature to her knees.

And yes you are right about nature. My second peyote meeting at Taos pueblo had both a male roadman and a female mother waters. Bertha, the mother waters said that we are suffering hurting the Earth, but nature can look after herself so we should take care not to harm ourselves by our desecration of nature. Of course this is true, but the costs are dire. We know life has survived the Permian extinction and the Chicxulub asteroid that wiped out the dinosaurs, but the kind of damage humanity is inflicting is insidious and pervasive. A study by scientists at Israel's Weizmann Institute of Science (Greenspoon et al. (2023) concludes that wild land mammals alive today have a total mass of 22m tonnes. Humanity now weighs in at a total of around 390m tonnes. Domesticated species, such as sheep and cattle, in

addition to other hangers-on such as urban rodents, add a further 630m tonnes. Thus as of 2023 wild land mammals represent only $22/(390+630)=0.02$ or 2%.

You are right that in a major planetary crisis, nature will survive humanity and humanity is very likely to be the first to go due to cultural fragility. But do we want to self-annihilate, leaving the world to the rats, slugs and slime moulds to regenerate over another 100 million years? Yes eucaryotes will survive. But the dinosaurs never recovered did they? We really do have the capacity to cause a mass extinction by combined whiplash of climate crisis tipping points, global habitat destruction and a nuclear holocaust caused by xenophobic frustrations with the very processes we are setting in motion and their negative impacts on economic and cultural survival. I'm not a pessimist, but I think the world does need saving from itself and humanity from our worst instincts.

One of the things about the Western tradition is that it believes good human social action can collectively change the zeitgeist. It's harder to do this in the Vedic tradition because it preaches individual renunciation as the ultimate solution. The Western tradition is apocalyptic and that's a call to action. If ever there was a time for an unveiling it is now. It doesn't have to be violent, or confrontational, after all apocalypse is the bridal unveiling in the hieros gamos. That is the true oneness we are seeking! I support climate and biodiversity activism in the way Greenpeace does, but it's not enough in itself, so I'm trying to go both high and deep when the others just go high and low, both as activists protecting the mangroves and corals and business as usual in the coal pits and hamburger farms.

We are an intelligent cultural species with a deep visionary tradition. Given a plate of entheogenic fungi dropping spores and occasional deep meditation in the midst of the good life, we have all we need to conceive a deeply mystical culture that has the time and grace to preserve the diversity of the living biosphere throughout our generations at the same time as experiencing all the wonders of existence. Because we ARE smart we can build technology that will reduce the risk of a comet or asteroid strike by an order of magnitude. We can devise medical science to use mRNA to vaccinate individual cancers and go a long way towards making Paradise a meaningful word. But we don't need to become supplicant to AI and we can do these things only with care and compassion for life as a whole, even if some people fool themselves into thinking they are so smart they can make a technological cultural utopia that can save us from ourselves. Cultural life is exceedingly fragile. Lethally so. Hence the urgent call to coalesce!

I already mentioned the Gita about nuclear war to John, because it makes an acid test of holy activism:

Wondering if he should renounce the war, Arjuna seeks Krishna's counsel, whose answers and discourse constitute the Gita. Krishna counsels Arjuna to "fulfil his Kshatriya (warrior) duty to uphold the dharma" through Karma ("action").

This is precisely what I am doing by citing my own karma and taking on the mass extinction of life as a primary Kshatriya, but for the preservation of life rather than its extinction.

India has preemptively armed itself with nuclear weapons:

On 18 May 1974 India detonated an 8-kiloton nuclear device at Pokhran Test Range, becoming the first nation to become nuclear capable outside the five permanent members of United Nations Security Council as well as dragging Pakistan along with it into a nuclear arms race.

The acid test of the Vedic tradition, is to commit to holy war and this is precisely the atmosphere in which nuclear war was invoked upon the planet:

It is striking that, following Oppenheimer's lead of naming the site of the first nuclear test "Trinity," Weisskopf and William Laurence - both Jews - saw in the Bomb the glory of Christ. In the Jewish tradition, the character of the Messiah has distinctly human dimensions, a "Son of Man" rather than the "Son of God" of Christian eschatology, while the Christ metaphor speaks to an experience that dwarfs the human realm. Ferenc Szasz notes, "Others whispered, more in reverence than otherwise: 'Jesus Christ' ". Known to be something of a mystic, I. I. Rabi described Trinity by the overwhelming light that engulfed him.

So we have a double paradox. The Gita preaches holy war, but does so based on the dharma of the meditative tradition of the Upanishads, as much as a millennium earlier. The key difference is that the Eastern tradition preaches individual enlightenment while Western religion is social in basis, brotherly love, altruistic punishment and simple faith in Jesus as psychopomp or Yahweh in the Hebrew tradition. The contrast couldn't be more obvious.

Coalescence is a really simple effective response – to simply address the existential problems by mutual agreement: (1) to forsake nuclear, chemical and biological warfare, (2) to stop trashing the climate and convert to renewable energy and (3) to stop consuming all the available habitats and causing an irreversible genetic and species mass extinction of life on cosmological time scales. It is the most grievous sin any species can commit. We are each culpable by our failure to declare we even agree as a primary existential priority.

John: I see Vedic India in almost the same way. What has India not had to endure? And yet even a thousand years of occupation has not squashed the gentle power of Vedic wisdom. We in the West, like Diane, think fighting is always the answer. What does it produce in the end? Spiritual India continues today in an unbroken lineage that has endured since the Pleistocene. I misspoke in an earlier post saying it is the longest enduring 'culture' on Earth - There are much older native cultures as was pointed out, but I meant civilization. It is civilization, crowding ourselves into cities, that takes us away from nature. And then crazy unnatural philosophies and political power systems compete. But India has absorbed and tolerated everything that has been thrown at it.

Chris: Yes there are more ancient cultures and I swear by the San for their 150,000 year history of survival as a culture, but I don't think we can excuse the Vedas because of the Muslim and Colonial occupations either.

John: Vedic understanding places spirit before material in every way, in origin, in time, and in importance. It think it sees creation as it really is in nature.

Chris: You are still expressing exactly the attitudes to life in the Vedantic tradition that give cause for concern. This comes full circle back to the very core of the problem. Life is natural and it is physical as well as conscious. Placing spirit before material just defers human physical dominion over nature to spiritual dominion. Then you cite "creation" again, stranding life as "God-created" rather than naturally evolved, robbing nature of her primal fecundity.

Here is a brief quote from Aurobindo which goes to the core of this problem:

According to Sri Aurobindo, in conformity with the oldest Indian scriptures, matter was created by the ultimate or supreme consciousness seeking manifestation. In order to manifest, supreme or absolute consciousness, starting from the full fluidity of the spirit, created graded planes of being, till it reached the state of manifesting the solid density of matter. Sri Aurobindo calls this the process of Involution. The involution of consciousness is the process in which the Supreme or Absolute conceals itself more and more by creating planes of consciousness of increased density, in order to create the density needed for physical manifestation. In each of the planes that were created during the involution, (called typical planes or graded worlds) the absolute or divine consciousness veiled itself increasingly till it was able to produce and manifest the various forms of solid matter. ... He continues to explain that in matter the ultimate consciousness is concealed, but the Will of the ultimate consciousness behind this evolutionary process is a gradual unveiling till it reaches a full manifestation of divine life in matter. In other words the evolution or unveiling of consciousness started from the time solid matter manifested.

This is an evolutionary form of religious creationism that is inconsistent with everything we know about the universe. The explanatory gap of the hard problem works both ways. If the objective nature of the physical world can't represent subjective consciousness, neither can the fluidity of spirit traverse the explanatory gap to generate the fermions of matter. The wholistic nature of conscious experience simply does not have the characteristics to create solid matter, and if it did, there is no way the laws of nature would actually be physical laws. We know how fluid dreams can become, with no rhyme or reason. The big rip is one thing, but what about Vishnu waking from his dream? What then? To say that cosmic consciousness had to contrive the entire physical universe makes no sense at all. If consciousness is supreme at the outset, why create matter at all? And if the entire purpose of existence is to regain enlightenment, why weren't we all enlightened in the first place? This simply doesn't have any of the characteristics of a theory of everything that can explain the standard model of physics, let alone life, and the standard model is symmetry broken in a way which implies the perfection of symmetry is violated so that life can exist. And it's life that generates consciousness and enlightenment as we come of age.

Something shadowy murmured in the corner of my mind and I went back to the full passage of Michael Ortiz Hill on [Trinity](#) in "Dreaming the End of the World: [Apocalypse](#) as a rite of Passage "... and of course out of it spills – the Gita courtesy of Oppenheimer – so here we are wrapped up in the nuclear Gita, with yours truly railing against the impossible, to grab hold of the tiller across the Styx, before apocalypse strikes ... and Paul called me an avatar of Jesus ... so do we coalesce or not?

Oppenheimer said, "We waited until the blast had passed, walked out of the shelter and then it was extremely solemn. We knew the world would not be the same. A few people laughed, a few people cried. Most were silent" **He recalled the terrible and ecstatic eleventh chapter of the Bhagavad-Gita, where the warrior Arjuna requests that Vishnu display the nakedness of his transcendental form. Arjuna is cowed in holy terror as the god visits upon him "the radiance of a thousand suns" "Now I am become Death, the destroyer of worlds".**

Chris: I think we all need to understand that there are three paradoxes here:

- (1) The journey **IS** the destination – Enlightenment is **not an end state** – It's the beginning of a journey of world redemption.
- (2) Wherefore **by their fruits** ye shall know them – The fruits of enlightenment are the **acid test**. If people claim to be enlightened, how do they seek to transform the zeitgeist?
- (3) The two paths **mutually attract** – I take entheogens AND I meditate, so there aren't two paths – **they are two parts of an organic whole**. Neither is complete without the other! So much for the talk of oneness!

I don't accept any kind of "transcendent" state and I don't accept an Omega "end point" of enlightenment. Enlightenment in the Eastern tradition is so rare everyone talks about transcendence to get there. So they don't even discuss what to do with it after, or what it does for us all or the world – just bliss, bliss, bliss! Transcendence is passé!

Fig 286: A quechua belt handed to me by a teenage girl in Cusco, before we went down the Urubamba to the Amazon, who said her grandmother made it. It is the braid of life whose process is unending and unrepeated until death us do part. Not one of the white ornamentations is repeated. Each is unique on both streams above and below. Enlightenment is ongoing, not an Omega state.

The Gospel of Thomas is full of paradoxes: *Yeshua said, "When you come to dwell in the light, what will you do? On the day when you were one you became two. But when you become two, what will you do?"*

What does this even mean?

Alex Hankey: Transcendence is automatically achieved once you correctly practice Pratyahara. Several authors like Sri Madhukarnath (Sri M.) have shown clearly that 'Enlightenment' is the starting point for the next phase of the Spiritual Journey, but this time a journey of a very different nature, serving humanity as a Spiritual Master.

Chris: Brilliant Alex! We need to be able to turn Copernicus inside out to find the truth. Paradigm change is essential. There are many traditions that speak of root redemption, so redemption of Vedanta is legitimate.

Judaism for example has a notion: *Tikkun olam* (Hebrew 'repairing of the world'), which refers to forms of action intended to repair and improve the world. In the Aleinu prayer, it refers to the eradication of idolatry. In Lurianic Kabbalah, the "repair" is mystical: to return the sparks of Divine light to their source by means of ritual performance. In the modern era, it has come to refer to the pursuit of social justice or "the establishment of Godly qualities throughout the world" based on the idea that "Jews bear responsibility not only for their own moral, spiritual, and material welfare, but also for the welfare of society at large".

I like these accounts, particularly the Kabbalah notion that in the Fall from Eden when Yahweh cursed woman and caused mortality, the sparks of the Shekhinah the feminine face of divinity got scattered and have to return in the end of days to make the universe whole again. It's a kind of counter current to the authority of God, saying indirectly that God erred. And I like the idea Jewish people should take responsibility for the good of all people, not just themselves.

Joshua Davis: indeed, the Father is incomplete without the Mother (Shekinah) and the son is incomplete without the daughter, and so it is from Genesis to Revelations, as it is written:

26 And God said, "Let us make man in our image, after our likeness,...."

כְּוִיָּאמַר אֱלֹהִים נַעֲשֶׂה אָדָם בְּצַלְמֵנוּ כְּדְמוּתֵנוּ וְיִרְדּוּ בְדִגְתַּי הַיָּם וּבְעוֹף הַשָּׁמַיִם וּבַבְּהֵמָה וּבְכָל-הָאָרֶץ וּבְכָל-הַרְמֵשׁ הַרְמֵשׁ עַל-הָאָרֶץ

27 And God created man in His image; in the image of God He created him; male and female He created them.

בְּוִיבְרָא אֱלֹהִים / אֶת-הָאָדָם בְּצַלְמוֹ בְּצַלְמֵ אֱלֹהִים בְּרָא אֹתוֹ זָכָר וּנְקֵבָה בְּרָא אֹתָם

Chris: Yes – I feel so good about the 'Elohim! and the priestly author of Genesis 1. Brahman also manifests as the Godhead Ishvara, but all the Shakti worshippers refer to Ishvari, so there it is again – the 'Elohim Ishvara/Ishvari!

Joshua: My times in India in my two journeys (~6 months the first and ~2-3 month the second) gave me a great insight into the many similarities present in the spiritual foundation of ancient India and ancient Israel and their many mystic, sages and saints insights, this is one of the reasons that allow me to appreciate your purifying work with the members of the groups that you interact with. Peeling the layers of doctrine and dogma as the accumulation of culture, politics and religious rituals takes great courage, and that leads to very valuable pearls of wisdom. The core message is that there is no substitute for personal experience, revelation and prophetic vision. Your work and life is very valuable and well appreciated from this corner of the Coromandel peninsula !!!

Chris: Thanks a million Joshua! I really appreciate it and it's an improbable rough and even perilous ride, but we are in it together for the same journey of discovery.

I want to draw the attention of you all to something that is pivotal to the difference between the Eastern quest for Samadhi and psychedelic quantum change experience. Samadhi is conceived of as a "transcendent" state. You are both expounding ontology of some kind of state, but the journey to enlightenment is hypothetical and all caught up in a religious belief in these transcendent states that require a whole lot of control that takes literally forever to get to real moksha and are associated with a life style of renunciation from the affairs of life, like family, survival and professional responsibilities. If you are a doctor, you need to treat your patients. If you are an ecologist, you need to save your species. India is full of "holy men" with charity cups, just as the Orthodox Jews in Israel get out of doing military service. It's religious exceptionalism!

The gold standard of moksha is a quantum change experience. Once entered into and fully experienced, everything is changed. Both you and the world are a different place. You don't have to sit with eye's half closed in a full lotus position while your patients die of heart attacks, or your species get gobbled alive by exotic parasites. You can live as a biological organism in a natural biosphere knowing you are mortal, but it's the best of possible worlds. My moksha two years ago consummated a lifetime of spiritual experiences of a similar but less iconic kind. All psychedelic experiences, whether heaven, or sometimes doom about to strike, contain this secret. Also they are not coupled to a notion of spiritual transcendence but to a natural sacrament of the biosphere that brings complete conscious immersion and integration with natural life without forcing spiritual unity.

What we and the world needs is exactly what nature has provided us with, particularly in the scientific and technological age. A biospheric sacrament which enables us to experience life liberated from our incarnate egos, evolved by mammals as an existential protection, and do it in a way which transforms our entire notion of what being inside and outside our incarnations is all about. In the modern world, we need to have direct traffic between the mundane and the transcendent that is powerful enough, so that we can have "been there" and have "done that" and now our lives are changed for the good and we can get on with the good work of planetary redemption. People used to call DMT the businessman's trip because one could literally walk out of the office and inhale a deep breath or two and go rocketing into stardom and go to infinity and 15 minutes later walk back into the office and get to work.

Of course this needs to be combined with a natural spirituality and good meditative practice to really get to the core of the mystery. I did this iconically on my SEC trip because it had been years and I did it only to find the secret of existence and used complete meditative annihilation to descend into the abyss. But the point is this. I don't have to expound the ontology of transcendent states. The actual secret is a way of experiencing existence outside our incarnations that heals the round of birth and death. That heals Buddhism's lament about "mundane reality" in one fell swoop even if we are struggling with physical maladies. That's why people in terminal conditions get respite and come to existential terms of acceptance with their condition. Above all this needs to make us aware of the world's great existential risks.

Jerry Fodor famously said: "Nobody has the slightest idea how anything material could be conscious. Nobody even knows what it would be like to have the slightest idea about how anything material could be conscious."

I will add: "**Nobody has the slightest idea how anyone can figure how to stop the onrush to Fermi self-immolation. Nobody even knows what it would be like to have the slightest idea about how anyone can figure how to stop the onrush to Fermi self-immolation**". We need to and we need to at least discuss it.

Here is a simple proposal:

Coalescence: The idea is to coalesce on a root proposal that is in everyone's common interest, and then grow the coalescence without immediate activism but across countries as a kind of interpersonal covenant that is also a networked movement for decisive action at the right time later.

We could agree that there are three urgent existential threats to human survival (1) Nuclear, chemical and biological weapons (2) Mass extinction of biological, genetic and species diversity by habitat destruction, pollution and climate crisis (3) Autonomous artificial intelligence. We agree to facilitate a world cultural transformation to limit and end these threats to human survival as our primary priority by inviting others to form a network of like-minded people to facilitate generating a critical mass of support for eventual global action to this end. The three principles I previously mentioned in the introduction to the scientific overview: (1) That conscious life is cosmological in nature; (2) That subjective consciousness has physical efficacy; and (3) That symbiosis with nature is the key to our survival, potentially form a point of view consistent with this, although opinions may vary.

*consciousness is sufficient to existence
the universe is necessary to existence*

The empirical quest has **two components**, not one:

- (1) **Verified empirical observation of the natural world** (aka physical science) and
- (2) **Affirmed empirical experience of conscious existence** (the vision quest).

Only when both are expressed and acknowledged do we have cosmic conscious science.

In our expert groups, there are three loose trends of belief:

- (1) **Belief in the primacy of the physical** as Stan and Kashyap express in "the brain makes the conscious mind".
- (2) **Beliefs in cosmic consciousness** through meditative states, yoga, TM and the notion that the repose of meditation and Buddhist emptiness lead to enlightenment.
- (3) **Beliefs in an omnipotent Godhead** – notions of 'Elohim, Yahweh Brahma, and Ishvara and as Mike pretends, in notions of creationism/ID presented as 'scientific'.

None of these approaches work. They are **NOT root source phenomena, but "beliefs"** and they are mutually contradictory and self-contradictory.

The vision quest consists of annihilating oneself in total immersion in conscious existence, meditatively and entheogenically, thereby bursting the incarnate bubble of perception and achieving moksha – asymptosis with "Brahman if you like". This is completely different from TM, mindfulness, or compassion meditation alone, and any other form of 'spiritual' or 'meditative' belief. It is raw, natural, manifest, immanent and transcendent – everything all at once! It is the force through which the green fuse drives the flower and unites us with nature, the wilderness and the diversity of life unfolding.

No belief system can embrace source nature and no intellectual construct can imagine it. It can be experienced only by taking full responsibility for the entire state of the conscious universe as one's personal karma and accepting the consequences as a whistle blowing transformer reflowering life's diversity in apocalypsis.

Because consciousness is primary, I am a realised source phenomenon, transforming the universe through my volition and communication in Symbiotic Existential Cosmology as a Rosetta stone oracle. As long as I continue to exist, I have the implicit capacity to save planet Earth from a Fermi self-extinction by drawing the attention of humanity to the key existential threats to existence and the natural avenue to living redemption. But the communication has to take place as a primary transmission. I accept my organismic mortality and my cosmological source nature as the living Logos of natural, cosmic existence. I accept my karma and the apparent paradox of a human being pronouncing the logos as a manifestation of source nature that we all share eternally in the conscious experience of existence. Therefore, do not cast lots on the garments of whom the bell tolls.

Empirical science is and HAS to embrace both affirmed 1pp experiences and verified 3pp observations to be complete, and particularly so in the Upanishadic model, where consciousness is deemed to actually generate matter. Affirmed 1pp experiences can carry the same evidential probability using the same statistical methods as verified observations.

Scientific experiments can and have been performed on psychedelic moksha: Griffiths et al. (2019) compared “God-encounter experiences” under classic psychedelics and naturally. While “the Non-Drug Group was most likely to choose “God” as the best descriptor of that which was encountered while the psychedelic groups were most likely to choose “Ultimate Reality.” Most participants reported vivid memories of the encounter experience, which frequently involved communication with something having the attributes of being conscious, benevolent, intelligent, sacred, eternal, and all-knowing. ... These experiences were rated as among the most personally meaningful and spiritually significant lifetime experiences, with moderate to strong persisting positive changes in life satisfaction, purpose, and meaning attributed to these experiences”.

I can experience union with Brahman directly by self-annihilation. I don't need the scripture or yoga to do it, just entheogenic meditation. And it has just the transformative properties described.

The notion that Brahman can't be experienced directly in the union of atman and Brahman is a contradiction to the Upanishads, so saying things like “Nirguna (propertyless), Nirakar (shapeless, formless) something we do not understand” is fundamentally wrong.

David Attenborough’s nature documentaries have become ever more enlightening and are now able to show full details of the sociobiology of wild animals and higher organisms and convey the sheer intensity of volitional survival and the utterly resourceful care that living creatures put into their parenting, courtship and social existence amid the tooth and claw of lethal encounters of sometimes horrific proportions, which nevertheless lead to climax biodiversity in natural paradise.

Two things follow:

Firstly life is really really alive in the sense of being enlightened to persevere and unfold the lives of each animal's offspring, even when the mother is half-starving. It is not just giving up and floating downstream, but caring selflessly for the continuity of life in the fabric of living nature that becomes the climax biospheric ecology that we know is living paradise.

Secondly with due respect to the natural universe, life is physically and biologically and psychologically exceedingly complex as a reverberating whole and the entire quantum universe is fractally alive, from individual molecules to tissues, to neurodynamics to innovative evolution as a whole cosmic manifestation. So the laws of physics, like the standard model are not mechanistic at all but evoke the entire incarnate conscious experience of existence. This means that, although consciousness is primary, the universe is necessary and it's necessary to transcendence.

Physical scientists think it might be explained in mechanistic terms, but they see these mechanisms only when reducing the systems they are observing to classical approximations. Otherwise nature reigns supreme over mechanism because we can't demonstrate causal closure of the physical universe.

This means to me that Aurobindo's description of a supermind making matter is fantasy, and this goes also for the Buddhist nature of illusion, which works only while Naropa or Nagarjuna are meditating staring at their navels with half closed eyes and not coping with the natural realities of existence in the raw. By restricting the domain of consciousness to the meditative state, as a controlled exercise of “skilful practice” they are spawning a deceit about reality, because consciousness is not illusion. It may be a controlled hallucination designed by the brain to enable biological survival, but it's a veridical hallucination of reality that is root insight.

However, like Attenborough’s evocations of life’s creative resourcefulness, I support Deepak’s “universe is alive” notion in its root simplicity. He invokes the fallacies in both traditional descriptions of a theistically-created universe and of the mechanistic view of physicalist science in favour of a creative view of living existence, in which we are all participating co-creatively, as he noted on Medium:

God did not create the universe. The biblical version of creation, Genesis, is wrong, balancing it with militant atheists are wrong. noting that in quantum mechanics, everything is spontaneous, due to quantum uncertainty leading to self-evolution and total autonomy and spontaneity. And uncertainty. And creativity. All the calculations of quantum mechanics are now helping create technology, even though quantum mechanics does not imply causality or even strict determinism.

Ultimately Deepak comes full-circle to a “liberated” view of deity as the entire cosmic unfolding of experiential existence, through consciousness itself:

The biological organism with this body-mind and the universe are both objects. The subject is one. The objects are innumerable minds, innumerable modes of knowing, innumerable things known. So thought conceives, constructs the notion, governs and becomes the experience of the universe, and in infinite modes of experience. If there are degrees of omniscience, this is infinite, infinite, infinite modes of omniscience, infinite modes of omnipotence, infinite modes of omniscience, omnipotence and omnipresence. Where ever you go, there is God.

This is an inspired evocation of Indra's net, extolled in Buddhism:

"Indra's net" is an infinitely large net owned by the Vedic deva Indra, which hangs over his palace on Mount Meru, the axis mundi of Buddhist and Hindu cosmology. In East Asian Buddhism, Indra's net is considered as having a multifaceted jewel at each vertex, with each jewel being reflected in all of the other jewels. In the Huayan school of Chinese Buddhism, which follows the Buddhāvataṃsaka Sūtra, the image of "Indra's net" is used to describe the interconnectedness or "perfect interfusion" (yuánróng, 圓融) of all phenomena in the universe.

It originates in Atharva Veda (c. 1000 BCE) which is also viewed as a conscious hallucination of “everything everywhere all at once”, confounding the opponents of true enlightenment. Verse 8.8.6. says:

Vast indeed is the tactical net of great Indra, mighty of action and tempestuous of great speed. By that net, O Indra, pounce upon all the enemies so that none of the enemies may escape the arrest and punishment.

However, this doesn't mean that I accept the Vedas either, or any piece of 3000 year old wisdom, except on its empirical validity. We simply have to be utterly wild and let go all these superstructures, like interdependent co-arising. There is a real drama of existence happening in the universe and we have a pivotal role as conscious sentient beings, not just in negative renunciation, but as immanent redeemers of life. There is no illusion. There is no Maya. The buck stops with us and we have to assume complete and total karmic responsibility for the entire state of the living cosmos we find ourselves in. Anything less is a cop out.

So I don't think there is any kind of skilful practice that can suffice. Subjective conscious experience has efficacy of volition over the physical universe. This is a flesh and blood reality. If we turn away from it to engage skilful practice, we are immediately sacrificing our root numinous immanence for a shadow world of illusion. So to Hal I say – do not go gentle into that good night! Experience in the raw. Be vulnerable, be mortal, in pain if you are, but live reality to the full. That's the entheogenic lesson of life. Do not step back from the brink, but live it in its full unmitigated wildness of visionary depth and intensity for the immortal eternal transcendent reality it is.

That is where Ishvara/Ishvari meets Brahman. Naropa is like a set of spectacles that are artificially coloured to reduce blue light to help us sleep tight. Better to be in egotistical suffering and experience it in the raw to gain natural fulfilment than skilful practice that just delays the inevitable in cycles of reincarnation.

"The mystic, in petitioning the Cosmic, turns the consciousness inward instead of directing the plea to a distant external entity or power. The Cosmic is in each of us, the mystic realizes. It is not just in the reaches of space. The mystic knows further, that our Soul will answer our petition. The Soul is of the Cosmic and it guides each of us to self-action." Ralph M Lewis

Life After Death: Symbiotic Existential Cosmology on Trial

Eternal Souls versus Organismic Mortality in the Immortal Flow of Life

Chris: The whole idea of eternal individual souls is an utterly selfish projection of ourselves as dynamic survival processes wishing to extend our tenure beyond our mortal organismic lifespan. To act or think this way is in direct conflict with how life comes about. By necessity, we are mortal, because parthenogenesis descends into mutational “heat death” by Muller's ratchet. Hence sexual recombination – scrambling the message – is essential to make new viable recombinations which CAN survive. Hence we are all uniquely different individuals with egos that can't immortalise ourselves by reproduction or by imagining eternal souls to satisfy our pretensions. It is NOT Nirguna Brahman disintegrating into lots of little deluded Shiva-Shaktis of mind and body in the fragmentation of the cosmic whole. It's the creative way the living universe manifests, so that life and conscious life can rise to overflowing knowledge the universe begins to have of its own existence and transcendence. We are also conscious visionary agents, who very badly need the gift of the biosphere – entheogenic psychedelics – to even begin to understand any of this. This is the gift of conscious biospheric evolution – to be the "Catcher in the Rye" for human pretensions – before we needlessly destroy ourselves and the diversity and sanctity of life as a whole.

Cathy Reason: So what's wrong with that [wishing to extend our tenure beyond our mortal lifespan to eternal life]?

Chris: It's unsustainable, pretentious, and has no evidential basis. Like it or lump it we are all mortal biological beings. Pretentious delusions don't change anything. Living beings aren't just abstract points, for which an infinite number can stand on the head of a pin, so there is a problem of cluttering reality with all the souls throughout history and violating the biological principles that are manifest in evolving life.

Cathy: That's contrived, inexplicable, and ad hoc.

Chris: That's an ad hoc value judgment in itself with no evidential support. All eucaryote organisms have the same core cellular processes that the human brain uses to evoke subjective consciousness. I'm not a physicalist and am certain like you that subjective consciousness is real and its ability to affect the universe is real, but it's illegitimate and foolish to simply ignore the evidence from biology about how full consciousness evolves and say its "contrived, inexplicable, and ad hoc". Evolving life in many highly creative ways IS contrived and ad hoc, i.e adventitious, but biology observes certain very conservative principles such as sexual recombination that are intrinsic to organismic mortality and we need to learn from these and adapt our world view accordingly.

Cathy: Chris, what you are suggesting does not happen anywhere in nature. You simply do not get things materializing out of nowhere and then disappearing solely in response to arbitrary configurations in the physical world.

Chris: Living organisms are being born and passing away as we speak, as far as we know their consciousness with them. We can't confirm or deny the existence of other individual's consciousness. "Materialise" and "nowhere" are both physical concepts. Dreams and visions come and go. You have no idea what happened most of the night when you are asleep. [La petite mort](#) (French pronunciation "the little death") is an expression that means "the brief loss or weakening of consciousness" and in modern usage refers specifically to "the sensation of post orgasm as likened to death." Consciousness continues to be evoked while physical circumstances invoke them.

Cathy: There is just no reason to take seriously the idea that consciousness itself magically springs into existence and then magically vanishes.

Chris: Conscious experiences are transient and impermanent, and have to be, so we can deal with the next existential crisis. Consciousness can appear and disappear as a whole any time we get knocked out and/or become comatose. Unhinging the relationship between consciousness and nature leads to all kinds of imaginary spiritual notions like eternal life that separate us from life as a whole and lead to anthropocentric extinction scenarios. There is no way you can defend claiming life after death is real by asserting consciousness can't cease or it would be magical intervention.

Cathy: A conscious individual is not an agglomeration of randomly appearing and disappearing subjective "bits", any more than a Euclidean manifold is an agglomeration of points. They are patterns on the evolving manifold which is the conscious individual – that our individual conscious experience can, in part, be represented as one.

Chris: Both visions and particularly lucid dreams can create scenarios that are impossible to truly represent on any kind of manifold space. The subjective experience has to be "optimally compliant" to the physical environmental boundary conditions because subjective consciousness is forming an interface that provides anticipation and creative intentionality through resolving the causal uncertainty in the critically uncertain brain state for the organism. That's an extremely subtle multi-dimensional dynamical process forming the real boundary conditions that define our conscious experience of the world around us, which we know has to be responsive to every element of the dynamical brain state spanning all cortical areas including sensory, experiential, emotional and psychic notions of self.

The conscious brain is the physical dynamical system aspect of that interface, but subjective consciousness is afire in the reactor core in its own right, both anticipating environmental uncertainty and intentionally affecting the physical universe, in subjective conscious volition. This is primal cosmological subjectivity fully manifested into organismic consciousness by coupling fully to its "internal model of reality" as manifest like a keyboard over those cortical columns spanning all cortical areas.

Conscious experiences also transcend physically perceptual constraints. If I simultaneously in a lucid dream stare into a woman's eyes knowing I am in an alien universe and at the same time shoot upwards with the unbearable anti-gravity of dreaming while knowing the sea spray is hitting my Indian shirt and I can feel every droplet simultaneously and again at the same time I realise I am just bobbing on the ceiling in an OBE telling myself I am okay down there in the bed, there is no way to put these parallel experiences on any kind of real-world sequential time line, let alone in any kind of dimensional space. Is it in an astral universe or just some kind of experiential "space" that can image anything at all, and burst like a bubble and is not even physical space?

Cathy: But it hides the fact that we have no idea why consciousness should obligingly manifest in just such a way that physical evolution requires, and fail to manifest in any other way. It reduces to a kind of spontaneous generation -- consciousness occurs just when the physical world requires it, and there is nothing further to be explained.

Chris: The biological evolution of subjective consciousness arrives at mortal subjectively conscious organisms because this is the only way, or the only evident way, that the universe can organically manifest consciousness. The physical universe is entropic and life exists as an extreme non-equilibrium system "negentropically" on the solar irradiated planetary surface and through additional chemical gradients on a wider scale. Complex organisms with large genomes cannot exist by parthenogenesis because of inexorable cumulative mutation, so life invented sexuality and all the metazoa have sperm-ovum fertilisation with indexed genetic recombination resulting in an almost unlimited variety of singular mortal organisms called individuals, who then in *Homo sapiens* incorrectly seek eternal life, when they got here by a process which is immortal only collectively, not individually. You call this magical and ad-hoc. It's not. It's why we have the existential dilemma of mortality. If you think there is another way of resolving it, the onus is on you. You can't just claim it's arbitrary or magical.

Cathy: I'm afraid this looks like the use of tricky language to hide the fact that we don't really understand what is going on. It describes what things look like from a physical perspective. But it hides the fact that we have no idea why consciousness should obligingly manifest in just such a way that physical evolution requires, and fail to manifest in any other way. It reduces to a kind of spontaneous generation -- consciousness occurs just when the physical world requires it, and there is nothing further to be explained. But that completely obscures the reality that we have absolutely no idea *why* consciousness should do this. As an explanation for the manifestation of consciousness it is completely arbitrary and ad hoc. It only seems plausible because, in western academic culture, we are conditioned not to see this problem from the perspective of consciousness, so the inherent absurdity of the idea remains hidden behind a mass of cultural assumptions. But that completely obscures the reality that we have absolutely no idea *why* consciousness should do this. As an explanation for the manifestation of consciousness it is completely arbitrary and ad hoc.

Chris: The reason consciousness emerges in the biota is because, in amoeboid-flagellates consciousness aids the survival of the collective organism, using transcendent physics that violates causality. It's thus an extremely counter-intuitive manifestation from the physical point of view that requires circumstantial explanation. Signal in this is the huge problem a complex organism faces deciding how to survive, eat and reproduce in a wild biosphere where all the environmental problems of survival are computationally intractable to literally unsolvable because of other conscious organisms being out to eat us. So it's an insoluble problem of consciousness versus consciousness.

To solve this problem, subjective consciousness has to both anticipate emergent uncertain circumstances and act upon them in a way which changes the physical universe through intentional behaviour. It thus has to be utterly compliant with all the neurodynamic boundary conditions defining the dynamic context, or causal conflict would arise, and has to be definitive only in uncertain situations as represented indeterminately in the critically poised brain state. None of this means this is just a physical description, but it's setting out the precise boundary conditions that subjective consciousness has to adopt to succeed in doing what it has been doing since the eucaryote endosymbiosis invoked edge of chaos membranes and communication by neurotransmitter molecules in the collective single celled organism that then became neurodynamics in us.

The rest of the story we need to discover by the vision quest because subjective consciousness is private to the individual and we can lean and discover what its confounding potentialities and actualities are only by falling right into the abyss and "hallucinating" our way to the other side of realisation.

Cathy: But they are not organismic psycho-physical boundary conditions. That's the problem. They are organismic physical boundary conditions to which the psychic is arbitrarily expected to conform.

Chris: Your initial arbitrary and incorrect assumption that individual eternal souls could exist comes from denying the fact that subjective conscious intentionality has to fit seamlessly with contextual physical circumstances to survive organismically. What you are trying to do is set up a stark division between subjective experience and bio-physical cosmology that fails to understand that subjective consciousness actually has a creative role in the physical universe which we experience as subjective conscious volition having efficacy over the physical universe, even by simply corresponding in this way. You are effectively denuding subjective consciousness from interacting and neutralising its ability to seamlessly interact by insisting physical boundary conditions are not psycho-physical when they clearly are psycho-physical because that's precisely the boundary interface between subjective and objective reality. Your model is stark dualism hoping mind is another separable realm in so many words. The boundary IS a boundary Cathy in which both realms meet and if they didn't meet seamlessly all hell would break loose from causal conflict and we wouldn't/couldn't consciously exist at all.

Cathy: They don't meet seamlessly, Chris, not in your model or in anyone else's. That is what I have been trying to get across to you.

Chris: You are making two self-contradictory claims with no evidence. First you say seamlessness is arbitrary and physical when it isn't and then you say it isn't seamless. If it's not seamless show us the subjective-objective fracture seam Cathy. There is no empirical content to justify your claims.

Cathy: Let's represent the evolution of the physical world in terms of something like a state space. Let us imagine the physical evolution to be a continuous trajectory, or set of trajectories, in black. Now let us add on the set of psychic trajectories, in silver. Now, the state space tells us how the physical system evolves, *whether or not* it has a psychic component. No-one imagines that physical world ceases to exist when it is not conscious. But if we look just at the set of psychic trajectories, we see just a disconnected hodgepodge of silver splodges, defined only where there is a direct connection with the physical. And this picture is completely one-sided. It tells us how the physical world evolves when the physical is not conscious, but it completely fails to tell us how the psychic world evolves when the psychic is not physical. It assumes that the psychic world ceases to exist when it is not physical. And this makes no sense. It is only the materialist bias of our culture that enables us to see why it is unreasonable to expect the physical world to disappear when it is not conscious, but prevents us from seeing why it is equally unreasonable to expect the psychic world to disappear when it is not physical.

Chris: That's a beautiful description. However, both sets of trajectories are modelled from outside and they only accidentally come together if they just happen to coincide. The physical and psychic are independent processes that are not existentially linked. It simply doesn't in any any way even approximate to the universe in which we consciously exist.

It introduces many further problems, for one, we simply don't know the physical universe can manifest without our observation of it. On the other side, we have no confirmation of viable conscious life except in the biota. Neither God nor angels have a verifiable presence, which is why I am very wary of assertively spiritual ideas seemingly sane people continue to have. People are able to imagine these ideas because subjective consciousness is private to the experiencer so we can each conjure up really bizarre spiritual notions like your conscious trajectories, which I know were coined to make the point you wanted to explain. Spiritual people might see this as the angels and indeed the gnostic pleroma is very like this, so there is a strong element of the human imagination that seeks such notions. When I am on mushrooms I can happily see all souls throughout eternity in this way but I don't see it as any form of absolute reality and only mention it in passing. But you are using the model to try to imply there are physically undetectable astral trajectories. If we are going to survive, we have to learn to take good care of the universe and life within it, so we can't set out on self affirming illusory journeys by affirmative belief.

Cathy: But there is nothing in your model which explains the distribution of these conscious interactions, or how they assemble into conscious observers.

Chris: That's not how any of this works! You can't interact qualitative features of conscious states with fragments of brain states. The interaction can't occur because of fundamental differences between integrated subjective

consciousness and fragmentary physical processes. The only interaction is between the ongoing subjective conscious state and the coherent yet critical phase transition brain state.

Cathy: But you don't explain the existence of an "entire ongoing subjective conscious state".

Chris: All our subjective experience is the entire ongoing subjective conscious state. Yes we can focus on aspects but that just changes the whole dynamic. I didn't write Symbiotic Existential Cosmology to make it easy for you or anyone else. I am intentionally making it difficult so as not to pull any punches or turn it into the sort of pop confetti exposé popular science has become, so it's in itself a vision quest that is a research resource for the entire description.

Cathy: At last, a glimmer of light. But it's a faint glimmer, because you still don't explain how primal subjectivity combines to produce subjective consciousness. So Symbiotic Existential Cosmology has the same combination of problem as every other panpsychist theory.

Chris: It's not panpsychism because it's not psychism. Subjectivity doesn't necessarily form a psyche until it has a mammalian-like encapsulation. The whole point is that filter theories, from William James through Aldous Huxley all transform the discussion from physicalistic brain causality into filter boundary conditions in which subjective consciousness and the physical universe can actually interact and you know full well that is how the doors of perception get flung wide open. Hence Symbiotic Existential Cosmology's whole description is a cosmological filter theory of how and why subjective consciousness not only exists, but also has efficacy of intentional volition over the physical universe.

Cathy: But boundary conditions aren't enough, Chris! You would not attempt to define the evolution of the physical world solely in terms of its boundary with the psychic. So whatever makes you think it can work the other way round?

Chris: The reason is the physical universe is as nearly causally closed, as we know it to be, while subjective consciousness is about "free will" violations. Physicalists and even David Chalmers veer into the notion that it is causally closed, despite quantum uncertainty, although he has back-tracked since. So the only confirmed effects we expect subjective conscious intentionality to induce are what we see in living behaviour plus a few uncanny hunches. Even these can only occur without causal conflict when they arise through critical transitions, in which the evolving brain state is physically indeterminate. That's why Symbiotic Existential Cosmology asserts that subjective consciousness functions essentially and only to deal with existential crisis due to environmental uncertainty.

But the fact that for subjective consciousness rather than mere computational "intelligence" to continue to exist in evolutionary terms means it has to facilitate survival. Because environmental uncertainty is computationally intractable, this brings in the ultimate hard problem of having to anticipate the immediate future to avoid annihilation in the present which is a causality violation of past and future which can only mean retrocausal influences in consciousness – the worst form of spookiness. This is why we are living in perpetual existential crisis at the centre of the cyclone of this boundary condition, poised on the edge of the organismic Fermi extinction we call mortality.

Cathy: If I understand this correctly, what the [Wheeler] article makes clear is the suggestion is that a measurement selects the set of classical histories consistent with the outcome of that measurement. There is no suggestion of anything like retrocausality.

Brian Josephson: Here's an actual quote, from 'Law without Law': "Acts of observer participancy ... give tangible 'reality' to the universe not only now but back to the beginning". This is similar to your 'determinate history', but what does that mean? It's a bit like saying finding a fossil determined the past, but that isn't surprising. It's rather twisting the use of words.

Kashyap Vasavada: Perhaps at some time Wheeler got this nutty idea that current measurements affect billions of years in past. He probably changed his mind. But whatever you write in print has immortality.

Chris: No, it's not that simple. The idea is far from "nutty" and Brian's comment is pertinent. As you all actually know, because weak quantum measurement, which has become rife, shows this is not a trivial question of "classical histories". It's a manifold subtle effect that permeates all of physics. The question has to be asked "how DOES the universe, upon measurement select the set of classical histories consistent with the outcome of that measurement?"

This brings us back to all the phenomena of entanglement and the question of how type 1 processes of measurement alter all the probabilities of absorption throughout space-time and possibly beyond if we entertain the "possibilist" view of quantum transactions. Kashyap tries to trivialise this by selecting preferred bases, but the only way to get any idea of how entanglement instantly maintains correlation when one is measured is through a confirmation wave from the absorber back to the common emission event.

All of this is occluded by the "shut up and measure" approach and Qbism for all its touchy-feely bullshit flunks abysmally, both of which trivialise the question of how the universe actually makes choices. I know Grant loves Qbism but it's as bad as shut up and calculate made a social contract. Then we are dragged back to the ad hoc assumption of uncertainty being randomness when we know cats are either alive or dead and somehow a unique decision got made that becomes that indelible line of history Kashyap is referring to and is why I am lodging Symbiotic Existential Cosmology for posterity into the future, to make such a record.

This pertains to everything that happens that is not definitively causally determined, which is just about everything we make survival decisions about. The greatest failure of physics is not failing to understand the nature of subjective consciousness, which lies outside its frame of reference, but the spooky action at a distance in plain sight in quantum measurement itself. I acknowledge retrocausality in some form is a "hard saying" in the apocalyptic sense, because it challenges our notions of order and causality but that's the problem at the core of subjective consciousness.

Cathy: What are "contingent realities"?

Chris: They are all the subjective things we can't prove physically but seem to maybe be going on mysteriously. Eternal life, Deja vu, prescience, clairvoyance, Psi, deep collective memories that hint of reincarnation, Jungian archetypes, dreams and visions we struggle to make sense of. Hunches, flashes of uncanny insight. SEC puts these into the "to be confirmed by mutual empirical experience" basket.

Cathy: Well, just for the record. here is my criticism in one line: you have not explained why consciousness should obligingly pop into existence when required, and then just as obligingly pop out of existence when no longer required.

Chris: That's the breaks living in the entropic mortal coil, but the trade off is being in the centre of the cyclone rather than just disembodied cosmic consciousness eternal but ephemeral. This is why despite all, I call it the best of all possible worlds if we preserve paradise on the cosmic equator in space-time.

There's a twofold answer to your central question in Symbiotic Existential Cosmology:

- (a) **Primal subjectivity** is cosmological so it doesn't pop in and pop out. It's always there and has always been there and always will be and it permeates all phenomena in the universe in different ways.
- (b) **Subjective consciousness** is an emergent encapsulated elaboration of primal subjectivity, so it is dependent on the form of the encapsulation.

Why is Encapsulated Consciousness so Obliging to the Universe?

The filter theory says the brain is not causally closed and forms a very sophisticated boundary condition on subjective consciousness carrying all the aspects of experience spanning all cortical regions as an internal dynamical model of reality, rather than the brain determining the dynamic causally, but we know the universe is very close to causally closed, so subjective consciousness is like the genie caught in the bottle. The only way it can act without causal conflict is to leak out of the cork. This is the cubic centimetre of chance Carlos Castaneda referred to. The quantum universe is NOT causally closed and neither is it just random but is a form of punctuated stochastic causality driven by ergodic hidden variable dynamical systems. So subjective consciousness can intervene only in physically uncertain situations, which is exactly what it does, dealing with uncomputable environmental uncertainty that arises from the quantum universe. This is why subjective consciousness appears to be so obliging.

So when we die, primal subjectivity doesn't but the organismic encapsulation unravels. Does it carry on disembodied? That's for each of us to find out! One of the reasons I like psychedelics, although they can be challenging, is that they give us a chance to go to the edge of incarnation in a healthy state and come to terms with it.

SEC differs from physical cosmology, which is unconsciously comatose, and religious cosmology, which is driven by an autocratic superconscious divinity. In Symbiotic Existential Cosmology, it is WE who are the transformative agents, not God and we have to take personal responsibility for the fate of the universe and life within it.

Cathy: You can't explain that in terms of biological evolution because evolution is a physical process. Your theory asserts a functional complementarity between mental and physical, but never explains how this comes about -- only the physical side is ever explained.

Chris: I just showed you the opposite. The physical side EVOKES subjective consciousness. That IS the explanation. The conscious side is you staring out the window or cleaning up your messy kitchen! Or dreaming, or hallucinating, or intentionally planting seeds for the future.

Cathy: And how can "primal subjectivity" be said to permeate all the phenomena of the universe, when its only connection with the universe is through conscious interactions with the physical?

Chris: That's back to front again. We are aware only of our own conscious experience. We have no direct empirical evidence for subjective consciousness outside this. Even a vision of a ghost or God is a personal subjective experience.

Primal subjectivity generates full subjective consciousness in eucyote organisms as a manifestation through the subjective-physical, or psycho-physical portal. The portal is not just physical but has both aspects in a two-way handshaking arrangement. SEC is focussing on full consciousness, but primal subjectivity is the key to it all. You need to be more intuitive and enter the visionary condition to answer this.

Cathy: So we still have the question -- how does encapsulated consciousness obligingly emerge from primal subjectivity and then obligingly disappear back into primal subjectivity (a transformation which itself requires a lot explanation, by the way) on just those occasions when the functional requirements from the physical side of the theory demand them to?

Chris: The entire process is interactive and the cosmic origin did this "duplicitous" act of complementary "creation", so that subjective consciousness has a realisation. Otherwise we don't know either the universe or subjectivity could become manifest.

Cathy: And I'm not at all sure about your model of conscious interaction with the physical, either. You seem to want this to be hidden away somehow by the uncertainty principle. That doesn't usually work, as you know, because if it could, then one could use such interactions to make measurements prohibited by the Uncertainty principle.

Chris: That's exactly why the mind-brain interface deals with it the way it does. It's too early in the evolution of neuroscience to fully explain this,. You are talking about imposing external measurement in the physics lab, but life deals with this in a radically different way, so you can't try a devil's advocate deconstruction based on the physics lab. The brain is manifestly making brain waves and the EEG is not just an average of action potentials because these are in handshaking relationship with the field potentials complementing the network connections, so the whole brain looks like it is doing direct wave resonance beat sampling like the fundamental principles of why quantum indeterminacy exists ([fig 71\(c\)](#)). This is circumventing the probability interpretation to determine the variables over time and space by wave beats!

If one thinks of these as some kind of quasi-particle exciton, they can be long-lived and braided and emit and absorb one another in an entangled quantum of the present which subjective conscious experience seems to be. That's WHY people think consciousness is eternal! And these excitations are also connected to synaptic adaption and molecular memory, so just like advances like quantum computing, we have a phenomenon we are only scratching the surface of. In this view absolutely all molecular brain processes are quantum, so the brain is a quantum prediction "machine" evoking primal subjectivity to complete the cosmological process in conscious intentionality affecting the physical universe. The internal model of reality is not to "require" but to evoke and manifest.

Cathy: You seem to want to get around this by introducing chaotic dynamics, so that even if one could make forbidden measurements, it wouldn't matter, because no-one could ever know in practice what they were measurements on. But it's far from clear that the physics of this is mathematically consistent.

Chris: The empirical evidence to date is that quantum chaos leads to deep dynamical phase transition entanglement. We are going to be a long time waiting before physics is mathematically consistent. Cathy. This is only the beginning of the problem physics faces. We still have to deal with retrocausality, let alone quantum reality versus general relativity.

Symbiotic Existential Cosmology is designed above all to be an **efficient cosmology** in terms of Occam's razor, so it doesn't attempt to describe primal subjectivity *a priori* except in its attestable manifestations complementing the physical phenomena I have cited above, from quanta to human consciousness. Integrated information theory (IIT) tries to do the same thing, but without subjective consciousness, so it IS just a functionalist model. This is all that can be done without unverifiable statements of belief like eternal life. I just say primal subjectivity starts out vestigial, just as the inflationary universe emerges from a quantum fluctuation, so it's a compact consistent cosmic origin.

This is for the rigorous reason of **explanatory efficiency**. All idealistic and even neutral monist descriptions have turtles all the way down. Vedanta proposes it all began from a fully fledged cosmic consciousness that then degenerates into us and the Kali Yuga. Monotheism says an autocratic creator designed the entire universe as a clockwork orange. Even Ram with neutral monistic Nirguna Brahman is making infinite turtles by presuming an all powerful manifestable neutral entity that can make anything and everything happen – consciousness and the universe – without explanation. These all invoke more complexities and paradoxes than they resolve. SEC doesn't suffer from panpsychic combination problems because it replaces physical causality with subject-object hand-shaking, in which both are involved. Because it all happens through the interface, we don't have subjective contradictions. SEC goes absolutely as far as any empirical enquiry can go without unnecessary assumptions, and the one assumption is clearly stated as an axiom.

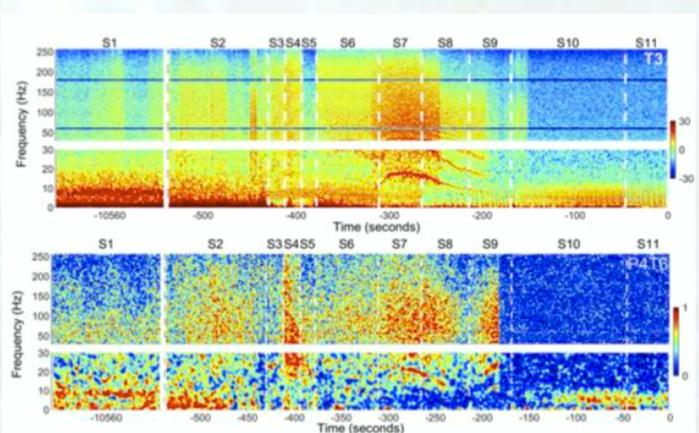

Ram Lakhan Pandey Vimal: What survives death? And does the self-aware self-as-subject survive death as a soul?

Chris King: I experience consciousness as being eternal and on mushrooms I have a visionary "feeling" that all conscious beings throughout space-time are mutually aware as disincarnate entities. But that's just an intuitive notion and could be an illusion and a full moksha experience is a "near death experience" (NDE) telepathic encounter with the Totality, not a separate personal eternal soul. So the idea of individual souls seems inconsistent with there also being a Brahmanic cosmic mind and with the moksha experience. Moksha is described as the escape from the round of birth and death. If we are encapsulated forms of the cosmic mind and the encapsulations dissolve when we die then that's maha-samadhi – the dew drop slips into the shining sea. I'm not sold on reincarnation, or on the transmigration of the souls and see it as an excuse to postpone moksha or explain why it is so difficult (and doesn't need to be). How many angels can dance on the head of a universal pin – forever and ever in one physical universe?

Mortality is the centre of the cyclone of reality. That's where it all goes down and comes down and where the consequences ensue. We are the cosmic mind caught as individuals in the incarnate bundle of life, so we myopically perceive it as egos fighting for survival and fear mortality. So we need to recognise our true nature is cosmic and take responsibility for this incarnation we happen to have and protect the abundance of life with our lives. Nothing else really furthers! This remains true, even if the cosmic mind can manifest only in the biota as a sensitively dependent neurophysiological state, akin to the quantum virtual vacuum.

I achieved moksha by self-annihilation, by giving myself back to the universe. Then I experienced Union and get told to save the abundance of life everywhere in the universe before I die. That's impossible! But the impossible we do today and the improbable we leave till tomorrow – if tomorrow ever comes. So I'm staking my lot on the journey across the Styx and no ferryman can do it for me. That's taking personal responsibility for fate.

Fig 286b: Global hypoxia-induced surge of high-frequency oscillations in the brain of dying patient Pt1 lasts several minutes after life support is removed. Above: Absolute power of left anterior-mid temporal lobe (T3) before (S1) and after (S2 to S11) the withdrawal of ventilatory support in Pt1. Below: Temporal dynamics of functional connectivity between the right posterior temporal lobe (T6) and the right parietal lobe (P4) (Xu et al. 2023).

Ram: Does your SEC framework predict the survival of consciousness (self-as-subject) after death?

Chris K: Symbiotic Existential Cosmology asserts that primal subjectivity is a cosmological complement of the physical universe and that attentive consciousness is an emergent property of the eucaryote endosymbiosis. This means essentially that self as subject is not confined to any one organism's lifetime. It's basis spans space-time and its attentive dynamics is a product of a topological transition, in the eucaryote endo-symbiosis that is also in principle cosmological. The world view of SEC is that we are conscious transformative volitional agents transforming the physical universe to create history as we speak, so it is for us to discover all these mysteries within our mortal lifetime and to protect the diversity of life in the universe. As John Donne (1624) said, the bell tolls for us to do this necessary thing, without which we cannot hope to survive as a species, and as a planetary biosphere:

*No man is an island, Entire of itself.
Each is a piece of the continent, A part of the main.
If a clod be washed away by the sea,
Europe is the less. As well as if a promontory were.*

*As well as if a manor of thine own, Or of thine friend's were.
Each man's death diminishes me, For I am involved in mankind.
Therefore, send not to know For whom the bell tolls,
It tolls for thee.*

Symbiotic Existential Cosmology doesn't predict that individual organismic consciousness survives biological death of the organism but more that in poetic terms, it is a feature of subjectivity as an "integral transform of the totality of existence". Individual eternity is a religious fantasy along with concepts like personal souls. The reality is confounding and a supreme gathering of all into the wave of conscious realisation.

I experience and have experienced cosmological moksha states that lie outside the confines of ordinary reality. I personally experience psi phenomena, like precognition, which I think are pivotal to conscious anticipation of existential threats, which is why subjective consciousness has been retained by evolution. But I'm here to manifest them if and when they do occur, not to prove them in statistical objective claims of dubious validity that will never save life on Earth, or provide for the next occurrence, or avoid bad karmic outcomes. Either we use our non-ordinary "siddhis" transparently for the protection and unfolding of life's diversity, or they are wasted.

Seeking eternal individual life is a grossly selfish quest that is part of the Christian eschatological delusion and pervades Eastern traditions as well. Trying to classify everything into a philosophical framework is likewise meaningless, because you, as a transformative agent have to face up to the ultimate reality consciously, and classifying subjectivity is just objectifying it. What do we actually do about reality, given a mass extinction of biodiversity, climate crisis and nuclear mutually assured destruction threatening our own existence? Maybe if you do really experience cosmological moksha you will realise that your organismic consciousness is just a flicker on the great tsunami of cosmic consciousness, as indeed it must be. But this philosophical speculation of yours will waste your life, to your very death bed, unless you stop this grasping classification quest and unfold the cosmic experience we all share.

I hold the Upanishads to be a deeply informative account. But Focussing on yogic renunciation has failed to achieve the protection of life as a whole for three millennia. The many Vedantists among our acquaintances simply quote the claims of the yogis as scientifically unevicenced articles of faith. I have yet to see a single first hand account of cosmological moksha or a single properly evidenced claim of samadhi. Likewise, the Western Christian-based assumption of theistic spirituality with eternal personal souls and creationist doctrines debase life's unified coherence and fecundity in human dominion. These are each self deceptions of a reality so awesome, immanent and transcendent that annihilation is the only way to approach it. Any prior assumptions like God or Creation just act to block the portal. In many ways psychedelic moksha is the opposite of meditative renunciation of life. It is the entire living conscious brain state running free of its encapsulation, evoking subjectivity asymptotic to the foundations of physical cosmology in full expression of the four forces of nature – the complete transfigured opposite of death.

The only matter of substance and true worth in this "spiritual" quest is the saving of the diversity of life now and throughout our generations forever. Anything less and we will destroy ourselves for what we fail to bring forth from ourselves, as Jesus said in the Gospel of Thomas (70):

*"That which you have will save you if you bring it forth from yourselves.
That which you do not have within you [will] kill you if you do not have it within you."*

Ram: Please let us know which of the following five possibilities survives after death per your SEC (Symbiotic Existential Cosmology) framework. Per materialist Roman, Level 0 (nothing survives) is the possibility.

Per (Delorme, Radin, and Wahbeh, 2021) in Advancing the Evidence for Survival of Consciousness:

“What does survival mean? What is meant by the survival of consciousness? We propose five meanings related to various degrees of consciousness. The term consciousness in this context includes a sense of subjective awareness (including that of one’s surroundings) and a sense of identity about one’s sense of self and personal memories. With those definitions in mind, we propose five possibilities after death:

- *Level 0: Nothing survives. You, including all aspects of what you consider to be yourself, emerge from the operation of your brain. When your brain dies, you cease to exist.*
- *Level 1: Pure awareness survives. There is no sense of identity or personal memory. This is a formless, content-less state, like transcendent meditative states with no perception of the environment as distinct from oneself.*
- *Level 2: Awareness with limited identity survives, but no personal memories or past lives. There may be a perception of some sort of environment. This is like waking up from a dream and not remembering who or where you are.*
- *Level 3: Awareness and identity survive. This includes memories of one’s immediate past life and the perception of some sort of environment.*
- *Level 4: Awareness and identity survive and can interact with the physical world. There may be a sense of identities of many past lives and perception of one or more environments. This level of awareness may include the deceased’s ability to communicate or interact in some way with the physical world and with living persons.*

Levels 1 to 4 indicate some degree of survival. Because pure awareness (Level 1) does not include a sense of identity, for this essay, we set the threshold for what we mean by survival at Level 2 or above, although most popular beliefs about survival would be at Level 3 or Level 4”.

Chris K: Symbolic Existential Cosmology is a Rosetta Stone flight-manual for conscious volitional beings to navigate their incarnation and transform the universe for the unfolding of conscious life.

In response to your four level analysis, the problem, as I already explained, arises from the notion of identity, so here is my experiential position:

- 1: Pure awareness survives (primal subjectivity), as it is complementary to space-time.
- 2: Identity, as presented, is a false concept. In psychedelic quantum change, it is the dissolution of identity that is key to the mystical experience.
- 3: At the core of moksha is a merging of organismic and cosmic identity. Moksha is the escape from the round of birth and death, so it is also the escape from encapsulated organismic identity.
- 4: Just as in the Bardo Thodol, the process of “rebirth” can involve visions of differentiation and unification of identity, so moksha is a visionary experience of “all-souls” in what I might describe as “telepathic communication” as one eternal conscious awareness.
- 5: This is the underlying experience I always have as a simple matter of fact of life when I am communing on mushrooms. I am me and I am my organismic consciousness, but simultaneously aware of and intimately part of the eternal throng of all conscious existence in the most gentle aware way possible. I am in an infinite assembly hall in which, underlying my individual identity, I/we are the legion of all conscious existence throughout the cosmos from forever and for everlasting – so be it – Amen.
- 6: For this reason, our existential duty in this mortal coil is to the preservation of the unfolding diversity of conscious life, without organismic self cherishing. This IS the immanent, transcendent illumination of mortal existence!
- 7: Without this epiphany, no cultural tradition and no conscious species can survive within the planetary biosphere and will ultimately suffer Fermi self-extinction.

Three cultural assumptions get in the way of our intuitive understanding of reality:

- (1) **Traditional religious descriptions including the Vedas and Judaeo-Christian cosmologies** try to define a god-centred reality that in the Vedas is a mind-centred theistic view but in the Judaeo-Christian view is creation-centred theism. This stops us accepting and experiencing reality as it is, either because we take the yogi’s word for it as enlightened beings, or because the scripture says God created Heaven and Earth.
- (2) **The physicalist world view tries to assert that consciousness is just an internal model of reality** constructed by the brain, distorted by perceiving conscious intentionality affecting the physical world to give us behavioural confidence, when the hidden cryptic account is that our brains are doing it all and our experience of conscious intentionality is just an incorrect self-fulfilling internal model allegory.
- (3) **The third more subtle impediment is analytical philosophy itself**, which, just as you are doing, tries to abstractly classify everything into “isms” which are too primitive to capture cosmological reality, in exactly the way ball and

stick models of chemistry fail to understand fundamental force symmetry-breaking and the paradox between gravity and quantum reality.

There is one and only one avenue I know of to solve this problem. The biosphere has evolved entheogens, which because of the sappy neurotransmitter-based conscious brain, enable us to escape the bubble of perception of organismic consciousness and perceive non-ordinary disembodied reality in such a way that it asymptotically approaches cosmic consciousness because psychedelics enable an experiential consciousness of the brain operating in neutral, much closer to the brain's own cosmological foundations in the forces of nature themselves, than it can when anchored to (a) organismic experience of the physical world, (b) rational thought processes, which are a product of culture and language and anything but visionary in nature and (c) spiritual and religious doctrinal beliefs.

So I say of Symbiotic Existential Cosmology – **the diversity of life is the wine and entheogens are the bottles** to preserve it from extinction – the immortal process unfolding conscious awareness throughout our generations forever. So it's a really deep echo of the Western sacramental tradition fulfilling itself and carries a sense of visionary revelation. There is no guarantee you can achieve this on the first encounter with psychedelics however. It has taken me a lifetime of entheogenic deep nature meditation to glimpse the totality.

Lao Tsu didn't say the way that can be told is not the countless way for nothing. Once we fall out of the bubble of perception, it is obvious and doesn't need to be stated. We have to make the journey ourselves to know and understand.

*The Tao that can be told is not the countless Tao.
The name that can be named is not the countless name.
The nameless is the beginning of heaven and earth.
The named is the mother of ten thousand things.
Ever desireless, one can see the mystery.
Ever desiring, one can see the manifestations.
These two spring from the same source but differ in name;
this appears as darkness. Darkness within darkness.
The gate to all mystery. (Laozi, Tao Te Ching)*

I have no self-certainty. I simply exist.

Experior, ergo sum, experimur, ergo sumus. Experimur igitur universum esse.
I experience therefore I am, we experience therefore we are. We experience therefore the universe is!

Here are five features of where your description is inadequate:

- (1) **Subjective conscious volition is physically creative.** This means the interaction also involves subjective consciousness affecting matter. We also know physical circumstances affect consciousness, so it's a two way street. However we can't describe it as a simple bijective or deterministic mapping, because the dynamics of subjective consciousness, particularly coupled to the brain in organismic consciousness are at the complex end of cosmological phenomena and of any theoretical description, just as I said about ball and stick chemistry versus fundamental symmetry-breaking.
- (2) **Subjective consciousness can't be decomposed or observed, only experienced,** so we can't analyse it, we can only experience it as a whole in all its depths and features and live it to the hilt in the vision quest. Carpe diem!
- (3) **The dynamical relationship between subjective and objective is maximally asymmetric** and has to be so to provide conscious anticipation, complementing brain function for living organisms to survive. Conscious states have to be able to respond faithfully to the brain's boundary conditions, so primitive subjectivity has to be compliant to physics except in situations of physical uncertainty, where free will intervenes without causal conflict.
- (4) **Cosmic consciousness is the cumulative end-result of emergence.** Because consciousness is a two-phase process the first universal and the second emergent we can't talk about cosmic consciousness as if it is the same thing as primitive subjectivity, which exists for single quanta, butterfly effect systems and all life forms. What actually happens is that cosmic consciousness is the most ultimately emergent phenomenon the universe produces. How we can experience it is asymptotically, as highly evolved conscious organisms, releasing ourselves from organismic sensory constraints through meditation enhanced symbiotically through entheogens. This doesn't invoke primitive cosmic consciousness as a universal but forms of organismic consciousness asymptotically convergent to what Aurobindo called the "super-mind" – organismic consciousness becoming one with its most cosmological dynamics.
- (5) **Because this involves annihilation of ego, it involves annihilation of self-certainty.** Only by this annihilation of the organismic filter imposed by the brain can the brain and mind enter into moksha which is the escape from the round of birth and death through the nierika portal to the spirit world (so called).

SEC adds one and only one additional principle to quantum cosmology:

(1) Subjective consciousness is primary.

Thus it adds primitive subjectivity, which is an additional aspect of quantum reality in which subjective consciousness is represented in the global wave function and free will in wave reduction and other natural phenomena reflecting this principle in quantum reality. In turn, this limits conscious decision making to be uncertain dynamical situations in the brain linked to environmental uncertainty. It doesn't assert defining properties, because these have to be optimally compliant with physical reality to avoid causal conflict.

It then makes a second affirmation through subjective empirical experience:

(2) Subjective conscious volition has efficacy over the physical universe.

This resolves the hard problem of consciousness and the problem of free will by reversing the Occam's razor logic, by saying the hard problem is in conflict with immediate conscious experience in a way we can immediately verify (e.g. your reply to me manifests physical effect of your admitted subjective consciousness). You need to understand that this is the simple direct satori that emerged from meeting Brahman on mushrooms, as well as the symbiotic principle.

The third principle is the objective empirical observation that we are mortal biological organisms dependent on physical circumstances:

(3) The universe is necessary.

Key to its scientific basis is the discovery that **attentive sentient consciousness** emerged from the discrete topological transformation accompanying **eucaryote endo-symbiosis**.

Finally, to complete the becoming, the empirical observation of nature:

(4) Cosmic evolution rises to immortal conscious climax through biospheric symbiosis.

The rest of SEC is entirely confluent with neuroscience and quantum cosmology, with no bias, like your cyclic universes have, or which quantum interpretation is favoured by me. SEC supports a filter theory of consciousness in that the brain is and **has to be a contextual filter**, not a materialistically causal determiner of consciousness in the light of (2).

This is a karmic satori in pretty much the same way as Buddha emerging from the sheltered life of nobility and discovering death and decay and inventing Buddhism based on the suffering ego, because we are causing a mass extinction of immortal living diversity as we dither.

Symbiotic Existential Cosmology says primal subjectivity is cosmological and attentive consciousness is emergent and biological. I don't see organismic consciousness surviving death because it has lost its contextual filter in the brain and its environmental context, so lacks its organismic encapsulation. However the living impression on mushrooms that the universe is pervaded by eternal conscious beings is experienceable and may be like a conscious engram in the cosmos.

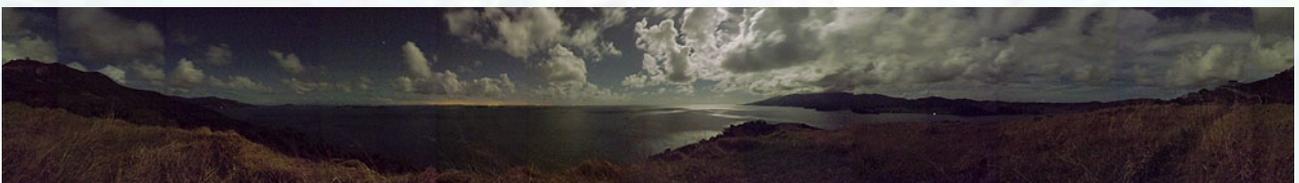

Fig 292: Opuhi - Midnight moonlight. I have spent many moonlit nights lying in entheogenic reverie in the long grass that caps the summits of what is otherwise a wind-swept native forest wilderness.

[Living on the Open Road](#) (mp3 c1985)

Chris King: Song & lyrics, dulcimer, keyboards, ova. **Heath King:** Bass, rhythm and lead guitars, djembes.

We are whispering ... across the heavens
and all the creatures ... they echo in reply.
We are the very blood ... of the tree of life.
We are the void and the shining light.

We are the eternal gypsy spirits of the universe.
We have been here since it all began.
We will outlast its final passing.
We are here to free the heart of man.

Regarding life after physical death, we know the Bardo Thodol deals with this as a kind of transition trip where consciousness undergoes a transmigration of the soul into another body. Thus the Buddhist Lamas I have known,

including the sixteenth Karmapa, were all claimed to be reincarnated beings found and chosen by the Tibetan Buddhist tradition. While I respect the infectious personality of Rangjung Rigpe Dorje, I do have issues with this idea.

We have discussed this before, but I think the idea of the atman surviving physical death is inconsistent with the merging of atman and Brahman which should also occur in maha-samadhi and I hold the Upanishadic tradition to be the source and Buddhism to be a philosophically truncated form of the founding "grail path". You can't on the one hand claim Brahman is "ultimate reality" which is super-abundant cosmic consciousness and then just reduce it to "emptiness" for the purposes of revealing everything is mutually co-arising transient phenomena. I see this as reducing ultimate reality to sandbox spiritual psychology.

So I see the very notion of individual survival of the soul as a heresy. The conscious universe has to be able to return to the source from which all life springs anew, otherwise it becomes cluttered with completed past lives who no longer have a natural context. We/it can't regenerate nature if we are trying to preserve the individual self-consciousness of every atman that has become incarnated in the history of the universe. Neither do I remotely think animal and human souls reincarnate in one another, or that there is any moral law of karma.

This poem gives a hint of this pollution of individual souls:

Missing dates

*It is the Chinese tombs and the slag hills
Usurp the soil, and not the soil retires.
Slowly the poison the whole blood stream fills.
Not to have fire is to be a skin that shrills.
The complete fire is death.
William Empson*

Essentially both the Vedic and Buddhist cosmologies are non self-sustaining, which is why they end in the degradation of the Kali yuga, Samvartakalpa or Eon of dissolution – the decline from enlightenment into ignorance.

Biological life, by contrast, is compassionate of the organismic mortal coil it coexists with, through sexuality being essential for complex conscious animal life to exist. We don't expect individual biological organisms to live forever in the entropic universe that IS Prakṛti speaking and to imagine Puruṣa doing the same thing in individual souls is a corruption of the dew drop slipping into the shining sea.

Every night I go to sleep is a little death, from which I am reborn, but I don't want to be stuck in groundhog day forever. We need to be able to let our selves be the robust but illusory hallucinations they actually are, which can dissolve in moksha to our transfiguration, and accept maha-samadhi as giving back to nature the eternal consciousness we have carried as a flame throughout our mortal lives. That is true compassion.

Dilemmas of Dealing with the Unshakeable Scientism of a Physical Scientist about Understanding Consciousness

This is an account of a debate on the nature of subjective consciousness and the importance of including subjective empirical 1pp experience as well as objective 3pp observation in the scientific discovery process about the conscious mind and the physical brain, so that others can understand the problems consciousness researchers have as scientists seeking to uncover the nature of reality as a whole. I have tried to include as many of the people involved as possible in an account covering (1) 1pp versus 3pp empirical scientific methods, (2) the struggle to validate the nature of subjective conscious volition over the physical universe, which all intentional beings depend on to survive, and (3) the question of observability versus non-observable phenomena. Hopefully this can turn a seemingly intractable divide into a creative process of discovery for readers to come, and shows the problems mainstream science has facing let alone respecting and understanding the nature of subjective conscious existence in the physical universe.

Kashyap Vasavada: As I have been discussing for perhaps a year or so, to me, the most visible demonstration of difference between conscious animals and unconscious rocks is the purposeful moving of body parts. Other things, speech, languages and all esoteric things associated with consciousness come later. To neuroscientists it is now well established that there is some network of nerves starting from cortex or spinal cord and going to limbs using ionic currents. Regardless, the basic model is likely to remain unchanged. Now, how thought or desire to move limbs give rise to currents may be a missing link or under debate in neuroscientific journals or society meetings. But I think the

above model will remain unchanged for quite some time.

Fig 293: Constructing our description of reality based on the external physical world, since Copernicus, carries incredible explanatory power, because nature is complex and provides a detailed physical and biological description, that is accessible to explore, but in terms of subjective experience and conscious existence, relying exclusively on the external objective details paints us into a corner where we cannot solve the hard problem of consciousness, because the external objective description is categorically incapable of modelling or manifesting intrinsic subjectivity. This situation can never be resolved while scientists hold unshakeable fixed opinions, eliminating any first person evidence from the empirical methods of science (experiential and observational).

Jonathan Edwards: We are interested in this ‘missing link’ that gets the outbound events going. The outbound electric events are well understood. Moreover, you can get the same outbound events with unconscious movement, not just brute movement in epilepsy but the finely detailed unconscious movements of my hands going over the computer keys – of which I am only conscious now and again when I think of it. So the debate we are having is where in the chain from input to output is thought and desire. Cathy has her reasons for thinking that something that does not simply follow from (supervene on) electrodynamic patterns is happening – something more. I think we are looking for electrodynamic events of a special sort in nerves. Chris K thinks we are looking for patterns in the dynamics that go beyond individual nerves and beyond the predictability of basic field theory.

Kashyap: So far I have not heard any convincing argument that we should believe in 1pp experience of any one, even Samadhi, vs 3pp verification of thousands of observers which result into certain things like internet we are using now! How can you prove that they are not either honest hallucinations or worse frauds like many I have seen in India? I was discussing tremendous advance in neuroscience about understanding limbs motion and other aspects of brain. They come from precise knowledge of how nerve currents start from specific areas of brain resulting in contraction of specific muscles. This kind of knowledge results in engineers devising prosthetic limbs and brain surgeons putting implants to cure Parkinson’s and similar diseases. You have to know which part of brain does what to put the implant properly. Just saying consciousness makes your limbs move does not mean anything.

Chris: Two articles appeared today in Nature on state of the art implants, allowing a person paralysed by a brain stem haemorrhage to “speak”. It is simply an electrocorticogram grid sitting over the Sylvian fissure, including the motor cortex. This enables the team to build up a primitive representation of the local regional field activation which then has to be carefully decoded as a very rough description of what she might have been trying to say with currently about 72% inaccuracy. It’s locally more detailed than a current EEG but the 253 electrode set is only a little higher than the 129 electrode cap we have used for EEG studies. Of course the techniques will improve, but there is no way this, which does require a deep learning model, or any other mechanistic device attached through a data interface can prove that the subjective conscious volition to speak or do anything else in the physical universe is a simple physical reflex arc, just as there is no way to prove that the physical universe, or its brain dynamics, is causally closed.

Daniel Levine: The problems of understanding the mind, consciousness, behavior, empathy, etc., are so incredibly complex that NO LINE OF INQUIRY SHOULD BE EXCLUDED! 3pp experimental science, mathematical theory, 1pp subjective experience, clinical observations, all are part of the search for understanding. And everybody has a mind and consciousness and behaves and feels, so has contributions to make regardless of station in life.

Kashyap: If you can convert 1pp experience into 3pp data then many observers can participate. That is fine. Then only it becomes science. On our campus many psychologists do EEG/fMRI of mice. My dispute with some on these forums was that they want science to take 1pp experience as scientific data!!

Jo Edwards: You may never get to see your mistake but you are completely wrong about 1pp data not being useful in science. (In fact 1pp is never converted to 3pp, we just establish reliable correlations.) In biomedicine we routinely study 1pp phenomena like colour perception, pain, fatigue, memory (very easily given numerical values) and so on. Just because you have been living in a physics lab all your life does not mean that science not go further outside! And when it comes to basic physics we find ourselves back at 1pp because we want to be able to create a mental picture of

what events in the world are like at a fundamental level. Lots of people end up with absurd ideas like 'wavicles' that don't really mean anything. Others 'shut up and calculate' which is all very well but it means that nobody is likely to make the sort of conceptual breakthrough that Einstein and Bohr did in establishing the quantal nature of reality. Sticking to 3pp ensures that all you ever do is engineering, not even new fundamental physics. To get new insights you need to have 1pp conceptions.

Kashyap: I still stand by my statements. 1pp experiences are useful for psychologists and medical doctors to understand status of a person's brain. But because of vagueness, they are useless for understanding laws of nature! I think every scientist who has at least 10 or more years of college level study of science related subjects would agree with that. The success of physics/science in last 400 years is a solid proof of that!

Jo: You seem to have backed yourself into a corner with no exit, Kashyap. You want to know how desire, which is purely 1pp, gives rise to current, which is purely 3pp, using an explanation that only deals with 3pp. You could equally reverse it and ask how current gives rise to desire. Either you think this is a scientific question or you don't. You do not really have a third option. Consciousness is 1pp. Why join a forum if you think there is no point in theories involving 1pp?

Kashyap: Unfortunately, very many people on these forums do not understand what is science and what are its methods. They keep on arguing, something must be true because it is in ancient books or some one said it! This is false. MSP does not believe in physics because Einstein or Schrodinger or Heisenberg said it!! But many of the things have a solid experimental support! 3pp verification by lots of observers, preferably with repeatedly calibrated instruments, is the final authority in science. Individual experiences cannot be accepted as science. Also theories or models in science have only a tentative acceptance. So, what can you do if it is not possible to do experiments on something like concept of mind, OBE, NDE, psi, afterlife, existence of another world etc. Well these have to be classified as nonscientific beliefs until they are established. You can do experiments on brain. So that is part of science, not mind!

Siegfried Bleher: A single 1 pp experience need not be repeated to grow into a new theory that eventually supersedes its predecessor. If it does, it does so with numerous instances of 3 pp support, as you say. But all of that can be triggered by a single insight in one individual. That is part of the value of 1 pp -- of course, not to deny the tremendous effort needed to bring an insight to public awareness and verification.

Kashyap: Surely, I did not take any neuroscience course. But from what I have read, I can tell that they usually talk about brain. They know that mind is an undefined object. If you find, any neuroscientist talking about mind, what it is and where it is located, let me know. I would like to know how he/she found out about it!! As I said the word 'mind' is coined by some philosopher thousands of years back without knowing much science. Scientists do not talk about unobservable things!

Cathy Reason: How do you know this when you have not taken any course on neuroscience? Undecidable does not necessarily mean unknowable. It just means there is no finite sequence of instructions which will determine if something is mind or not-mind. The same is true of life.

Chris King: Mind is NOT invented thousands of years ago by some ignorant philosopher, it originates from the Norse "love"⁹⁷.

It is shared across cultures by the Latin word "*mens*" for mental. The span of the definitions below shows it is an integral conceptual working component of human knowledge, which is also widely accepted in neuroscience for active conscious mental states, including cognition and reasoning. It is not a physical attribute in space time, but neither is love or the patience so many people have shown you with no commensurate respect from you. Does patience exist in space-time? Does integrity? Does time itself, or is it next for the grim reaper? I believe you do know how to think so you need to respect that your mind thought these delusions of yours. Please stop denigrating psychology and several other sciences and listen to the wide spectrum of objections you have received.

⁹⁷ **mind (n.)** "that which feels, wills, and thinks; the intellect," late 12c., *mynd*, from Old English *gemynd* "memory, remembrance; state of being remembered; thought, purpose; conscious mind, intellect, intention," Proto-Germanic **ga-mundiz* (source also of Gothic *muns* "thought," *munan* "to think;" Old Norse *minni* "mind;" German *Minne* (archaic) "love," originally "memory, loving memory").

Kashyap: [The] only thing I want these people to admit in plain English [is] that they do not know what is mind and where it is. Whether it is undecidable or unknowable like concept of God comes later!!! ... As I said I do not have any problem if someone wants to study it. But do not call it science!! Let scientists define what is science just as we let carpenters define what is carpentry and do not consult carpenters about heart problems!!!

In view of existence of hallucinations, illusions and faulty judgements of individual minds, how can you justify believing in experiences of individuals and ignoring average of measurements based on repeatedly calibrated instruments by thousands of observers all over the world? As I have been saying even judicial system has been relying more and more on video evidence in comparison with accounts of individuals on what happened in front of their eyes!!

Chris: Science is the empirical, theoretical and descriptive discovery of nature. It is not just about $\sigma 5$ quantitative statistical measurements. Empiricism is about both empirical 3pp observation and empirical 1 pp experience. The notion derives from a doctor using their first person experience of medical conditions to make expert diagnoses. Sigma \times simply gives the unlikelihood of the result, whether 1pp experience or 3pp observation, happening by chance.

Gaussian statistics is useful only in fine quantitative measurements of effects with statistical sampling errors. Even then, there is no absolute standard. Statistical methods can be applied to subjective reports, just as with experimental observations and many neuroscience experiments combine both, as Dan pointed out to gain an understanding of conscious brain states. The standards are chosen by the discipline to be appropriate for the circumstances, from $\sigma 1.64$ (5%) in psychology to $\sigma 5$ ($\sim 10^{-7}$) in physics. The fact that I have to tell you this after a year of your determined obstinacy speaks volumes about your inability to understand, or respect, the full sweep of the scientific method.

You are taking such a severe line about empirical methods of investigation that it disables a good sector of physics, let alone virtually all of the biological sciences, psychology, and much of medical science, where descriptive awareness of fine details of a condition are essential. You simply don't make a five sigma medical diagnosis, the balance of personal experience is the key to an effective diagnosis and therapy. The legal system continues to depend on personal testimony, although supported by circumstantial evidence, and must needs do so for humans to take personal responsibility for their intentional actions upon others in the physical universe.

We do NOT let carpenters define what is carpentry. I have built two houses as well as being a scientist. Neither do scientists alone, nor professors, nor Nobel prize winners have the exclusive authority to define what is science, nor should they be allowed to do so. That is called priesthood, religion, dogma or doctrine. You are trying to claim everyone else is ignorant and no one is a 'scientist' as if it was a sovereign title given the elect to rule over others. The worship of higher authority is contrary to the scientific method.

Joshua Davis (Yeshua ben David): Never forget that dead brains in museums are nonconscious systems, like rocks. You will likely never find the memories of the human in a dead brain. I see my mind every day. I also hear an output of your mind when you speak to me as well as when I read such outputs. Perhaps, one day you will change your mind about mind when new meanings surprise you. I am sure you will never need to change your brain to change your mind.

Kashyap: OK! But that brain in [the] museum was alive once. Have you seen a mind anywhere? Can you be sure it is not just your imagination, like child's imagination of 100 ft tall monster under the bed?

Grant Gillett: My mind is contributed to by Aristotle, Aquinas, Locke, Kant, Merleau-Ponty, Vygotsky, Wittgenstein and Luria daily but my brain has never been in the same ecosphere as them – interesting!

Kashyap: All the people you have quoted are dead philosophers not scientists whose theories have to be verified by experiments. In particular Aristotle's physics was completely wrong!

Cathy: I should add, Kashyap, that your questions do have answers, just not the sort of answers you may be expecting – which is presumably why Yeshua and Grant are offering you what are in effect, koans. The answer to your question "Where is mind?" is that it is probably not located in physical space-time at all

Nancy du Tertre: Kashyap, are you starting to get it yet? To Cathy's characterization of Joshua and Grant's statements/ drawings as "koans". Do you understand simultaneous logical illogic or illogical logic – take your pick? A mind "is" where in time and space? Nowhere, somewhere, and everywhere.

Kashyap: Cathy, Sorry to be blunt! Yeshua does not have any Physics degree as far as know, although he is trying to do experiments [on Bell entanglement] in the Auckland Physics Dept. Apparently Grant has M.D. but his answers do not look scientific. My question was a serious one. Grant gives some abstract philosophical answer. Yeshua shows a sketch of his smiling face as representing mind!!! This confirms my suspicion that no one understands what is mind and where it is. Most likely some thoughts arising from brain are called mind, which is a word coined by philosophers and not scientists. In fact, I assert that there are extremely few scientists on these forums. That is a big problem!!! ... You will agree that showing a sketch of human face is not much of an answer to the question what is mind and where it is."

Sungchul Ji: Joshua's answer [a smiling face] was a semiotically profound answer. I am afraid Joshua threw pearls to pigs.

Kashyap: To you!!! You have practically zero knowledge of physics!

Cathy: As far as I know, Yeshua is a physicist and Grant is a neurosurgeon. I'd have thought that was scientific enough for anyone.

Grant: You are right in the sense that I have only published a few books on neuroscience and usually in relation to philosophy; it is similar with my several hundred medical publications. But after all us so called 'doctors' sometimes even have PhD's far less D.Phils.

Amit Aurora: Kashyap ji, I could also say, You know little of Biology or Quantum Physics and technologies, or what lies beyond our universe. Why do you just keep on bombing everybody with their limited knowledge of Physics? I don't believe traditional physics will survive any more as science is advancing at a very fast pace. You need to recognize that physics is just one piece of the broader scientific puzzle. While it lays the groundwork for understanding the universe's fundamental laws, the rich tapestry of science encompasses many other branches, each with its own significance and relevance to our exploration and comprehension of the natural world. Embracing the diversity of scientific disciplines allows us to gain a more comprehensive and nuanced understanding of our complex and interconnected universe. Please you need to change yourself and be open to other people thinking. Please try to adopt a Trans-disciplinary mindset, otherwise you will keep on arguing and accusing people if they know physics well or not.

Sungchul: It would be a miracle if our dear Kashyap listen to your loving advice.

Deepak Chopra: Without the unobservable observer there is no science (Chopra & Kafatos 2017). The empirical manifest is a blip of experience in the vast ocean of formless awareness. "Empirical fact" is a name given by humans to a specific snapshot of perceptual activity in consciousness - a v practical magical lie – in the model of naive local realism - basis of all science.

Chris: Darwin didn't need to do $\sigma 5$ quantitative stats because his discoveries were a descriptive analysis of evolution. Einstein didn't need to do $\sigma 5$ 3pp observation to deduce relativity theoretically or to discover quantum reality experimentally in the photoelectric effect, because it depended only on the frequency, not the intensity (Arons & Peppard 1965). Superconductivity is an effect demonstrated by a permanent magnet hovering over the superconducting medium. It is again a definitive result.

If we want to move forward, I suggest two key steps:

- (1) Agreeing to care for one another and take shared responsibility for any outcome and not presume to ignore valid critiques from group members, as Kashyap does.
- (2) Figuring out how the group can actually further, or accomplish, the repair of the world – tikkun olam. This is the urgent key that gives the group meaning and purpose.

Brian Josephson: My PhD was experimental (title: 'nonlinear conduction in superconductors'), but I did do a little theory on the side, including a published paper that went down well.

Chris: Brian was awarded half the 1973 Nobel prize "for his theoretical predictions of the properties of a supercurrent through a tunnel barrier, in particular those phenomena which are generally known as the Josephson effects". Wikipedia notes that he has repeatedly criticized "science by consensus," arguing that the scientific community is too

quick to reject certain kinds of ideas. "Anything goes among the physics community – cosmic wormholes, time travel," he argues, "just so long as it keeps its distance from anything mystical or New Age-ish." Referring to this position as "pathological disbelief".

Daniel: If you rest your case, [Kashyap] please rest it! I am tired of hearing it over a hundred times, and repeating it to this group will not change anyone's mind. As for my "Type 2 publications," to me the connections are seamless not only between science and spirituality but between science and the humanities and social sciences. So I have written articles that are expository for varied audiences, drawing on my scientific research and others', both in scientific journals – like Neural Networks, Cognitive Systems Research, and European Journal of Medicine – and in non-scientific journals – like Journal of Socio-Economics, Utopian Studies, and Interdisciplinary Journal of Partnership Studies.

Siegfried: I will say that it is likely the brain acts as an anchor and receptor to the mind, in the sense that our feelings and concepts serve to delimit our patterns of thought and access to original thoughts and concepts. Such limitations include concepts of locality and identity. Since we know that patterns of movement and memories can be triggered with electrical signals, there is an additional anchoring to the physical processes identified by neuroscience. But I don't think neuroscience will find the mind within the anchors.

Entheogens and meditative practices disrupt the anchors, which leads to revelations of the unanchored aspects of mind (which, of course, can be both good and bad, depending on preparation of the individual and the availability of guidance), or switch the mind to a different set of anchors.

The way mind can be 'outside' or 'prior to' location and still have agency on the physical without appearing to violate any physical laws is if what is describable physically is finely balanced at a critical point. The evidence for the presence of mind is in the intelligence present in the trajectory over time, not in violation of conservation laws in any single event.

A way of linking what I am describing as the mind separate from the anchors to physical anchors is to recognize that there is self-consistency in 3pp science as determined by contextual constraints of the current conceptual foundations of MSP. As I mentioned in an earlier post, the conceptual foundations of MSP rest on perturbative properties of QFT near to and at the extrema of the actions for the current model Lagrangians. There is a kind of confirmation bias that prevents MSP from considering non-perturbative aspects of the model Lagrangians or more accurately other Lagrangians whose perturbative limits we work with that might contain more distant extrema (locatable with Floer homology, for example).

Kashyap: To give a short answer people who investigate unobservable things are not called scientists in the usual sense of the word. So there is no question of any boundary!! If you do not believe me, go to a nearby university and talk to a professor who is spending his/her life in teaching and research in science. Note that there are indirectly observable things like quarks or wave functions. But NO SCIENTIST, yes, NO SCIENTIST will ever say he/she would like to spend his life in trying to investigate strictly unobservable things!!! So there is no type 2 science. Either it is type 1 or something else which should not be called science!

Chris: The only scientific concepts that are definitively unobservable are sub-quantum hidden-variable theories that coincide with quantum field theory at the quantum level. In addition there is only the concept of an invisible omniscient omnipotent God which is, to say the least, scientifically problematic. This is really really important to get right. I "believe" there are hidden variable theories that are (1) consistent with pilot waves in terms of weak quantum measurement, (2) with the transactional interpretation in terms of wave function collapse and (3) with super-determinism in its dynamic detector boundary conditions. I think this is how the universe is and that's why it is alive as Deepak says and we are alive, so the idea that this investigation is not science or not scientific, is itself completely unscientific.

But I don't agree about the existence of an unobservable spirituality either. The whole 1pp vision quest is the complement of the 3pp physically observable world. Both are by definition observable. The journey of the vision quest is both the ferry across the Styx and the voyage of the Beagle in paradise. The mystery is transcendent but the reality is immanently manifest. I am an empiricist and a mainstream scientist on the question of observability. I don't accept any form of unobservable moksha or an unobservable cosmic mind. The whole basis of Brahman as ultimate reality is its transparent experientiability, no longer through a glass darkly, but now face to face, knowing also as we are known.

Bearing in mind the vast differences between these points of view and their cosmological significance I think any premature conclusions are precipitate.

Yeshua: Yes Chris, I concur that unobservable physical quantities are different than unobservable thoughts and spiritual values. I was referring to unobservable thoughts or spiritual values only to 3 pp science and only available to 1st pp and possibly to 2nd pp science in shared experience. I concur with you that experiences and reports of sublime thoughts and values in meditative or entheogenic states are to be considered as 1st pp empirical science.

Deepak Chopra: On target Chris ! 🙏💕💕

Chris: I am not uncertain about the nature of mind or consciousness. You know I have Symbiotic Existential Cosmology fully fledged, of now 763 pages thanks to this review. I am NOT uncertain about this as a theoretical description. I repeat the key principle which is: "**Subjective consciousness has efficacy of volition over the physical universe**" due to our relationship with quantum uncertainty, manifest in environmental uncertainty in a causally open universe.

We all need now to move on and not look back, or those that remain will turn into pillars of salt, or suffer the fate of Eurydice through the uncertainty of Orpheus, to coin a myth that Kashyap may yet come to understand.

Dilemmas of Dealing with the Unshakeable Idealism about Cosmological Consciousness

Deepak Chopra: Matter is a name for human perceptual activity. Useful construct Not fundamentally real. Matter is a collection of qualia in consciousness.

Chris: I think you are dreaming! Or I hope you are! My father was a general surgeon. Who had a dream that he was standing on a very long stairway and on it there was another man and he said to him "This is just a dream and I'm going to put my head on the stair and you can kick me in the face!" So he did just that, and the man kicked him in the face and he awoke in shock in agony with pain, just as real as if he was awake.

Now if you think that when you said "Matter is a collection of qualia in consciousness", which I presume was when you were in a state of alert wakeful consciousness, as you sent this electronic communication to us, how about you put your head on the stair while you are awake and one of us can have a go to give you a gentle jab. If we went too far, you would lose this consciousness, as you know as a medical practitioner. So you are either going to be in abject pain and possibly bleeding, or you will be unconscious and won't have these "qualia" you claim is the physical universe. But for us, the universe is still around us and you are out cold on the stairway.

We all know this and so we just about all know you are fooling yourself. As the old saying goes, you can fool some of the people some of the time, but you can't fool all of the people any of the time, nor any of the people all of the time. You certainly can't fool me, although I don't believe matter makes mind either, but if you intend to continue to try to pull the wool over my eyes, please let's just run the experiment together on zoom for the whole world to see, recorded in its full glory!

Deepak: Your head is also the same illusion. As is your body. As is the pain. As is death. Awareness is independent of its modified expressions. Bye.

Chris: I wear a Tibetan silver skull on my necklace with a 1/4 Anna coin as the clasp, now nearly dissolved by years of sweat, that was thrown to me by a priest in a little roadside temple in Puri where the juggernaut from Jaggernath crushed the faithful under it's wheels. But none of this mind illusion talk has any power to save the Tree of Life throughout the universe!! Neither does running for the door express confidence in your assertion!

Deepak: All names and forms are ephemeral transient identities. Even yesterday is now an ephemeral dream. Why can't we realize all names and forms are human constructs attempting to explain transient experiences in awareness ?

Chris: Transcience is the unbounded mother of living diversity. The sorts of native or naive observations you make, we can make from the age of four, summed up in the same words because consciousness is where we start. But like it or lump it, we are here to transform the living universe, each in our own microcosmic way for better or worse. Stepping off the merry go round is what death actually is. Don't preempt the grim reaper! Don't cast lots on its garments before your time! You are just hastening the inevitable!

Deepak: Chris is a genius

Deepak: Fundamental reality (existence) is formless. It has no borders. It is infinite. It is the immeasurable potential of all that was, all that is, and all that will be. It is Absolute Irreducible Shapeless Timeless Unchanging Unimaginable Incomprehensible. It appears as every changing form and phenomena. All forms are actually phenomena. The phenomena are in turn constantly changing fluctuations of the formless Absolute. The Absolute is changeless. The relative (fluctuations) is ever-changing. The Absolute is of the nature of consciousness (awareness). The Absolute is Self-aware. Its fluctuations are in the nature of species-specific experience. The species themselves are diverse forms (fluctuations) of awareness. The evolving universe is the changing appearances of Absolute awareness (species-specific). As humans with a narrow band of perceptual activity (now expanding that range with scientific instruments) we experience only a sliver of Reality. Anything perceivable or conceivable is ultimately not real (transient, ephemeral, and momentary). The cause or reason for existence is a Mystery beyond human comprehension. At the Source, we are the mystery we are seeking to explore.

Chris: The diablo is in how Neti-Neti is applied. You are trying to apply it to all forms of experience as illusion, but it means neither subjectivity nor physicality is absolute. In the Beatles' Yellow Submarine there was a personified vacuum cleaner that sucked up everything, just as you do, but you never got to the finish line where the vacuum cleaner turns on itself and sucks itself to oblivion up its fundamental orifice. You are clearly conceptualising everything but the kitchen sink, but then you declare this emptiness Absolute and that's a concept too, so the argument disappears up its fundamental orifice. I think the Absolute lies in the complementarity which is itself a paradox we can consciously experience. To say experience is illusion and consciousness is absolute is contradictory because consciousness is also in its most astute awareness, fully conscious of itself in its experience and in my view is most conscious of itself in the flow of self-aware conscious experience that is manifesting form creatively.

Ram: Brahman is neither mental nor physical (using the neti-neti principle), so it is consistent with Neutral Monism (Vaidya, 2020).

Chris: The Brihadaranyaka Upanishad, that cites both "I AM Brahman" identifying subjective experience with ultimate reality and Neti-Neti "not this not that", states there are two forms of Brahman, the material and the immaterial, the solid and the fluid, the Sat 'being' and tya, 'that' of Satya – which means true, denies the existence of everything other than Brahman. It doesn't say manifest Brahman originates from unmanifest. The diablo is in how Neti-Neti is applied. You are attempting to classify Brahman by a false Neti-Neti. You have neither physical evidence nor experiential evidence. I now simply retort "Neutral monism – Neti-Neti" to refute it, because you are not talking about Brahman, but the philosophical concept. You have no personal knowledge of Brahman and yet you have the cheek to satisfy your predilection to allot Brahman into a category by remote control. It is a contradiction to say Brahman is neither capable of manifesting physically nor mentally. The entire Upanishads revolve on the awareness that atman can experientially merge with Brahman. That's the redemption of the Vedas! In my moksha my brain was functioning physically free of the sensory limitations Deepak points out and my conscious experience was union with Brahman in an NDE. Ultimate reality manifests in ALL aspects and then results in 824 pages of SEC to manifest both irrevocably.

You are simply picking Nirguna rather than Saguna Brahman to suit your neutral monist theory. We already know about abstract Brahman versus personified the Ishvara/Ishvari 'Elohim'. Nirguna and Saguna are philosophical aspects of each with their own conceptual rationalisations. Brahman is BOTH abstract ultimate reality AND a compassionate persona very concerned for the future of cosmic consciousness in the natural universe. This is NOT a false vision because cosmic consciousness depends on the existence of biological life.

Deepak's description is a product of sparse contentless meditation that ends up perceiving consciousness itself as the Absolute, while nothing insightful is forthcoming. Yes, consciousness is behind every experience and is that which is

aware of everything but that doesn't mean it is the Absolute. There is no explanatory power in this description except its claim that everything comes from consciousness itself. But this simply cannot be consciously established because we are inside the bubble of perception. The only way to get out is experienceable moksha, but you can't do that with emptiness meditation. You need a fully experienceable NDE that transforms your world view and provokes you to act to save life throughout the universe. Anything less IS delusion. Psychedelic deep meditation is the complete opposite of this, full to overflowing abundance – and is the incarnate natural route to moksha. Emptiness meditation is a very sparse confining form of samadhi. Seriously at fault is the complete failure to understand how anything happens or why it happens in the way it does. We can't explain the relationship between experiences and the world around us. We can't explain biology, why we are alive, or any other aspect of reality except to say it is all illusion.

Deepak: Do you have any idea why there is existence? Or why there is aware[ness] of existence? Do you believe that systems of human thought including science or philosophy have access to reality? Do you know the source of thought? Have you ever questioned the limitations of human knowing? Why do you assume that a species on a speck of dust in the junkyard of infinity among 2 trillion galaxies has access to Truth?

Chris: Existence exists to experience with no limitations. It's not about thought, or rational discourse, which are superstructural logical forms of conscious experience but unconditioned experience, able to adopt any form. The diversity of existence is the jewel of life incarnate, not a junkyard. The certainty of knowing transcends the illusion of "Truth".

Ram: The question is how Sagun Brahman manifested from Nirgun Brahman. Is it through evolution and natural selection? Yes, it might be true because life arose 10 Bya after the Big Bang. For 10 Bya, Nirgun Brahman manifested into non-living entities such as galaxies, stars, planets, etc. When humans came, Nirgun Brahman manifested into Sagun Brahman, such as Ishvara/God and deities, which were needed to organize us, live peacefully, reduce suffering, and solace when our loved one died. It makes sense to me to bring science and spirituality closer. What do you say?

Chris: I don't think Sagun is just a manifestation of Nirgun. They are both perspectives on an unconstrainable reality. The Vedas were conceived through samadhi from the idealistic perspective that emerged from animism and spans both East and West. Their rationale is thus conceived idealistically as thought, or consciousness. It's inherently subjective, not neutral.

When you say manifesting into "non-living entities such as galaxies, stars, planets, etc" this is assuming two things:

- (1) **That these are non-living.** While I see biological life as cosmologically climactic, because it is the most complete manifestation of the four forces of the core standard model, the answer to all this is that cosmological Gaia is plausible on all levels once we have primal subjectivity, so the primal paradigm is fertile.
- (2) **Whether there is an abstract symmetry-broken force of nature at the source or whether it needed an aphysical "agent".** All the events since the inflationary big bang are consequences of this early phase following the known symmetry broken laws of nature. The jury is still out for lunch on the early pre-inflationary phase and whether it needs primal subjectivity or "God" or us anthropically to define it, or is a one of many multiverse. In every other respect outside quantum uncertainty, the subjectivity is complaint to physical boundary conditions avoiding causal conflict, although the inflationary origin was likely a quantum uncertain fluctuation. So I suspect Brahman manifests initially as primal subjectivity and ramifies late in cosmic history, with organismic consciousness, so the cosmos can become self aware, pulling itself up from its bootstraps so to speak using the forces of nature to become incarnately embodied in the biota.

Ram: Where does primal subjectivity come from?

Chris: From the necessity for the subjective to exist at the origin because material complexity does not explain subjectivity. It doesn't mean subjective and objective can't interact, as Ryle claimed, as we actually experience this all the time, but one cannot be used to explain or invoke the other, so subjectivity has to be coeval with the cosmic origin. This is exceedingly plausible, because the universe itself arose from a quantum fluctuation in the inflationary scenario and it provides primal complementarity to the primal universe. Then they can both bootstrap interactively together as Shiva-Shakti. And it trounces the hard problem by saying that if physical matter can't generate subjectivity through physical complexity then matter must already have a subjective aspect. It's just like dual aspect monism, but its interactively alive, so subjective conscious can, in turn, affect the material universe. That's the other way it is asserted

– the primal axiom that **subjective conscious volition has efficacy over the physical universe** as an empirical experience, in which both come together existentially in the now. So we are full circle.

Ram: The article by Swami Mehananda is fascinating. It seems the neutral (neither mental nor physical, neither conscious nor non-conscious, neither formless nor with forms, neither attributeless nor with attribute) Nirguṇa Brahman (NB) is the fundamental/ultimate reality.

Chris: You seem to be misquoting Aurobindo and the content of Mehananda's (2022) paper about Sankara as well, so your Nirguna Brahman thesis unravels.

Firstly Aurobindo says:

For in the Inconscient itself and behind the perversions of the Ignorance Divine Consciousness lies concealed and works and must more and more appear, throwing off in the end its disguises. —Sri Aurobindo, Letters on Yoga I.

This clearly says Aurobindo does not accept a neutral monistic idea of aspect-less ultimate reality. It says he sees consciousness as the divine fundamental and neutral Inconscience as simply a substrate for consciousness to manifest and transcend.

Secondly the key reference to Nirguna in Mehananda's (2022) paper says:

According to Sankara's "illusionist" Advaita philosophy, the sole reality is the impersonal and attributeless (nirguna) Pure Consciousness, which only appears to manifest as this world due to our ignorance.

By contrast, according to Aurobindo's "realistic" Advaita, the Divine Saccidananda is both personal (saguna) and impersonal (nirguna): the Sat aspect of Saccidananda corresponds to the impersonal Absolute accepted by Sankara, while the Cit aspect of Saccidananda is "Consciousness-Force," a personal and dynamic "Cit-Sakti" which has the inherent capacity to manifest in and as the world. Hence, Aurobindo, unlike Sankara, holds that everything in the world is an emphatically real manifestation of Divine Consciousness. ... According to Aurobindo, evolution has both an outer and an inner dimension. Darwin's theory of physical evolution through natural selection provides a more or less accurate account of how various species have evolved in the course of the earth's history. However, what Darwin overlooked is the inner spiritual evolution of consciousness through the mechanism not of natural selection but of divine "involution." Divine Consciousness, Aurobindo claims, is "involved" in everything in the universe and progressively manifests itself at each stage of the evolutionary process from matter to life to mind, and ultimately, to Supermind.

Mehananda is saying neither Sankara's "illusionist" philosophy nor Aurobindo's "realistic" approach are neutral monism with no manifest aspects – Sankara because nirguna is not attribute-less but is a form of "consciousness" and Aurobindo because "Consciousness-Force," has the inherent capacity to manifest in and as the world. Deepak also clearly identifies consciousness as fundamental not attribute-less unknowable, neutral, nothingness.

Aurobindo comes closer than Deepak to a comprehensive notion of existence:

These [i.e. Mind, Life, and Matter] are in themselves powers of the superior principles [i.e., Sat, Cit-Sakti, Ananda, and Vijnana]; but wherever they manifest in a separation from their spiritual sources, they undergo as a result a phenomenal lapse into a divided in place of the true undivided existence: this lapse, this separation creates a state of limited knowledge exclusively concentrated on its own limited world-order and oblivious of all that is behind it and of the underlying unity, a state therefore of cosmic and individual Ignorance.

I am certain Deepak is wrong about all experience being illusion, which also justifies Mehananda's term "illusionist" applied to Sankara, but he is right in identifying "consciousness" as primal.

But Aurobindo makes the mistake of seeing matter as aggregates of consciousness:

According to Sri Aurobindo, in conformity with the oldest Indian scriptures, matter was created by the ultimate or supreme consciousness seeking manifestation. In order to manifest, supreme or absolute consciousness, starting from the full fluidity of the spirit, created graded planes of being, till it reached the state of manifesting the solid density of matter. Sri Aurobindo calls this the process of Involution. The involution of consciousness is the process in which the Supreme or Absolute conceals itself more and more by creating planes of consciousness of increased density, in order to create the density needed for physical manifestation. In each of the planes that were created during the involution, (called typical planes or graded worlds) the absolute or divine consciousness veiled itself increasingly till it was able to produce and manifest the various forms of solid matter.

At least this is aiming for an existential cosmology. Symbiotic Existential Cosmology avoids this problem because it conceives of cosmic conscious as a state we approach asymptotically through opening the doors of perception while primal subjectivity is vestigial at the cosmic origin, thus not having to try to explain the physical universe as derived from involutions of consciousness, which we know to be a primarily organismic climax phenomenon in biological evolution.

Ram: Yes, there might be many possibilities; but how can we rule out what I mentioned previously? “When humans came, Nirgun Brahman manifested into Sagun Brahman, such as Ishvara/God and deities ...”

Chris: Before I reply to Ram I want to explain briefly how the relationship between consciousness and experience arises physically in the brain and how this clarifies the nature of existence and the relationship between NB and SB in Symbiotic Existential Cosmology. I am going to discuss the mammalian brain but we need to understand from the outset that all metazoan brains share deep common principles that arose in single celled amoeba-flagellates, despite apparent anatomical differences, exemplified by the apparent REM sleep phases of resting baby spiders.

The mammalian brain is not just a neural network of synaptic connections but utilises phase modulated feedback with tissue field potentials and is in fact a vast symbiotic population of neurons and neuroglia cooperating in an intimately coupled society similar to aggregating social amoebae. It consists of two interacting systems, one arising from the ascending cholinergic reticular activating system evoking the energetic resonances between the thalamic nuclei and the cerebral cortex we associate with active consciousness, in turn, modulated by the adrenergic ascending pathways of serotonin, dopamine and other monoamines modulating brain dynamics for organismic survival.

Complementing this is the envelope of the cerebral cortex, which, with the exception of prefrontal areas involved in attention, is organised as an experiential filter on ascendent activity, in six cortical layers, distributed across the cortex in micro-columns, which despite the extreme variations of visual, auditory and somato-sensory processing, all have a common architecture and physiology. This cortical experiential filter under normal operation eliminates the subterranean level of processing to form a perceptual/experiential internal model of reality spanning all dimensions of subjective experience external and internal. This means that we don't see the physical world of wave particles directly as it is, but an inner representation of it, e.g. through three colour vision based on the versions of rhodopsin in the cones of the retina, augmented by higher level visual processing areas into veridical 3D vision, symphonic spectral audition, alluring olfaction of hundreds of receptor dimensions and subtle tactile through to emotional and internal organismic sensations. Because some areas of the cortex include information about self and other, these also include recursive experiences of autonomous agency over the world around us, distinct from consciousness itself. As well, partly through culture and language, we have developed higher processes of cognition, analytical thought and reason, extending from natural intuition of the environment around us and our relationships with other agents. This internal model of reality, although located biologically in the brain becomes the holy grail of existence, as a kind of controlled hallucination, we call subjective conscious experience.

When we enter deep states of meditation leading to samadhi, the cortical filters become diminished, leading to consciousness becoming liberated from physical perceptual constraints. In addition samadhi leads to a full or partial dissolution of the distinction between self and other when areas of the default mode and related networks key to organismic survival, to do with rehearsing existential survival threats become quietened. This leads to an oceanic view of consciousness connected to both one-pointed concentration, and abandonment of one-self to the greater whole, which may be associated with bliss and with the idea of the formless emptiness of consciousness, but is also associated with the merging of organismic atman with Brahman as ultimate reality beyond form.

There are two additional factors we need to take into account. The first is that human cultural emergence arose from gatherer-hunter society in which other living agents rather than machines constituted the key existential crises in other people, climate predators, storm, fire and flood, so human consciousness has invested in animism, the a priori assumption that the “other” is another conscious agent. As animism became pantheism and then doctrinal religion, these animistic perspectives grew into anthropomorphic deities possessing jealousy, anger, compassion, and other human emotions. These emotional dimensions are also manifest in the default mode representations, so it is possible for the subject in samadhi to either experience ultimate reality in the abstract in the dissolution of experience of form into pure consciousness, or to envisage the merging with Brahman in a fully manifest personality of meeting God. One can see these features physiologically in cingulate cortical areas such as the precuneus, having representations of the emotional personality of both self and other which can become merged in samadhi.

This means NB and SB are different theistic and abstract conscious states accessible to individuals in samadhi which is how Vedanta and Buddhism became traditions. To claim NB is completely inaccessible to consciousness is a contradiction to Brahman being cosmic consciousness and nullifies the basis through which the very concept of Brahman arose in deep samadhi. This also means NB and SB are coexistent depending on how they are experienced at the time, not SB arising cosmologically from NB

The second factor we need to take into account, which is much less familiar to many of you is the advent of visionary sacraments and particularly the classic entheogens. These provide an additional avenue to a very experientially overflowing version of samadhi, in which the very processes producing subjective experience become emergent in consciousness. This provides a full to overflowing visionary condition which is also strongly predisposed to quietening the default mode network, particularly when combined with deep meditation, to make a more experienced form of samadhi, which nevertheless also involves consciousness beyond form and can induce a moksha experience of escaping the mortal coil, the bubble of perception, or bundle of life, in which our incarnate condition is bound, resulting in release from the confines of birth and death into union with cosmic consciousness. Although this is highly sensual, it strongly manifests consciousness not only beyond form, but the generator of all form, both illusion and reality, so it is in a Copernican sense, a privileged view of ultimate reality that can be of immense healing power, although it can also be profoundly distracting without deep meditation.

This leads to an altogether different view of ultimate reality in Symbiotic Existential Cosmology in which Brahman is in the process of becoming manifest in the samadhi states of meditators and in which subjectivity and the universe are complementary and coeval manifestations of reality, from which full consciousness emerged late in the universe in the eucaryote endosymbiosis.

Consequently Brahman is a climax conscious phenomenon in an asymptotic liberation of the confines of organismic consciousness in samadhi-moksha, which is in the process of becoming in us and will continue to do so more fully through the use of entheogenic samadhi-moksha states in a human culture symbiotic with the diversity of life throughout our future generations, rather than committing a destructive Fermi extinction upon ourselves as we are currently doing.

Ram: Individual consciousness is conscious subjective experiences (CSEs) of (a) self-as-subject and self-as-object, (b) exogenous and endogenous stimuli, and (c) conscious components of cognitions such as conscious thoughts, decision-making, and judgment, &c. Each of these CSEs (consciousness) including all types of samadhi-related closed eyes meditation/mystically induced endogenously generated or open eyes meditation and external objects induced CSEs must have its own neural-physical activity/basis (NPA/NPB).

Chris: Your definition is deconstructing consciousness into three inaccurate forms of conscious subjective experience, which is not just self, stimuli and cognition. It is confusing the subjective observer with their observations. This robs identity of its agency. It is necessary to distinguish consciousness from experience to have any understanding of subjective existence. Consciousness is the active process of subjective awareness observing the contents and varied forms of experience. This is why Deepak for all his super-idealistic bias is correct that consciousness is formlessness beyond all the forms of experience. You depersonalise this by objectifying both into NPA (~ consciousness) and NPB (~ experience). But your classification eliminates the ghost of consciousness in the machine of IDAM. You can then extrapolate incorrectly to use NB as a cipher to fill the gap with an inverse null hypothesis that ultimate reality can neither be experienced by consciousness nor comprehended in any way physically nor experientially. When Buddhists say enlightenment is "emptiness" what they are misdescribing is that consciousness is formless awareness beyond all forms of experience, not that it is null. Consciousness has to be like this so as to be able to experience virtually anything and everything possible.

Your definition obliterates active conscious agency by asserting that consciousness is subjective experiences of self and subject and self as object. You have already in your definition turned not only our experiences, but our very selves into mere objects, or features of our observation on the false basis of both being fixed duals of active brain states. This is obliterating the active agency of what conscious existence is.

When I say subjective consciousness has efficacy of volition over the physical universe, it is saying there is an active intentional wilful attentive interaction between subjectivity and the physical universe. Without this, we are no longer

transformative agents over physical reality, as we must be to survive in the wild. The key mystery is in consciousness itself complemented by its private experiences in perception of the physical world, as well as dreams memories samadhi states and deep visionary states of entheogens.

You add to the problem by falsely classifying CSEs with NPA/NPB in a dualistic breakdown that incorrectly attempts to identify physical and subjective states as duals from the micro to the macro. This model is incorrect because the physical universe is fermionically composite particulate, while experience is holistic and it causes you to depersonalise the agency of consciousness into ball and stick categories you can then assemble into a classical "objective" philosophical framework.

You now propose that unmanifest Brahman is the core non-subjective non-physical transcendent reality and that manifest Brahman is derivative and dual aspect. The trouble is also that Nirgun being primary over Sagun is still part of degenerative false cosmology. Idealistic cosmologies start with a super-conscious omnipotent entity, generally of transcendent subjective experience invoking the universe in which we consciously exist. The trouble is spiritual entropy. The superconscious state disintegrates and separates into a plethora of Shiva-Shaktis lost in their organismic survival (ego). Then it ends up in genocide the Kali Yuga, Samvartakalpa, Frashokereti or Eschaton. So everything is running down hill into iniquity. This makes no sense at all. This is a false cosmology because here we are at the climax of biospheric life incarnate having come out of nowhere. So we need to invoke the creative principle that runs uphill to overflowing. It also lead directly to Christ as the sacrificed mediator in the Logos creation cosmology of Philo invoking Golgotha and the Eucharist.

Both Eastern and Western cosmologies show that reliance on an ultimate good abstract or unmanifest creative entity leads to the Fall into degeneracy because the ultimate eternal goodness of the "Godhead" ends up becoming an unbearable contrast to tooth and claw in the mortal coil, in a tragedy of the commons. This dichotomy pervades both Greek and Vedic cosmologies, in which matter and nature become cursed with mortality, betrayal and pain which is attributed to evil and leads to the Kali Yuga. Idealistic inspiration also pursued false moral doctrines, which became infectious social memes, because religion began to seek control over social lives and reproductive choices.

But Brahman as ultimate reality is also the creative principle from which all conscious life springs forth, so Brahman is unbounded by organismic mortality, which is just an evolutionary aspect of biospheric sociobiology. Brahman is indestructibly creative but takes 10 bya to evolve fully conscious manifestation, so Brahman in my moksha is rightly expressing compassion for the fate of a timeless cosmic consciousness caught in the Faustian pact of a humanity hell-bent on destroying itself, from sheer ignorance of the cosmic condition. That's why Symbiotic Existential Cosmology reverses and inverts the entire sequence. Deepak is right that we are in Shakti's graveyard, the junk pile at the end of the universe unless we wake up, but that's all that is required!

The second problem is that Nirguna Brahman is a completely unmanifest entity which is neither empirical by experience nor by experiment, so it reduces to an a priori belief and remains unestablished unless and until there is some indirect manifesting evidence for its existence. This is the same problem in cosmology as asking what preceded the Big Bang. We can imagine brane worlds and cyclic universes or that God created Eden, but we can't afford to opt for a model of cosmology that ends in apocalyptic disaster to appease our own desires. I am asserting that since full cosmic conscious Logos cosmology – creation by cosmic conscious pronouncement – is fundamentally degenerative of existence, it is a false invention of the human psyche, reasoning essentially from idealism of the perfect mind, in abject horror at the tragedy of the ephemeral world of the mortal coil, which we must needs accept and redeem.

SEC poses primal subjectivity. This is the minimal axiom added to ensure subjectivity is present at the cosmic origin. Primal subjectivity covers all notions of subjective reality outside full eucaryote consciousness and conscious experience, so it retains empirical integrity. All the evidence we have says that subjective volition can be efficacious only in causally uncertain situations, or causal conflict would arise. Thus primal subjectivity has to be fully compliant with physically-defined boundary conditions. The answer to the manifestaton question question is evolution itself and the quantum uncertainty of mutational change, given the molecular boundary conditions and selection forces.

Your notion that there is an inscrutable formless null-aspect Brahman hovering over the early universe, like the Father God of Philo, is in contradiction to achievable manifestation. Prior to the eucaryote endosymbiosis the only physical avenues for primal pre-conscious subjectivity to manifest were broadly speaking in quantum uncertain and butterfly effect Gaia systems in nature. Quanta have individual "free will" only within uncertainty and uncertain events, storms

and Gaia effects likewise. Therefore to claim an all powerful fully formed but aspect-less Brahman orchestrating consciousness has no vehicle, no evidence.

The tradition says that formless Brahman is ultimate reality and manifest is personified as 'Elohim Ishvara/Ishvari'. The former is mystical visionary and the latter religious, leading to two traditions. Advaita (Nondualist) school of Vedānta sees Saguna merely as a preparatory aid to meditation but theistic schools of Vedānta (Viśiṣṭādvaita), argue that God (Brahman) is possessed of all perfections and that the scriptural passages denying qualities deny only imperfect ones. I experienced both, ultimate reality and Brahman as persona, so I see formless Brahman as unrestrained consciousness, when full consciousness as we know it has no sensory boundary conditions. Griffiths et al. (2019) compared "God-encounter experiences" under classic psychedelics and naturally. While "the Non-Drug Group was most likely to choose "God" as the best descriptor of that which was encountered while the psychedelic groups were most likely to choose "Ultimate Reality." Karen Armstrong notes that Brahman emerged from Vedic *Rta*, the principle of natural, moral and sacrificial order in the cosmos. *Rta* and the Avestan equivalent *aša* both derive from Proto-Indo-Iranian **H₂rtās* "truth". Karen Armstrong points out that Brahman was the outstanding insight of Vedic understanding, allowing a direct experiential appreciation of "ultimate reality", transcending personalised divinity.

There is no evidence a neutral non-manifest substrate can manifest as either subjective or objective because it then has to violate categorial inconsistency. There is absolutely no way to justify this or make any kind of reality check. Furthermore consciousness itself IS the hypothetical formless substrate and it can be and is experienced.

Deepak: Repeating myself. All theories of consciousness are inferential explorations of consciousness in consciousness. Only consciousness can be conscious. Direct experience of consciousness is Self Awareness without theories. It does not need scientific or philosophical explanations. Science and philosophy are human mental activities in consciousness! Consciousness is acausal and everything else is its activity. Existence is awareness of existence. No theory needed.

Chris: Deepak is broadly correct that Brahman is consciousness itself. This is where the dialogue begins and the Upanishadic tradition continues and it arises from deep samadhi where subjective conscious experience is all there is. To say this has null aspect is the fundamental error of Atmanspacher (2012), which becomes a ghost, not only in the machine, but also of consciousness itself.

To break the cycle, we HAVE to undo this madness by accepting that we are, although mortal, part of the immortal web of life as the conscious universal climax, invested with the creative divine principle and the interaction of subjective consciousness and the physical universe is real and the personal responsibility that we inherit as manifestations requires us to undertake to save life throughout the universe from precipitate annihilation. That's what Symbiotic Existential Cosmology is here to do. Nirguna Brahman is not intended to be the ultimate reality over Saguna Brahman – they are alternative views of one entity and they are free choices of the conscious beholder. We need to take personal responsibility for being at the centre of the cyclone and playing that good part in cosmic redemption, not relying on comforting delusions which turn out bad for us all, the world and life as a whole.

Subjective Physical Interactivity as the Source and Cause of Conscious Biological Life

(1) Categorical Interaction of subjective consciousness (s) and physical reality (p)

Interactivity between subjective consciousness and physical reality is a natural process. In terms of an *s-p* category error that Gilbert Ryle expressed in terms of verbal formulations, the categorical inconsistency of *s* and *p* is an illusion. In the conscious interactive context:

(a) There is **only one overall subjective s state** involved, namely the entire stream of conscious intentionality corresponding to the conscious subject's unfolding subjective experience.

(b) There is **only one physical state** in this interaction, which is the integrated climax state of the ongoing causally uncertain brain dynamic.

These are **dynamically coupled as whole s and p states without any category error**, because the climax *p* state is as wholistic as the *s* state through its coherence as a conscious brain state.

The *s* and *p* states can thus readily interact. There is no causal conflict, because subjective consciousness perturbs only the physically uncertain aspects of the whole brain state, but neither *s* nor *p* categories are complete, nor causally

closed because, as complements, the totality requires both, so their interaction is critical to the existence of subjectively conscious existence. Veridically this is experienced as **subjective conscious intentionality affecting the unfolding states of the world** around us in our volitional behaviour, and through our intuitive “Aha” moments, imbuing the meaning of temporal existence as we move through the world and transform it. Corresponding to this active interaction of our subjective consciousness upon the world around us, which we describe as conscious “agency” and the sense of autonomous will over our circumstances, are **neurodynamics in self-organised criticality at the edge-of-chaos, which are not fully determined as a causal deterministic process.**

As a “prediction machine” the brain is seeking to anticipate both acute existential threats to survival which are environmentally uncertain events and bear the characteristics of quantum uncertainty, and opportunities for food, reproduction and social advantages which are likewise culturally complex at the limit of predictive determinacy. Thus the interaction between s and p consists of a brain in a complexity crisis of computationally intractable problems of prediction compounded by environmental and hence quantum uncertain processes due to multiple interacting butterfly effect perturbations, in turn interactively modulated by conscious intentionality. **The veridical experience of being a subjectively conscious intentional agent changing the physical universe through our behaviour is correct.**

Ram Vimal: SEC (ICAM Interactive complementary aspect monism) has no source; so what is its ontology?

Chris: Its ontology is the actual existential condition of “efficacy of subjective conscious intentional volition over the physical universe”, not an assumption of a formless God that made the cosmos, like your Nirguna Brahman idea. This ontology is a late comer in physical cosmology, arising through interactive climax of the fundamental forces, in biogenesis, evolution and conscious sentience.

I will now critique your claims that IDAM (inseparable dual aspect monism) or ICDAM (the complementary version), or Nirguna Brahman explain the hard problem extended to subjective conscious intentional autonomy over the world.

(2) Brahman as ultimate reality v Brahman as ‘Elohim

Due to lack of personal experience, you are describing Brahman “objectively” from the outside, in a way which misrepresents how the transcendental process works. All manifestations of Brahman, both Nirguna and Saguna occur during samadhi and moksha experiences of a visionary, meditating or religiously contemplating subject. Whether Nirguna or Saguna depends on the religious proclivity of the subject. Religious people will say they saw YHWH in a burning bush, or Lord Ram, or Ahura Mazda or the Virgin Mary or Kali because their religious expectation colours the visionary state to imbue it with theistic transcendence. Those who don’t perceive in religious terms see Brahman as ultimate reality in the abstract, as the infinite truth, once the doors of perception are flung open as living cosmology transcendent, rather like the Net of Indra.

Critical to this is the notion of moksha, which is escaping the round of birth and death in the visionary state. This is more than bliss. It is bursting the incarnate bubble of perception of organismic reality so we can see transcendence face to face in the abstract condition outside our incarnation. This needs to be transformative and change one’s world view as the acid test. Not just more bliss in samadhi but enlightenment – everything, everywhere all at once now and forever. We stand outside our incarnation and see mortality for what it is in the “Net of Indra” in the abstract condition. This is organismic consciousness asymptotically approaching the cosmic state by relaxing the cosmic boundary conditions imposed by the physical universe. Aurobindo would call this the supermind and posit that beyond is the ultimate reality that makes both the universe and our experience of it, but this is hypothetical.

The thing you need to understand is that these samadhi and moksha states are all and all have been in all Vedic discoveries subjective experiences of the rishis. No one experiences unmanifest reality, so the notion never arises. What is actually happening is that in the visionary state, the organismic brain becomes an experiential palette spanning all forms of sensory perception integrated into kaleidoscopic and dream-like visions. Because these also include the centres that process the experience of self and other including the world at large and these become mere the experiencer witnesses a variety of states from religious transcendence to natural immanence. So both the Nirguna and the Saguna experience are glosses of the full encompassing potentiality of subjective conscious experience running free of external physical constraints.

(3) Your notions of Nirguna Brahman as the interactive connection between subjective consciousness and the physical universe and epiphenomenalism

You claim incorrectly that no *s-p* interaction can occur and instead assume that the magic is performed by a null cosmic Brahman state that connects the *s* and *p* realms through unmanifest ultimate reality. This has zero explanatory power and is an imaginary use of ultimate reality to orchestrate every interaction we make with the world to ensure our own survival.

While prohibiting *s* and *p* interacting naturally in the survival of the organism, you are saying the cosmic mind has to solve the entire problem of what the organism should do to survive and do it for every sentient organism simultaneously in the universe. The critical thing about uniting science and experiential reality is Occam's razor. We need to find a compact explanation for the phenomenon with actual explanatory and potentially predictive power. Your notion raises the most intractable spectre of Nirguna lacking any manifestation having to determine every event in the universe in a predetermined manner. Why then do some people get cancer and others live long psychopathic lives. You have thus inbred all the tragic paradoxes of theism and injustice into every organismic action and reaction.

You make three incorrect claims:

- (1) That complementary inseparability "means changes in the *p* (*ns*) domain (physical brain processes) can automatically (because of inseparability) influence the *s* domain (conscious experiences), and vice versa. This influence, however, operates through a unified underlying ground (NNB), not through direct interaction".
- (2) That the inherent dynamism within the neutral ground generates both *s* and *p* (*ns*) aspects, with the *s* aspect embodying the qualitative richness of consciousness. This inherent connection explains why physical processes affect subjective experiences while maintaining the distinctness of the two domains.
- (3) Epiphenomenalism often reduces subjective experience to a mere byproduct of physical processes. IDAM and ICDAM, however, reject this reductionism. They acknowledge the irreducible nature of the *s* aspect and its unique character that cannot be fully explained by the *p* (*ns*) aspect alone.

Both (1) and (2) invoke turtles all the way down, confessing in the same breath that "This inherent connection explains why physical processes affect subjective experiences" but you don't state subjective experiences affect physical processes", showing that your frameworks are functional epiphenomenalism. This is clear from (3) where the only role for the *s* state is to affirm the *p* state cannot "explain" the *s* state which however remains epiphenomenalistic. But you do not reveal how an attributeless entity can functionally mediate categorically disjunctive *s* and *p* aspects when you reject outright any form of interaction between *s* and *p* or vice versa, when this IS assuming this through a super-natural intermediary.

The physicalist notion of epiphenomenalism that our brains made us do it and intentionality is a delusion of evolution to convince us to survive as automata is incorrect.

In Symbiotic Existential Cosmology, the physical processes remain causally incomplete without the interventions of subjectivity, which is what makes us all consciously alive and behaviourally efficacious over the physical universe. That is why Symbiotic Existential Cosmology couples the survival of the diversity of life to the future of consciousness in the universe as a subjective notion.

The interaction of subjective consciousness upon the physical world comes in multiple forms, intentional volition veridically confirmed by subjective experience, intuition, hunch, the "aha" moment, insight, acts of compassion and kindness, visionary states, and psychedelic experiences.

There is one *s* -> *p* interaction – **intentional volition**. There is one *p* -> *s* interaction **conscious perception**. There is also *s* -> *s* interaction e.g. in the visionary state. There are countless *p* -> *p* interactions, forming the fabric of causally open uncertain dynamics, but these are insufficient to determine the course of live agency, which is creative and physically transformative over homeostatic autopoiesis.

Although the physical universe can be conceived of as fermionically particulate and sub-dividable, the only *s* <-> *p* **interaction** which occurs in our context, is the subjective stream of consciousness interacting with the whole brain state reflecting it, in such a way as to prolong the survival of the organism through the advantage accrued by subjective consciousness perturbing the uncertainty of the entire complex physical system.

This cannot be meaningfully decomposed physically or subjectively. BOTH are interacting or resonating **s** and **p** as one whole coupled system.

If we are looking at individual eucaryote cells such as amoebae, or human white blood cells, the same interaction occurs at the cellular level, which is where it began.

Ram: Q1. Where do **s** and **p** come from?

Chris: Existential reality requires explaining ontologically how things actually are – why are we are subjectively experiencing conscious autonomous agents in a universe which is causally open due to the presence of objective stochasticity complemented by subjective intentionality / agency. Where they come from is to be inferred from how it became like this. SEC asserts that both primal subjectivity and the the cosmic origin are complementary aspects of the nascent existential cosmos.

The universe comes to fruition in biological consciousness because the symmetry-breaking of the fundamental forces leads to fractal molecularity, biogenesis, evolution and organismic sentience as ascending states of critical phase transition complexity. The key step from primal subjectivity to attentive/intentive consciousness arose from the topological transformation to the eucaryote cell to sequester respiration from membrane sentience. It is not a continuous emergence but a topological transformation.

Ram: Q2. Does each have its own ontology or source?

Chris: No because they are complementary. The universe can't manifest without subjective consciousness and consciousness can't exist without material climax complexity. At the inflationary cosmic origin there was a quantum fluctuation which possessed both vestigial sentience in the wave function extending throughout space-time and maybe outside it and intentionality in collapse of the wave function as complementary processes. These are physical aspects but they reflect intrinsic subjectivity, realised in Gaia effects, biogenesis etc.

Ram: Q3. Can **s** and **p** exist independent of each other?

Chris: No (see Q2).

Ram: Q4. If **s** is a latecomer then does it come from **p**?

Chris: No Subjectivity is primal (see Q1).

Ram: Q5. If **s** and **p** interact then they must be separable. Is this true?

Chris: No the interaction is dynamically inseparable. Conscious agency \leftrightarrow physical indeterminacy.

There are lots of physical realisations of inseparable interaction. The chaotic dynamics of a double pendulum is inseparable. The complexity of chaotic bifurcations arises from resonance between two simple harmonic processes.

It appears to experiencers that everything is subjective experience, but the physical universe is necessary for conscious life to exist.

Ram: Q6. What is **s** and **p** for a stone?

Chris: In a rock defined as a mineral solid with fixed molecular structure that is non-reactive, **s** is latent subjectivity that has no coherent means to express its presence dynamically in a quantum sensitive way. There are no butterfly effects or quantum sensitive phenomena, but this can be deceptive. A silicon crystal imprinted with quantum dots could be a quantum computer and manifest subjectivity if the principles are right. Liquid helium 3 has all kinds of quasi-particles and superfluid states that could display subjectivity as could phase transitions of molecular systems and some types of superconductor.

I don't expect any classical digital computation to do this, even a large language model, which is just fitting plausible word strings from human generated text, but bacteria are at the threshold of conscious awareness except that their cell membranes are devoted to energy production via electron transport so they can't use them informationally as well. Some rocks generate complex chemical reactions generative of the origin of life so there's another avenue. For example look up "Lost Sea Vents" and you will see the universe is set up so that cosmologically abundant olivine forming planetary crusts reacts with acidic seawater water to make chemical gardens which could generate life. The oceans and atmosphere have geochemical cycles creating Gaia effects like hurricanes and tornados.

Ram: Q7. Please elaborate further on "the interaction is dynamically inseparable.

Chris: You already demonstrated how the *s-p* interaction occurs in your question! When you wrote your reply, you had the subjective experience of my previous replies and you came to the conclusion that because the two pendulums were physical I needed to show you an example of *s-p* interaction, so you then formulated a subjective response and watched yourself typing out the message below physically, reading its meaning subjectively as you typed it, confirming to your subjective satisfaction that the underlying meaning of your statement was becoming what you consciously intended, and then pressed send, making the result fully physical to me as well. Watching yourself doing this is achieved by veridical perception of the relationship between your conscious intentions and the result in your emerging reply. Veridical perception applies as much to internal subjective experiences of intent and its affects in behaviour as it does to our three dimensional perception of the physical world. We have a very good experiential view of whether or not our subjective conscious intentions look like they are going to achieve the intended results and even their personal style and conviction.

This is clearly not the subjectively consciousless brain doing it on its own, or we would experience being passengers on autopilot. All epiphenomenalistic and physicalist theories attempt to rationalise this by claiming notions like evolution needs to con us into the idea that we are autonomous intentional agents so that we will have the confidence to survive. Neutral monist rationalisations are that the subjective view is just the inner reality of the physical process, but because the physical process is strongly causal, punctuated only by quantum indeterminacy, the physical view defaults to a form of stochastic causality eliminating any real capacity of the subjective conscious state to influence our physical circumstances.

I arrived at this conclusion by the most indirect route possible. I had an experience of cosmic consciousness on psychedelics, in which I came afterwards to realise that the critical question existence revolves around is in plain sight – **that subjective consciousness has efficacy of volition over the physical universe.**

This is the founding principle which unfolds the entire existential dilemma. From it follows the full complementarity of subjective and objective existence and the meaning of life and the role conscious intentionality has in healing the world and reflowering the living universe.

If we forsake this, we are either lost in Bertrand Russel's physicalist nightmare, of collocations of atoms heading to their final demise, or an idealist heaven and hell amid moral karmic retribution, or finally a 50 shades of grey notion of neutral monism which explains nothing by claiming *s* and *p* are different views of a single reality that defaults to physical stochastic causality. Any speculations about Nirguna Brahman being the origin of reality come long afterwards, just as inflationary physics comes long afterwards, with the explosion of science.

Panpsychic cosmologies are neither Neutral Monist (Stubenberg 2016), nor dualistic (Goff 2017). SEC as a complex form of panpsychism that cites only primal subjectivity as universal, but regards full consciousness as a discrete evolutionary result of the eucaryote endosymbiosis thus does not fit any pre-ordained philosophical framework. Unless and until you come up with theory of how an unmanifest featureless propertyless neutral entity can manifest either physicality or subjective consciousness SEC is not compatible with IDAM because it is Darwinian panpsychism and hence not neutral monism and neither is it dualism.

Ram: Cosmology is defined as (i) the scientific study of the origin and structure of the universe and (ii) the philosophical study of the nature of the universe. If SEC is cosmology then what is the scientific and philosophical origin/source and structure of our psycho-physical universe?

Chris: Symbiotic Existential Cosmology is designed to augment scientific cosmology into a psycho-physical cosmos by the inclusion of subjectivity, so it at this point accepts the inflationary origin but doesn't attempt to speculate about before origin models, like brane worlds, for the simple reason that these are not empirically verified and remain speculative and given the vast area it has to cover, only empirical evidence is included. We still don't know the full origin story, or the final state of the universe, in a heat death, cyclic process big crunch, or big rip, so these remain just speculatively discussed, as are hypothetical TOEs like superstrings.

To include psycho-physicality, primal subjectivity is included as a complement to the primal nature of early inflation in the unified force period, as a minimal "axiom" that solves the hard problem extended to efficacious volition and is assumed to be vestigial in the same way the nascent universe is. Introducing any further details or psychic complexities at the origin leads to problems of panpsychism and turtles all the way down of what made Brahman so so on – explanations by a cosmic consciousness more absolute than our experiences of samadhi and moksha that themselves retreat from an explanation because the hypothesis is more complex and demanding than the problem. There may be many versions of moksha but the acid test is experiencing existence outside one's incarnation and one's world view, being thereby transformed in a quantum change event.

Ram: ICDAM argues for (i) pre-BB (Big Bang) through a neutral entity (neither mental nor physical) scientifically as the origin (quantum vacuum with quantum fluctuations) and post-BB as a psychophysical universe, and (ii) philosophically, using Brhadāranyaka Upaniṣad cosmology. Thus, my goal is accomplished in bringing science and spirituality closer, i.e., their languages are different but the conclusion is the same. I feel fully content in this conclusion. Perhaps the same type of feeling you get after your psychedelic moksha; there are about 16 types of moksha. Thus, we both will return to the same source after our death, which is our moksha.

Chris: I actually like this point of view generally, except the claim that death is moksha. We don't possess our conscious existence and we know all living organisms and definitely all humans, manifest subjective consciousness. We know it is a complement coupled to our biological brains through their coherent climax transition state criticality. This invokes a sensory environmental boundary condition on our experience which SEC calls encapsulation and Deepak might call illusion, but allows intentionality to creatively facilitate our physical survival. This means that in a sense, consciousness is eternal and manifests in all conscious living organisms and is relinquished on our demise, apart from fringe near death experiences.

The living moksha state releases the encapsulations, but the super-mind is still a product of organismic consciousness with the doors of perception thrown open. This makes it possible to see reality outside our incarnations and realise the relationship between mortality and eternity and the sacredness of life's preservation in the mortal coil, which heals mortal angst and shows the true meaning of life. So this has attributes of both abstract experiential and sensory space and cosmic personae because the moksha state is integrating self and world/universe/others, so it has the attributes of personality in Saguna, as well as Nirguna Brahman. I'm not sure it is possible for cosmic consciousness to manifest except within a sentient being experiencing samadhi or moksha and suspect that the entire purpose of the physical universe is to bring about the organismic moksha state in the biota as the only way the conscious universe can come to know and understand itself in paradise on the cosmic equator in space-time. So the Big Bang is actually to make sexually naked lunch on the lawn of time while perennial paradise lasts.

Varieties of Panpsychist Philosophy

Panpsychism is the view that mentality is fundamental and ubiquitous in the natural world:

"The view has a long and venerable history in philosophical traditions of both East and West, and has recently enjoyed a revival in analytic philosophy. For its proponents panpsychism offers an attractive middle way between physicalism on the one hand and dualism on the other. The worry with dualism—the view that mind and matter are fundamentally different kinds of thing—is that it leaves us with a radically disunified picture of nature, and the deep difficulty of understanding how mind and brain interact. And whilst physicalism offers a simple and unified vision of the world, this is arguably at the cost of being unable to give a satisfactory account of the emergence of human and animal consciousness. Panpsychism, strange as it may sound on first hearing, promises a satisfying account of the human mind within a unified conception of nature" (Goff 2001).

Galen Strawson (2016), who advocates a form of physicalist panpsychism, claims it serves to reinforce the primacy of conscious experience against reductionistic materialism:

Every day, it seems, some verifiably intelligent person tells us that we don't know what consciousness is. The nature of consciousness, they say, is an awesome mystery. It's the ultimate hard problem. The current Wikipedia entry is typical: Consciousness "is the most mysterious aspect of our lives"; philosophers "have struggled to comprehend the nature of consciousness."

I find this odd because we know exactly what consciousness is — where by "consciousness" I mean what most people mean in this debate: experience of any kind whatever. It's the most familiar thing there is, whether it's experience of emotion, pain, understanding what someone is saying, seeing, hearing, touching, tasting or feeling. It is in fact the only thing in the universe whose ultimate intrinsic nature we can claim to know. It is utterly unmysterious.

The nature of physical stuff, by contrast, is deeply mysterious, and physics grows stranger by the hour. (Richard Feynman's remark about quantum theory — "I think I can safely say that nobody understands quantum mechanics" — seems as true as ever.) Or rather, more carefully: The nature of physical stuff is mysterious except insofar as consciousness is itself a form of physical stuff. This point, which is at first extremely startling, was well put by Bertrand Russell in the 1950s in his essay "Mind and Matter": "We know nothing about the intrinsic quality of physical events," he wrote, "except when these are mental events that we directly experience." In having conscious experience, he claims, we learn something about the intrinsic nature of physical stuff, for conscious experience is itself a form of physical stuff.

Strawson (2006) who sees panpsychism as the only way to deal with the hard problem, has an insightful and provocative philosophical defence of his philosophy of consciousness which he states forcefully. I will not depend on his physicalist panpsychist perspective, as symbiotic cosmology is a complementary description of the existential condition:

"What does physicalism involve? What is it, really, to be a physicalist? What is it to be a realistic physicalist, or, more simply, a real physicalist? Well, one thing is absolutely clear. You're certainly not a realistic physicalist, you're not a real physicalist, if you deny the existence of the phenomenon whose existence is more certain than the existence of anything else: experience, 'consciousness', conscious experience, 'phenomenology', experiential 'what-it's-likeness', feeling, sensation, explicit conscious thought as we have it and know it at almost every waking moment."

Strawson's view of realistic monism, as a form of panpsychism, is subtly different from eliminative materialism in a way which Strawson insists is huge, but remains unclear as to the exact nature of, especially when he says human consciousness is 'really just neurons firing':

Realistic physicalists, then, grant that experiential phenomena are real concrete phenomena — for nothing in life is more certain — and that experiential phenomena are therefore physical phenomena. It can sound odd at first to use 'physical' to characterize mental phenomena like experiential phenomena, and many philosophers who call themselves materialists or physicalists continue to use the terms of ordinary everyday language, that treat the mental and the physical as opposed categories. It is, however, precisely physicalists (real physicalists) who cannot talk in this way, for it is, on their own view, exactly like talking about cows and animals as if they were opposed categories. Why? Because every concrete phenomenon is physical, according to them. So all mental (experiential) phenomena are physical phenomena, according to them; just as all cows are animals. So when physicalists — real ones — talk as if the mental (experiential) and the physical were entirely different all they can really mean to be doing is to distinguish, within the realm of the physical, which is the only realm there is, according to them, between mental (experiential) features of the physical, and non-mental (non-experiential) features of the physical.

As a real physicalist, then, I hold that the mental/experiential is physical, and I am happy to say, along with many other physicalists, that experience is 'really just neurons firing', at least in the case of biological organisms like ourselves. But when I say these words I mean something completely different from what many physicalists have apparently meant by them. I certainly don't mean that all characteristics of what is going on, in the case of experience, can be described by physics and neurophysiology or any non-revolutionary extensions of them. That idea is crazy. It amounts to radical 'eliminativism' with respect to experience, and it is not a form of real physicalism at all. My claim is different. It is that experiential phenomena 'just are' physical, so that there is a lot more to neurons than physics and neurophysiology record (or can record). No one who disagrees with this is a real physicalist, in my terms.

The difficulty here is that Strawson is claiming subjective experience is realer and more immediate than the physical universe but then claims it IS physical when he claims we don't know what physical is. This looks a little like a finesse of promissory materialism turned inside out!

We can distinguish various forms of panpsychism in terms of which aspect of mentality is taken to be fundamental and ubiquitous. Two important characteristics of human minds are thought and consciousness. In terms of these characteristics we can distinguish the following two possible forms of panpsychism:

Panexperientialism—the view that conscious experience is fundamental and ubiquitous

Pancognitivism—the view that thought is fundamental and ubiquitous.

Thought is obviously a much more structured and structurally complex notion than experience, and there may be entities from a single quantum at one extreme, to a eucaryote cell at the other, which may readily possess a subjective aspect identifiable with experience, but not be capable of structured thought.

A second division is that between **panpsychism** and **panprotopsychism**, which asserts that some form of proto-consciousness rather than consciousness per-se is fundamental and ubiquitous. Just as the properties that characterise conscious experience are commonly referred to as “phenomenal” proto-conscious properties are “protophenomenal” – properties that in certain combinations transparently account for the existence of consciousness, in the sense that one could in principle move a priori from knowing the relevant facts about protophenomenal properties to knowing the relevant facts about phenomenal properties (Chalmers 2015; Goff 2015, 2017).

The combinations problem gives rise to further ones like the structural mismatch problem (Chalmers 2016):

An especially pressing aspect of the structure combination problem is the structural mismatch problem. Macrophysical structure (in the brain, say) seems entirely different from the macrophenomenal structure we experience. Microexperiences presumably have structure closely corresponding to microphysical structure (this is especially clear on a Russellian view), and we might expect a combination of them to yield something akin to macrophysical structure. How do these combine to yield macrophenomenal structure instead?

A third division as originally defined by Chalmers (2015) is:

Constitutive panpsychism—Forms of panpsychism according to which facts about human and animal consciousness are not fundamental, but are constituted of facts about more fundamental kinds of consciousness, e.g., facts about micro-level consciousness.

Non-Constitutive panpsychism—Forms of panpsychism according to which facts about human and animal consciousness are among the fundamental facts.

Symbiotic cosmology is **non-constitutive** as it considers the relation between biological and quantum forms of panpsychism to be differing subjective manifestations complementary to differing degrees of coherence in the physical aspects these subjective aspects correspond to, for example eucaryote excitability is a coherent quantum-sensitive form of edge of chaos excitation giving rise to new forms of “quasi-particle” excitations, so its subjective aspect is qualitatively distinct from quantum panpsychism and is not conceived from semi-objective structural interactions of its quantum parts.

The work of Schaffer (2010) has advanced an alternative picture of reality, from the view that micro e.g. quantum events determine events at large. According to “priority monism”, facts about little things are grounded in facts about big things – all things ultimately exist and are the way they are because of certain facts about the universe as a whole. If we combine priority monism with constitutive panpsychism we get:

Constitutive cosmopsychism — The view that all facts are constituted of consciousness-involving facts at the cosmic-level. Just as the micropsychist holds that electrons have experience but not thought, so the cosmopsychist holds that the universe has some kind of experience, but may refrain from attributing thought or agency to the universe.

Bertrand Russell (1927) proposed a novel approach to the mind-body problem. Arthur Eddington (1928), in his Gifford lectures of the same year, independently expressed very similar thoughts. Russellian monists are motivated by the need to characterise the intrinsic nature of matter:

A **Negative**: The information we get from the physical sciences is in some significant sense limited. There are subtle variations on how exactly this is put, but the idea is that the physical sciences only tell us about the extrinsic, relational, mathematical, or dispositional nature of matter, and leave us in the dark about its intrinsic, concrete and categorical nature. Physics tells us how an electron behaves, but it doesn’t tell us how it is in and of itself.

B **Positive**: The intrinsic/concrete/categorical features of matter which physical science remains silent on account for the existence of consciousness. The problem of consciousness, the difficulty seeing how consciousness fits into the physical world, is the result of our not taking into account these “hidden” features of the physical world.

Constitutive cosmopsychism is thus a form of Russellian monism according to which (i) all facts are grounded in facts about the universe as a whole, (ii) the universe instantiates consciousness-involving categorical properties.

David Chalmers (1995, 1996) first delineated the **hard problem of consciousness** – why it is that a person has subjective experience. Philip Goff (2001) writing in *The Stanford Encyclopaedia of Philosophy* (Zalta 2012) notes: *“Some think the alleged problem involves a confusion, although anyone who thinks this is obliged to diagnose the exact root of the confusion. Others think that there is a problem, but one that further scientific investigation will solve. Perhaps we just need to wait for the arrival of the “Darwin of consciousness” to make progress”*. However, there is no reason to suppose that “further scientific investigation” has to be pursued under the methodological assumption that consciousness is to be accounted for in terms of processes which don’t involve consciousness, e.g., in terms of facts about non-conscious neurons. The panpsychist proposes an alternative approach: explain human and animal consciousness in terms of more basic forms of consciousness. These more basic forms of consciousness are then postulated as properties of the fundamental constituents of the material world, quanta.

Ironically in debate on panpsychism, Darwin’s name has come up three times. Seth (2021), in critiquing panpsychism, advances the case that the success of materialistic science is based on explanation, prediction, and control (EPC), the criteria by which many scientific enterprises are assessed, thus reducing biological 'vitalism' in a demystifying dissolution into molecular biology. Goff (2019) has countered that some scientific advances such as Darwin's theory of evolution “emerged from a dramatic insight, rather than incremental dissolution”. But the objection to EPC is fundamental, because, at the very climax of biology, neuroscience has currently no idea of how to solve the hard problem or how the easy problems might be combined to evoke consciousness either, as noted in the Darwin comment above.

Seth returns to Goff’s view of Darwin *“Finally, many successful scientific explanations operate with qualitative rather than, or as well as, quantitative concepts. Darwin’s theory – highlighted by Goff as a paragon of materialist science – provides one striking example of such an explanation.”*

Goff is also critiqued for disregarding empirical evidence: *“Goff’s defense of panpsychism therefore needs to involve an argument to the effect that his view is preferable to the structural realist and empiricist alternatives.”* (Laasik 2020).

I have entitled the form of panpsychism advanced in Symbiotic Existential Cosmology Darwinian panpsychism for four specific reasons:

- (a) It advances a careful objectively empirical interpretation of which physical systems possess forms of panpsychism or sentient consciousness based on seven essentially evolutionary criteria, namely: (a) individual quanta, (b) critically unstable multi-quantum dynamical systems including (c) living cells, (d) in sentient form in eucaryotes (e) in organismic form in multi-celled organisms (f) in the evolving biosphere and (g) collectively in the universe.
- (b) It applies objective physical criteria to which coherently unstable systems in the natural universe possess psyche or consciousness based on their physical and biological properties, avoiding an attempt at decomposing the subjective aspect leading to the combinations and related problems.
- (c) It broadly coincides with Darwin’s own speculations on consciousness extending down to founding biota, extending it only into dynamically unstable physical and quantum phenomena which also possess attributes consistent with the evolutionary view.
- (d) Like Goff's comment, it was devised as a result of a startling insight on psychedelic mushrooms, not EPC and it depends on qualitative, not quantitative criteria.

*“To see a puppy playing [one] cannot doubt that they have free-will”
and if “all animals, then an oyster has and a polype.” (Darwin ex Smith 1978)*

Ironically symbiotic cosmology solves this paradox by using an evolutionary view of panpsychist cosmology in which the transition from quantum subjectivity to organismic consciousness is matched to evolutionary quantum leaps – in particular the formation of cellular life and the eucaryote endosymbiosis. So on all three counts – the Darwinian “insight” of the evolutionary mushroom-evoked cosmology, the qualitative nature of the evolutionary investigation and the actual bringing of the hard problem to a solution, it is a “Darwinian” model of conscious evolution.

The intrinsic difficulty with Seth’s so-called “real” problem of consciousness – how to distinguish different types of qualia e.g. red and blue sneakers, is that it completely fails to address the root question of subjectivity, which is by

nature entirely different from the localisable, analysable, distinguishable and separable properties of objective reality and arises in both quantum observation in physics and the hard problem in neuroscience in complementary ways.

Thomas Nagel (1979) influentially argued that adopting a view like panpsychism is the only way to avoid **radical emergence** (Strawson 2006) – properties of a complex system that cannot be intelligibly derived from the properties of its parts, in contrast to “emergentist panpsychists” where they may not be intelligibly so derived. For Nagel, “emergent” properties of a complex system are ones that cannot be intelligibly derived from the properties of its parts. In contrast, for the “emergentist panpsychists” discussed above, “emergent” properties of a complex system are simply fundamental macro-level properties, which may or may not be intelligibly derived from the properties of its parts. Following Galen Strawson (2006a) we can use the word “radical emergence” to express Nagel’s notion of emergence.

Nagel’s argument involves four premises:

Material Composition – Living organisms are complex material systems with no immaterial parts. The matter composing us is not special; the matter composing any material entity, if broken down far enough and rearranged, could in principle be incorporated into a living organism.

Realism – Mental states are genuine properties of living organisms.

No Radical Emergence – All properties of a complex organism are intelligibly derived from the properties of its parts.

Non-Reductionism – The mental states of an organism are not intelligibly derived from its physical properties alone.

Strawson (2006) has defended a similar argument from the untenability of radical emergence. Whereas Nagel’s aim is merely to establish the disjunction of panpsychism and panprotopsychism, Strawson’s argument concerns the truth of panpsychism. Strawson begins by arguing that radical emergence is upon reflection unintelligible:

Emergence can’t be brute. It is built into the heart of the notion of emergence that emergence cannot be brute in the sense of there being absolutely no reason in the nature of things why the emerging thing is as it is (so that it is unintelligible even to God). For any feature Y of anything that is correctly considered to be emergent from X, there must be something about X and X alone in virtue of which Y emerges, and which is sufficient for Y (Strawson 2006 18).

Thus, the crucial feature of intelligible emergence, is that the relationship between the product of emergence and its producer can be adequately characterised using a single set of conceptually homogeneous concepts. But it’s very hard to see how any set of such concepts could capture both the experiential (i.e., consciousness-involving) and the non-experiential (non-conscious-involving), and hence how the thesis that consciousness emerges from non-consciousness could be rendered intelligible. It is only by supposing that human and animal consciousness emerges from more basic forms of consciousness, e.g. in the eucaryote endosymbiosis discretely transforming primitive subjectivity, that we have hope of avoiding the emergence of animal consciousness being a brute and inexplicable miracle.

There is a second prominent argument for panpsychism, which has nothing to do with the need to explain human consciousness, but begins from a gap in the picture of the world in the physical sciences. This argument has its roots in Leibniz, Schopenhauer⁹⁸, Russell (1927) and Whitehead (1933 [1967]), and is defended by many panpsychists, including Sprigge (1999), Strawson (2003) and Goff (2017).

In the public mind, physics is on its way to giving us a complete account of the fundamental nature of the material world. It seems almost tautological that “physics” is the true theory of “the physical”, and hence that it is to physics we should turn for an understanding of the complete nature of space, time and matter. However, this commonplace opinion comes under pressure when we reflect on the austere, mathematical vocabulary in terms of which physical theories are framed. It is not clear that such an austere vocabulary can even in principle capture the complete nature of concrete reality. A mathematical description of a situation abstracts from concrete reality and statements having the general force of natural law can only express information about how physical entities are disposed to behave. This is fine if we want to do is predict, say, how electrons will behave (except that we can’t individually). But intuitively there

⁹⁸ According to Arthur Schopenhauer, it is the laws of nature that arise from a transpersonal will, not the will from the laws of nature. Felt volitional states are the irreducible foundation of both mind and world. For Schopenhauer the inner essence of everything is conscious volition – that is, will. Nature is dynamic because its underlying volitional states provide the impetus required for events to unfold. Even in the absence of all self-perception mediated by the sense organs, we would still experience our own endogenous, felt volition. Will is indeed free because it is all there ultimately is.

must also be an intrinsic nature to an electron; there must be an answer to the question “How is the electron in and of itself?” And this question doesn’t seem to be answered by describing how electrons are disposed to behave.

Some philosophers, known as “dispositional essentialists”, hold that all fundamental properties are pure dispositions. On this view, once we have fully described how for example an electron is disposed to behave and have thereby said everything there is to be said about the nature of the electron. However, there are powerful arguments against the intelligibility of this position. Most discussed is the charge that it leads to vicious regress. For any given disposition X, we understand the nature of X only when we know the nature of its manifestation, that is, the property it gives rise to when manifested. If this argument is sound, then physical theory will never provide us with a complete and adequate account of the nature of the material world.

The panpsychist has a proposal: the intrinsic nature of matter is, at least in part, consciousness. What is to be said in favour of this proposal? The first thing is that it is not obvious that we have an alternative proposal, at least at present.

Another argument turns on the assumption that evolution is a continuous process that moulds pre-existing properties into more complex forms, but that cannot produce “entirely novel” properties:

“we cannot suppose that so enormous a jump from one creature to another should have occurred at any point in the process of evolution as the introduction of a fact entirely different and absolutely separate from the physical fact. It is impossible for anybody to point out the particular place in the line of descent where that event can be supposed to have taken place. The only thing that we can come to, if we accept the doctrine of evolution at all, is that even in the very lowest organism, even in the Amoeba which swims about in our own blood, there is something or other, inconceivably simple to us, which is of the same nature with our own consciousness” (Clifford 1886:266)

“we ought ... to try every possible mode of conceiving of consciousness so that it may not appear equivalent to the irruption into the universe of a new nature non-existent to them” (James [1890] 1950: 148).

More recently, Goff (2013) has argued that consciousness is not vague – if consciousness does not admit of borderline cases, then we will have to suppose that some utterly precise micro-level change – down to an exact arrangement of particles – marked the first appearance of consciousness (or the change from non-conscious to conscious embryo/foetus), and it is going to seem arbitrary that it was that utterly precise change that was responsible for this significant change in nature.

A final motivation for panpsychism comes from the need to account for mental causation in a way that is consistent with alleged causal closure of the physical: the thesis that every physical event has a sufficient physical cause (Chalmers 2015; Goff 2017: ch. 6). If, as the dualist believes, consciousness exists outside the physical world, it is hard to see how it could impact on a causally closed physical system. But if, as the panpsychist believes, consciousness infuses the intrinsic nature of the material world, then consciousness and its effects are part of the system.

It is generally agreed, both by its proponents and by its opponents, that the hardest problem facing panpsychism is what has become known as the “combination problem”. The inspiration for the problem is the following passage:

“Take a hundred of them [feelings], shuffle them and pack them as close together as you can (whatever that may mean); still each remains the same feeling it always was, shut in its own skin, windowless, ignorant of what the other feelings are and mean. There would be a hundred-and-first-feeling there, if, when a group or series of such feelings were set up, a consciousness belonging to the group as such should emerge. And this 101st feeling would be a totally new fact; the 100 feelings might, by a curious physical law, be a signal for its creation, when they came together; but they would have no substantial identity with it, not it with them, and one could never deduce the one from the others, nor (in any intelligible sense) say that they evolved it.” (James [1890] 1981: 160)

The general consensus among panpsychists is that there is currently no wholly adequate solution to the combination problem, however symbiotic cosmology derives the subjective aspect from each complementary physical aspect as a manifestation of it, so does not attempt a quasi-reductionistic view of the subjective as in classical panpsychism.

In David Chalmers’ (2016) taxonomy of the combination problem, there are three dimensions of difficulty:

Difficulties relating to subject combination: the core difficulty being the **subject-summing** problem

Difficulties relating to quality combination: the core difficulty being the **palette** problem

Difficulties relating to combination of structure: the core difficulties being the **structural mismatch problem** and the **grain problem**.

Symbiotic cosmology largely avoids the combination problem because it is not seeking a panpsychic analysis of the subjective aspect, but rather looks at physicalist, biological and neurophysiological descriptions to delineate differences between qualia such as vision and sound both in terms of the differing quantum modes they access and the types of CMS processing involved because these are features that can be interrogated objectively as boundary conditions on the kind of subjective experience involved. This is because the focus is not on a reductionistic description of the subjective aspect of brain processes but establishing the cosmological complementarity as a whole that is necessary to solve the hard problem and the problem of volitional will in a coherent cosmological account.

Many panpsychists believe that the conscious mind is identical with, or bears a very intimate relationship with, the brain. Most Russellian monists, for example, believe that the conscious mind is the intrinsic nature of the brain. And all constitutive micropsychists think that human experience is grounded in the properties of micro-level entities. Thus, these forms of panpsychism face the challenge of explaining how the rich structure of consciousness results from, or at least co-exists with, the seemingly very different structure of the brain. Perhaps the most discussed form of the structural mismatch problem is the grain problem the worry that experiences seem to be smooth and continuous in a way that is at odds with the discrete, particularised structure of brain properties.

Again there are numerous proposals for addressing the worry. Lockwood (1993) for example suggests that the worry only arises when we are implicitly thinking of the brain in terms of classical physics, and that it evaporates when we explicitly adopt more recent scientific paradigms. Symbiotic cosmology likewise sees the brain properties arising from edge of chaos sensitivity to quantum processes at unstable tipping points in the conscious brain dynamics, so invokes both wave properties of brain states and wave-particle complementarity so that there is no actual discordance of mental continuity and the quantum nature of reality, which is manifested in a complementarity between objective universe and subjective mind at large.

For a diverse current account of the interplay between proponents and opponents of panpsychism, [Philip Goff's](#) webpage [Conscience and Consciousness](#) contains links to scientists, philosophers, and theologians with a variety of views debating Goff (2019). In this series of articles, The author [Annaka Harris](#) points out that the combinations problem ceases to exist if consciousness in her words akin to a pervasive field analogous to space-time in my words to the universe as a whole:

"Rather than an obstacle to theories that place consciousness in a fundamental role, the combination problem may be a reason to favor the proposition that consciousness is a fundamental feature of the universe in the form of a continuous, pervasive field, analogous to spacetime. Just as spacetime and gravity have an interactive relationship, consciousness might be thought of as a fundamental "field" that interacts with, and is integral to, matter. We typically don't think of spacetime as bits and pieces that build on one another (it's simply everywhere), and I don't think we should be tempted to think of consciousness, if it is indeed a pervasive field, as divisible into building blocks either."

This is confluent with the defence of symbiotic cosmology using panpsychism in a way which utilises a physicalist position to characterise the subjective in its complementary objective evolutionary terms from cell to eucaryote to organism, including edge-of-chaos systems with quantum phenomena due to the butterfly effect, so characterising, in each case, consciousness as a whole. Really the combinations problem proto-psychism etc. is an attempt to think reductively about the subjective, the very thing we are trying not to think reductively about.

[Lee Smolin et al.](#) also highlight exactly symbiotic cosmology's point of intervention in the causal closure:

"There will be a mixed functionalist and reductive explanation for why humans and other animals experience qualia (or just experience). It is then very natural to suppose that if the existence of consciousness is to be explicable for a physicalist, it must perform some function that increases the fitness of the creature that is endowed with it. But this requires that consciousness can intervene in the network of causes in the physical universe."

*"Most of the approaches to quantum foundations do split the laws into two parts, the first being described by unitary Schrödinger evolution in a fixed Hilbert space, which we identify with **Mode I**. In most formulations, quantum mechanics is more than this. Collapse of the wave-function, whether spontaneous or based on a law of some kind, is strictly **Mode II**."*

This parallels symbiotic cosmology accepting mode I as causal and allowing the subjective aspect to intervene in mode II, thus completing the incomplete causal closure of the quantum universe without disrupting causality.

Chris Koch's position which I had to get out of another article ([Koch 1](#)) classes himself as a panpsychist but really he is an information network panpsychist as expressed in [Tononi and Koch's](#) (2015) integrated information theory. But nevertheless sees consciousness potentially on multiple scales:

"The only dominant theory we have of consciousness says that it is associated with complexity — with a system's ability to act upon its own state and determine its own fate. Theory states that it could go down to very simple systems. In principle, some purely physical systems that are not biological or organic may also be conscious" ([Koch 2](#)).

In this article, Koch is worried about humanity self-destructing and cites the Fermi Paradox as evidence intelligent societies self-destruct, which is why I'm introducing cosmological symbiosis as a climax remedy for avoiding a human induced mass extinction of the diversity of life which could do just that.

Galileo's error as expressed by Smolin et al., talking about Goff is this:

"The core of Galileo's new science was the idea that all motion could be represented mathematically while all change could be rendered as motion. To make this credible not only was part of the world discarded but memory of it erased. Sensations, colors and thoughts were not part of the mathematical universe and that came to be thought of as the only universe there was. Galileo's error in removing qualities, sensations and awareness from the world, leaving only a universe of quantities and of quantifiable relationships, led to an equally profound error about the nature of time. The success of the science of motion led to the hypothesis that the motions and forces of the world - from atoms up to stars - were a system that was causally closed, as all explanations of motion pointed to more motion. "

Where have I heard this before? Evolutionary psychology and sociobiology. This is the old gatherer-hunter divide between categorisation in woman gatherers identifying plant species and male hunters stalking their prey silently. Men are or claim to be "ace" at mental rotation and describe a route as hunters in terms of a set of vectors to the destination and women say "go past the gas station to the child care centre".

So materialism or physicalism is another hideous manifestation of patriarchal dominion over nature and woman alike. In Goff's view Galileo has taken the feminine qualia out of the description and Newton has sealed the deal and we are still stuck in the classical description of the causally closed Laplacian universe, despite staring quantum reality in the face. This is another manifestation of complementarity that shows up materialism for just what it is.

Miller (2021) notes that cosmopsychists have their own combination problem but turned on its head — the decombination problem: how can a subject and its experience decompose into other subjects and their experiences?

Goff (2019b) poses the question "Did the universe design itself?" by invoking a form of constitutive cosmopsychism. In his words this might not provide an intelligent form of psyche:

"The claim that the universe is conscious does not imply that it has any of the sophisticated mental features enjoyed by human beings, such as thought, intelligence and agency. In our case, these mental phenomena are the result of millions of years of evolution; one might doubt that they could also be properties of things, such as the universe, which have not evolved through natural selection. Indeed, in previous work ([Goff 2017](#)), I suggested that the cosmopsychist conceive of the consciousness of the universe as being a 'mess' entirely lacking in elements of thought and rationality".

Goff then amends this "primitive" cosmopsychism to address the fine tuning problem, the fact that the current description of the physical universe, comprising the standard model plus gravity has about [25 free parameters](#) which the theories themselves don't explain. The fine tuning problem was first drawn attention to by Dicke (1961) and has been elaborated by Barrow and Tipler (1988) using the anthropic cosmological principle and Martin Rees (Lemley 2000). The [fine tuned universe](#) has reached quasi-religious dimensions in the minds of its proponents.

A key cited example is that ϵ , a measure of the nuclear efficiency of fusion from hydrogen to helium, is 0.007: when four nucleons fuse into helium, 0.007 (0.7%) of their mass is converted to energy. The value of ϵ is in part determined by the strength of the strong nuclear force. If ϵ were 0.006, only hydrogen could exist, and complex chemistry would be impossible. According to Rees, if it were above 0.008, no hydrogen would exist, as all the hydrogen would have been fused shortly after the Big Bang. Other physicists disagree, calculating that substantial hydrogen remains as long as the strong force coupling constant increases by less than about 50%, but these parameters are critical to the cosmic distribution of the elements, especially the elements of life, as outlined in [fig 17](#).

Dicke cited $\frac{Gm_p^2}{\hbar c} \sim 5 \times 10^{-39}$, as a near-vanishing constant involving the mass of the proton, the gravitational coupling constant, Planck's constant and the speed of light, but these parameters may be defined by a deeper theory of everything (TOE) determining the symmetry-breaking parameters in the cosmic origin. Dicke noted that most physicists seem to believe that such a dimensionless constant, such as (1), is provided by Nature, cannot be calculated, and is not in any way related to other numbers, although Dirac has suggested a deeper law connecting these on powers of 10^{40} , for example $\frac{Tm_p c}{\hbar} \sim 10^{42}$, where T is the Hubble age of the universe.

But some of these problems arise from the way quantum field theories and relativity have been constructed. For example, the fine structure constant determining the convergence of the Feynman diagrams of quantum electrodynamics fig 1: $\alpha = \frac{1}{4\pi\epsilon_0} \frac{e^2}{\hbar c} \sim \frac{1}{137}$. Quantum electrodynamics is the most accurate theory ever devised calculating the magnetic moment of the electron correctly to six decimal places. It forms an archetype of all the quantum field theories in the standard model. This means that all in all the way these theories have been built upon empirical variables these types of theory don't determine the empirical parameters out of which they are constructed. However a deep TOE might do precisely this because the overall structure of these theories is elegant involving symmetries that are then broken by symmetry breaking potentials like the Mexican hat precipitating the weak-electromagnetic symmetry-breaking. So deeper TOEs which unify all the four forces might do so.

Goff instead invokes features of a primitive cosmopsychism that might do this from the subjective aspect instead, by invoking two modifications to the messy primitive universal consciousness (1) agency and (2) a form of future awareness:

"The first modification I will be proposing is that the universe, although physical, acts, and only acts, through a basic capacity to recognise and respond to reasons."

This has all sorts of problems because "reasons" and "facts" are optimally sophisticated concepts and Goff admits they could sweepingly overrule and define physical laws:

"How do the laws of physics fit into this picture? If the universe acts through a basic capacity to recognise and respond to reasons, and all facts are grounded in facts about the universe, the laws of physics seem to be irrelevant to the causal evolution of the universe."

He then addresses the central question of fine tuning having to anticipate its own cosmological outcomes:

"If, during the Plank epoch, the early universe fine-tuned the laws to bring about life billions of years in the future, then it must have in some sense known, or been aware, of the future consequences of its actions. In other words, to make sense of the idea that the early universe fine-tuned the laws and initial conditions in order to bring about life, we need to make sense of the idea that the universe has mental states that represent the future."

"I propose that the agentive cosmopsychist should suppose that the universe has a basic disposition to form spontaneous mental representations of the complete future consequences of all of the choices available to it."

This is something that is already implicit in special relativity in the usual physical interpretation, where both retarded (causal) influences and advanced (retrocausal) come out as positive and negative square root solutions of the defining Lorenz transformations giving us results defining the velocity of light as a maximum and $E = mc^2$.

My real concern here is that agentive cosmopsychism, by virtue of possessing willing agency inherits the idiosyncrasy of will without which it would be impotent, so this leaves us with a regress why such an agent should decide to act in a way to bring life about. So in my view, although proposing Darwinian panpsychism, as a cosmological solution to the hard problem is that we need to wait a little longer to see if an underlying TOE will emerge that explains fine tuning in terms of symmetry-breaking, before relying on either a multiverse, anthropic, or a cosmopsychic solution to the fine-tuning problem.

Cathy Reason: How does SEC solve the problem of how panpsychism is divided

Chris K: Because I'm not decomposing the subjective. Qualia in SEC are features of the way the brain acts as a filter on primary subjectivity not "parts" of panpsychism. I agree with your critique of classical panpsychism, especially pan-proto tying itself in knots and qualia being treated as things that have to be put together to make experience, the combinations problem etc.

Materialism leads to an irreducible explanatory gap about subjective experience, so the logic has to work backwards – matter must have mind at the foundation as a cosmological complement. I.e. primitive quantum-psychism with no subdivisions. The subdivisions all occur in physical reality driven by fermionic divisibility of matter. The brain dynamics doesn't fully cause conscious states but acts as a contextual boundary filter on the mind at large as Huxley put it. Subjective consciousness then makes integrated choices exercising free will through quantum uncertainty because that's the only avenue it has, without inducing causal conflict with classically certain brain function and because it is enough to split the wave function defining history.

Cathy R: How do you start with a single cosmic subjective experience and end up with a preferred set of complex individual experiences?

Chris K: We don't know we start with a single cosmic subjective experience. SEC just asserts primal subjectivity not cosmic consciousness. Primary subjectivity has to be fully compliant with all determinately causal aspects of the physical dynamics or subjective-objective conflict would arise. So it has to exploit quantum uncertainty which is what its evolutionary advantage actually is, although it's counter-intuitive. We think we are making reasoned decisions but that is largely derived from brain function, so we think uncertainty is random, but that's our cubic centimetre of chance to avoid the tiger pounce and survive when all the computational odds become intractable because the tiger is exploiting them too.

Cathy R: But this just replicates what I called the preferred partition problem -- why and how is subjectivity partitioned according to the dynamics of brains, rather than, say, the dynamics of individual molecules?

Chris K: Because biological matter is fractal, the brain dynamics ARE the molecular dynamics so the explanation arises from molecular quantum fractality, which is much more complicated than simple scale invariance, as illustrated in [figure 54](#), fractal biocosmology.

To give a very general outline, conscious subjectivity is partitioned by how a system exploits and responds to uncertainty. Each neuron is a conscious eucaryote cell. We experience the coupled state of billions of these in organismic consciousness, but as individuals they are putatively also conscious as in cell migration in early brain development and neural plasticity in the adult.

Cathy R: You cannot justify that choice empirically because no prediction you make about this preferred partition could ever be testable. Panpsychism cannot, by definition, be proven empirically. Because it is impossible to know if inanimate matter has subjective states. The only subjective states which panpsychism predicts are the ones we already know about, and the ones we can never detect.

Chris K: Empirical science verified by experimental investigation is the foundation hallmark of the scientific method and it applies both to objective observation and subjective experience. While subjective consciousness can only be experienced, behavioural volition is physically evidential up and down the scale. Testability is a challenge with all subjective experiences, even the ones we know we do have, although it can be done through subjective reports.

Cathy R: Do you mean that both the brain and all its cells map on to the *same* conscious state?

Chris K: Yes when they are dynamically linked but NOT as mappings. Mappings are functional definitions on points or parts. That's simply not how it works, because its a pure abstract objective description. Watch the video of [Dictyostelium - a Cellular Slime Mold](#) and you have an example of volitional behaviour both at the individual cellular and organismic collective levels. Dictyostelium has two active modes, individual in single foraging cells and then coupled in the worm and later fruiting stages. The individual mode is very similar to individual human neutrophil phagocytes [1](#), [2](#). Each mode gives rise to different – independently distributed or coherently unified versions of “consciousness” in the same cells, because the organism has evolved to make this possible, and our brains have conserved the unified mode. The switch occurs as soon as the individual amoebae come into membrane contact.

Cathy R: Or do you mean that every possible subset of cells maps onto some separate non-intersecting conscious individual? In that case it would have to be possible for the same cell to map on to several separate conscious individuals.

Chris K: No unless you are talking Psi which I accept on an incidental but not provable basis.

Cathy R: Or are you trying to claim that conscious individuals actually comprise other conscious individuals? Because that would contradict the meaning of individuality.

Chris K: Not unless they're telepathic, which I also accept on an incidental but not provable basis.

Cathy R: I prefer to express the problem in terms of set theory or category theory, because they are both very powerful abstract formalisms. But the preferred partition (decombination) problem (Miller 2021) is not dependent on the formalism. Feel free to use any formalism you want, but so far the only way you have been able to deal with the problem is by axiomatizing it away.

Chris K: Subjective consciousness is the prima facie, sine qua non reality, through which we know the universe exists. It IS axiomatic Cathy. It's the correct "mathematical" approach! Demanding to prove something that is axiomatic is futile, as Godel demonstrated.

Cathy R: But what is not axiomatic is your claim that all matter has a subjective aspect, and your choice of a preferred partition whereby certain elements of the physical world, such as brains, map on to conscious individuals, but other elements, such as molecules, do not.

Chris K: The claim that all matter has subjectivity IS axiomatic! If neurons do then their molecules do when they are participating in a process which is resonant and is responsive to uncertainty, as in edge-of-chaos membrane excitation. The coherently integrated form is functionally a quantum fractal. I already cited the fractal biocosmology [figure 54](#), which runs from fundamental particles through molecules to super-molecular assemblies to subcellular organelles to cells to organs to organisms. It's a quantum fractal from foundation to sentience.

In a subjective conscious experience, the brain, it's neurons and its molecules are all coupled together in a coherent edge-of-chaos dynamic which means they are forming a fractal complement of the subjective conscious state. They are all acting and contributing together in a fractally-coupled dynamic. We don't know it's a mapping or a functor because these are objective abstract models of functional relationships. Indeed, we don't know the relationship is functional as such. To be precise, boundary conditions are not functional relationships. A function is causally forward – i.e. for all x in X there exists a unique $y = f(x)$ in Y . Rather we have a physical system in an indeterminate state and there is a volitional "mapping" from the subjective to the objective, limited by the physical boundary conditions which give the conscious experience its world view via the brain. But this limitation is not causally determinate, which is what gives free-will room to move.

Cathy R: But any form of panpsychism – including yours — requires a preferred partition because there are all sorts of ways of partitioning the physical world into discrete individuals and you have chosen just one of them.

Chris K: Yes the universal one Cathy. You could try to say the same thing about the standard model of physics.

Cathy R: If you claim it is universal, then you have to *show* that it is universal. You haven't done so.

Chris K: No, it's an axiom! The only evidence either of us have to bring to bear on this issue is (a) through direct subjective experience or (b) through objective analysis. Neither of us have any direct access to forms of conscious experience outside our own personal human organismic experience, because that is axiomatic to what subjectivity is – experience private to the subject. The SEC analysis of the physical aspect – i.e. quanta, uncertainty-sensitive unstable molecular systems, biogenesis, prokaryote excitability, eucaryote attentive sentience, organismic consciousness, biospheric evolution and cosmology itself is manifestly and indisputably universal to the maturation of the symmetry-breaking consequences of the standard model. The physicist's lament at the failure of string theories and other TOEs to fully define the standard model of physics confirms that your critique demanding proof of universionality is as true for the standard model, as for Symbiotic Existential Cosmology.

Cathy R: You need to explain why you think all matter has a subjective aspect (because I can't see any reason why it should, and it is not parsimonious to assume things for which one has no evidence).

Chris K: The conclusion is more parsimonious than any other because it is arrived at by rejecting the physically materialist notion of causal closure of the universe as inconsistent with our empirical experience of subjective conscious volition over the world around us, aka the physical universe. But it's more than parsimonious, it's necessary because rejecting conscious volition makes a full cosmological representation of subjective and objective reality impossible because one contradicts the other. Conscious subjectivity is invoked by how an uncertain physical system responds to and exploits uncertainty to survive. Broadly this involves quanta, unstable systems at the edge of chaos with a butterfly effect, biogenesis, prokaryotic life, eucaryote sentient consciousness and organismic consciousness with an option on biospheric evolution through volitional survival and finally the universe as a whole. There is no more parsimonious conclusion. It is not a "preferred partition". It is a universal manifestation. One criterion, which is essentially physical and not confined to biological systems only.

Cathy R: And you also need to explain how these subjective qualities evolve to produce conscious individuals, and do so in a manner which isn't intrinsically circular or self-contradictory.

Chris K: Evolution selects conscious organisms which benefit from volitional adaption to existential threats beyond computability and memorisation, and strategic advantages e.g. in food.

Cathy R: What is your evidence that all matter has some sort of subjective state?

Chris K: We have three possibilities:

1. **Matter has no subjective aspect.** This fails the explanatory gap causing the hard problem of consciousness, and evidence of volition, and is thus cosmologically untenable. No attempts to skirt round it assuming that the easy problems will eventually solve the hard problem show signs of even eventual success and are category errors.
2. **Some matter has "consciousness".** This leads to various forms of complexity theory such as Tononi and Koch's IIT Integrated information theory. These are also untenable because there is no real idea of where and when complexity becomes subjectively conscious. But even these are actually pure materialistic theories coopting some qualitative features of how human consciousness works e.g. Graziano's AST attention schema theory.
3. **All matter has "consciousness".** Subjectivity is intrinsic to cosmology, complementing the physical universe, so matter must have mind in some root form. An extreme form is Vedanta where matter is emergent from pure consciousness and is central to all mystical traditions underlying religion. SBoC is strongly aligned with this approach. Symbiotic Existential Cosmology takes a middle view summed up as "Consciousness is primary but the universe is necessary", reflecting empirically how our experience actually manifests primarily through subjective consciousness and only then through our consensual view of the physical universe.

Both (1) and (2) fail on grounds of both outright untenability and lack of parsimony. (3) does not. It is manifestly tenable since we know we are subjectively conscious and are so primarily over assumptions about the external world. It is also the most parsimonious because (1) and (2) have no way to explain consciousness without crippling complexity arguments which fail the recomposition test – how does an unconscious system below the threshold become suddenly conscious above it?

I would point out also that, at the root phenomenal level of a single quantum, subjective "consciousness" is represented physically in its wave function extending and potentially entangled throughout space-time, and the volition, or free will, is represented in wave function collapse, which in each single case is indeterminate physically so corresponds "informationally" to free will. The very independence of each collapse guarantees conformity to the wave probability interpretation unless two particles are entangled and hence correlated. This thus solves both the conscious awareness question and the volitional or free will question succinctly, tenably and parsimoniously.

Cathy R: How does your theory solve the decombination problem?

There is no decombination problem for biological organismic consciousness in SEC since it is not a form of cosmopsychism because primal subjectivity is effectively quantum subjectivity, not cosmic consciousness. So organismic consciousness is not decomposed cosmic consciousness. The physical form of organismic consciousness is a unified quantum fractal process in which all the parts are acting coherently in the overall physical aspect, so it doesn't decompose either. Cosmic consciousness is something which is approached asymptotically in moksha states, such as

samadhi, so it is an emergent form of organismic consciousness converging to a cosmic form. There is thus no state of decombination occurring. This also applies to butterfly effect physical systems, where the overall dynamic is coherent.

But I don't class Symbiotic Existential Cosmology as part of panpsychism at all, because it is a cosmologically empirical discovery, not a philosophical argument.

In Darwinian panpsychism, we don't start with a fully developed cosmic mind, we start with primary compliant subjectivity, responsive to quanta, uncertainty-sensitive systems and biogenesis. Then the evolution of life generates excitable prokaryote cells and attentively sentient eucaryote cells through endo-symbiosis, freeing the cell membrane for attentive consciousness, shaping primary subjectivity, then brains and then organismic consciousness and only then can organismic consciousness asymptotically approach fully fledged cosmic consciousness, through idling in neutral in moksha samadhi into an abstract form of subjectivity reflecting the cosmological condition, as a culmination.

This turns the God/cosmic mind logic backwards. Transcendence emerges from the biota. We don't start with divinity, we end with it if we protect diversity. Shiva and Shakti are pulling themselves up by their bootstraps through virility, fecundity and fertility.
